The management of the oldest of English hospitals was united, in 1782, with that of four other charitable institutions of the same kind in London, namely, Bethlehem, St. Thomas's, Christ's Hospital, and Bridewell. The union was effected under the Act 22 George III. c. 77, and from it the joined institutions were called "the five royal hospitals," their superintendence being placed under "the pious care of the lord mayor of London." Only three out of the "five royal hospitals," St. Bartholomew, Bethlehem, and St. Thomas, now remain institutions in the same sense, the other two, Christ's Hospital and Bridewell, having been diverted entirely from their original design. Bethlehem Hospital, like St. Bartholomew's originally a priory, founded in 1247, under the name of St. Mary of Bethlehem, by Simon Fitz Mary, sheriff of London, was given, with all its revenues, by Henry VIII. in 1547, to the city of London, as a hospital for lunatics. With the exception of an institution of the kind previously founded in Granada, Spain, it was the first lunatic hospital in Europe, and as such acquired large fame, though for a long time not well deserved, the unhappy inmates being treated more like caged animals than human sufferers. Bethlehem Hospital had its first site in Bishopsgate Street, from which it was transferred to Moorfields, in the city of London, in 1675, and finally to its present place, St. George's Fields, Lambeth, in 1814. The income of Bethlehem Hospital in the year 1876 amounted to £25,184. More wealthy than Bethlehem, and with revenues equal to those of St. Bartholomew, is the third of the "royal hospitals," St. Thomas, likewise originally a priory, and converted into a hospital in 1553. The old building, in Southwark, near London Bridge, was levelled to the ground in 1862, to make room for the South-Eastern Railway, when a new and larger edifice was erected in Stangate, Lambeth, facing the Houses of Parliament, and opened in 1871. Of the two converted "royal hospitals," the first, Christ's Hospital, Newgate Street, London, founded in 1553, is solely devoted to the education of upwards of a thousand boys, out of revenues of about £58,000 per annum; while the second, Bridewell Hospital, has become an industrial school, its annual income of nearly £15,000 being employed in the training of 150 boys and as many girls, under a scheme settled in 1860 by the "Charity Commissioners of England and Wales."

Revenues of hospitals.

There are no official statistics regarding either the total number of hospitals in England, or their revenues, the great majority of these institutions being maintained by voluntary contributions, and therefore, as previously mentioned, by law exempt from the supervision of the Charity Commissioners. In a few provincial towns, such as Salisbury, Cambridge, Bristol, Winchester, and York, there are hospitals dating back to the first part of the 18th century, and with more or less considerable revenues; but otherwise the metropolis is the chief home of all these charitable institutions, both on account of its wealth, and in connection with the study of medicine necessarily demanding centralization. Besides the "royal hospitals" there are others, endowed and unendowed, possessed of large revenues. Foremost among them stand Guy's Hospital, Southwark, founded in 1721, which has an annual income from investments of over £40,000, and relieves 5000 in-patients and 85,000 out-patients in the course of the year; and the London Hospital, established in 1740, and supported mainly by voluntary contributions, which maintains 6300 in-patients and 46,000 out-patients, at a cost of £44,700 per annum. Among the other principal metropolitan hospitals are that of Westminster, founded in 1719, with an annual income of £13,000 per annum, relieving 2000 in-patients and 20,000 out-patients; St. George's, at Hyde Park Corner, opened 1733, disbursing £28,000 a year for 4000 in-patients and 17,000 out-patients; and the Royal Free Hospital, Gray's Inn Road, which spends £22,000 in relieving annually 2000 in-patients and 26,000 out-patients. There were altogether 115 hospitals in the metropolis at the end of 1877, of which number 16 ranked as "general" hospitals, for the treatment of all diseases, while the rest were devoted to special maladies or infirmities. To aid in the maintenance of all these institutions, involving an aggregate expenditure of over a million sterling per annum, there has been made, since 1873, in the middle of June an annual collection in most of the churches and chapels of London, known as that of the "hospital Sunday." The collection produced over £25,000 in June, 1877, and not much less in the preceding years. The receipts of 1877 were distributed among seventy-six general and special hospitals, including four medical institutions and forty-three dispensaries, the former receiving £22,747, and the latter £2223. In addition to the "hospital Sunday" there was started in the metropolis, in 1875, a "hospital Saturday" collection made later in the year, the object being to let the so-called working classes contribute to institutions maintained almost exclusively for their own benefit; but the receipts in 1876 and 1877 were comparatively small, with large expenses of collection.

Endowed charities of England.

Endowed Charities.—While no authentic information exists regarding the number and income of the charitable institutions maintained by voluntary contributions, the Charity Commissioners for England and Wales have issued from time to time, in their reports to parliament, accounts of the financial state of the endowed charities placed under their control. Appended to one of these reports, issued in June, 1877, was a series of tabular summaries, giving an account of the income, both from landed property and invested funds, of all the endowed charities under the superintendence of the commissioners in England and Wales. Of these the table on p. 231 is an abstract.

Property of endowed charities.

It will be seen from the table that the endowment of the mass of the charities is mainly in land. The total area of land belonging to the endowed charities at the date of the report, June, 1877, amounted to 524,311 acres, which brought an annual rental of £1,443,177. Rent charges and fixed annual payments for land produced a further sum of £115,073, bringing the total income from real estate up to £1,558,250. The annual income from personalty in 1877 amounted to £640,213, produced from £17,418,250 of invested stock and £2,197,478 of other investments. Calculated at the rate of 4 per cent. interest, the total revenue of the endowed charities of England and Wales represented, in 1877, a capital of close upon fifty-five millions sterling.

Trustees of charitable funds.

Under the provisions of the Charitable Trusts Act of 1853, the personalty of the endowed charities has to be gradually transferred to the "Official Trustees of Charitable Funds," consisting of two persons appointed by the lord chancellor, who are invested with large powers both of transferment and re-transferment. Under very slow but steady progress, the work has been going on since the year 1854, and according to the twenty-fourth annual report of the Charity Commissioners, issued in 1877, the total sum of stocks and investments held by the "Official Trustees" at the end of 1876 amounted to £7,179,942, after deducting a sum of £837,430 as re-transferments.

Division of charities as to origin.

The vastness of the work of the Charity Commissioners and "Official Trustees" is shown by the fact that the seven millions sterling standing in the names of the latter at the end of the year 1876 were divided in no less than 8244 separate accounts.

The annual income of upwards of two millions sterling divided among the endowed charitable institutions of England and Wales may be thus analyzed as to origin:—

	£
Income of charities in London and Westminster, including city companies	228,764
" other local charities	1,314,914
" general charities	654,783
Total	2,198,461

The principal objects to which this annual income is devoted were stated as follows in the twenty-fourth annual report of the Charity Commissioners, issued in 1877:—

Classification of Charities as to Objects.

Objects of Endowed Charities.	Annual Income.
Education, including apprenticing, etc.	£754,728
Clergy and lecturers of Church of England	90,843
Other Church purposes	112,895
Nonconformists—chapels and ministers	38,832
Parochial and other public uses	66,875
Asylums and almshouses	552,119
Hospitals and dispensaries	199,140
Distribution amongst the poor	383,029
Total	£2,198,461

Educational charities.

Educational Charities.—It will be seen from the preceding statement that about one-third of the total annual income of endowed charities of England and Wales is for purposes of education. The sum probably represents but a fraction of the actual amount devoted to education, since the majority of the institutions promoting it depend either wholly or in part upon voluntary contributions, and very few of them are largely endowed. Among the more important charities for educational purposes are the Society for Promoting Christian Knowledge, founded in 1698, the income of which in 1876 was £52,851, including legacies of £16,000; the National Society, established in 1811, under which are 13,000 schools, which had an income of £26,931 in 1876; and Dulwich College, founded by Edward Alleyn in 1619, and reorganized by Act of Parliament in 1858, which has an annual income of over £16,000. As before mentioned, the English Universities and colleges, as well as the schools of Eton and Winchester, together with all cathedral foundations, are specially exempt from the control of the Charity Commissioners, and no account is therefore given in the annual reports of their revenues.

Asylums and almshouses.

Asylums and Almshouses.—While one-third of the annual income of the endowed charities is for educational purposes, one-fourth is for the maintenance of asylums and almshouses. These charitable institutions are numerous all over England, and many of them of ancient date, but the incomes of the majority of them are very small. In the metropolis alone there are over 100 asylums and almshouses, and the total number of them in England and Wales is considerably more than 1000. Among the most notable of these institutions are the Charter House of London, established in 1611, which has an annual income of £25,000; the almshouses of the Mercers' Company, dating back to 1393, endowed to the same amount; and Morden College, Blackheath, near Greenwich, founded 1695, with revenues of over £10,000.

Distribution of charities and their abundance.

Distribution of Charities.—There is a curious agglomeration of endowed charitable institutions in many parts and districts of England. Thus the small town of Baldock, in Hertfordshire, has 17 charities; the village of Banstead, Surrey, 21;

and the city of Norwich, 28 different charities, mostly of ancient date. Probably a sort of competition for becoming founders of charitable institutions, with the names of the originators going down to posterity, existed in these and many more small places for some period, which led to their becoming rich in bequests, not always to the advantage of future generations, while other towns, some thickly inhabited, remained without these foundations. It is stated by the Charity Commissioners for England and Wales in their fourth annual report, published in 1877, that great reforms in the still existing irregular distribution of charities, arising from endowments, are urgently required. "The case of a parish," says the report, "has been brought to our notice, which is in possession of parochial charities to the value of upwards of £800 a year, the population of which is at present 46, of which number it is believed that only four or five sleep within the parish, and not one of whom could properly come under the designation of poor." It is estimated that the total amount raised annually for charitable purposes in England amounts to, if it does not exceed, ten millions sterling—a sum strikingly indicative, in its abundance, as of national kindness, so of national wealth.

XIV. *Savings and Wealth of the Population.*

Origin of savings banks.

Giving Alms no Charity was the title given by Defoe to a pamphlet, published in 1704, in which he recommended the establishment of savings banks as a remedy for pauperism, the cancer of which, he declared, was only increased by charitable institutions. The imaginative author of *Robinson Crusoe* thought it quite possible that parliament might order the nation to be thrifty, passing Acts "which shall make drunkards take care of wife and children, spendthrifts lay up for a wet day; make lazy fellows diligent, and thoughtless, sottish men careful and provident." A long time elapsed before Defoe's wish for savings banks was acted upon. In 1771, Francis Masères, a thoughtful philanthropist, carried a bill through the House of Commons enabling rate-payers of parishes to establish savings banks; but the bill was thrown out by the Lords, as revolutionary in its nature. Subsequently there were several private efforts to effect the same end, which met, however, with only trifling success. A savings bank for the poor, under the ill-chosen name of "Benevolent Institution," was established by the Rev. Joseph Smith at Wendover, Buckinghamshire, in 1799, on the model of a Swiss "caisse de domestiques," and a similar one by Mrs. Priscilla Wakefield at Tottenham, near London, in 1804, the title of the latter being that of "Charitable Trust." But these institutions met with no support from the people; and it was not before the year 1817, when parliament took the subject in hand, and legislated upon it, that savings banks took root in the country. The statute which effected it was Act 57 George III. c. 105 and 130, which placed all the savings banks of England and Wales under the control of the Government. In 1828, the Act was extended to Ireland, and in 1835 to Scotland; but in neither of these divisions of the United Kingdom had it to any degree the same effect as in England. For various reasons, chief among them ordinary banking facilities, savings banks never flourished greatly in Scotland, while the poverty of the country prevented them flourishing in Ireland.

Development of the system.

The extension of savings banks in England, rather slow at first, became very marked during the decennial period from 1830 to 1840, and at the end of the latter year 552 of them had been established in the country, the total deposits amounting to £21,036,190. Thenceforth the deposits rose steadily one million every year until 1846, when there came a period of decrease till 1849, followed by a further increase which lasted uninterruptedly till 1861. At the end of the latter year, the total deposits in the savings banks of England and Wales had risen to £36,855,508. The deposits in Scotland at the same date amounted to £2,537,963, and in Ireland to £2,153,004.

Progress of savings banks, 1864 to 1876.

The following table shows the amount of deposits received and paid back by trustees of the old savings banks, in England and in Wales, during every third year from 1864 to 1876, together with the sum of the total capital at the end of each year, the whole exclusive of the deposits in post-office savings banks:—

Old Savings Banks.

Years.		England.	Wales.
		£	£
1864	Received	6,580,322	177,369
	Paid	8,837,626	233,228
	Capital	33,743,143	984,910
1867	Received	5,582,409	159,069
	Paid.................	6,607,107	186,472
	Capital	30,974,031	976,621

	Paid.................	6,353,980	175,584
	Capital	31,038,029	1,029,468
1873	Received	6,344,132	242,479
	Paid.................	6,600,535	195,292
	Capital..	32,501,383	1,213,587
1876	Received	6,588,701	198,956
	Paid.................	7,034,866	257,208
	Capital	34,206,562	1,201,093

Post-office savings banks.

The facilities of the people to place their savings securely and profitably were greatly increased by the establishment of post-office savings banks, by which the number of offices taking deposits was spread, as it had never before been, all over the country. By Act 24 Vict. c. 14, passed in 1861, the postmaster-general was empowered to direct all postmasters to receive deposits of money, of not less than one shilling, for remittance to the central office at St. Martin's-le-Grand, London, to be repaid on demand, with 2½ per cent. interest per annum. The first of the new post-office savings banks were opened throughout Great Britain on the 16th September, 1861, and their progress since that time is shown in the subjoined table, which gives the number of offices open, the number of deposits, and the amount of deposits, in years and periods of years, from 1861 till 1876:—

Years and periods of Years.	Number of Banks.	Number of Deposits.	Amount of Deposits.
From 16th Sept., 1861, to 31st Dec., 1862	2535	639,216	£2,114,669
1863	2991	842,848	2,651,209
1864	3081	1,110,762	3,350,000
1865	3321	1,302,309	3,719,017
Average of 5 yrs. 1866–70..	3815	1,802,031	5,232,108
1871	4335	2,362,621	6,664,629
1872	4607	2,745,245	7,699,916
1873	4853	2,917,698	7,955,740
1874	5068	3,044,692	8,341,256
1875	5260	3,132,433	8,783,852
1876	5448	3,166,136	8,982,350

Aggregate deposits in savings banks.

The total number of both old and post-office savings banks open at the end of the year 1876 was 5912, and the total number of depositors 3,195,761. At the 20th November, 1876, there were 1,493,401 accounts open with the old savings banks in the United Kingdom, and the amount owing to depositors was £43,283,700, being an average of nearly £29 for each depositor. The amount deposited in post-office savings banks at the end of 1876, in the name of 1,702,374 depositors, was £26,996,550, an average of £15 17s. (see page 217).

Distribution of savings over England and Wales

It appears from the detailed annual returns of the old savings banks, which, notwithstanding the wide-spread competition of the post-office, still hold over 34 millions of savings of the lower classes, that these savings are made in very unequal proportions throughout England and Wales. They are largest, as may be expected, in Middlesex, where the deposits amounted at the end of 1876 to £5,347,217; but Lancashire came very near it, with deposits of £5,302,982. The county of York stood next, the deposits at the date amounting to £3,960,754; while three more counties showed deposits of over a million, namely, Devonshire, £1,950,303, Cheshire, £1,235,084; and Northumberland, £1,166,086. As a rule, the manufacturing counties of England show a far larger amount of savings, per head of population, than the purely agricultural counties, which may be sufficiently explained by the lowness of wages in the latter. In two counties of England, Huntingdonshire and Rutland, there were no savings banks of the old establishment in 1876;

and the same was the case in two counties of Wales, Anglesey and Merionethshire. In Wales in general the savings are far below those in England. There were in the old savings banks of Carnarvonshire only 702 depositors at the end of 1876, being one in 152 of the population. The proportion at the same date for the whole of England and Wales was one depositor in every 21 of the population, and for Wales alone one in every 37.

Assessments to income tax, 1843 to 1875.

Assessments to Income Tax.—While the statistics of the savings banks serve as valuable indications of the growth of habits of thrift among the lower classes, they furnish little or no information of the progress of national wealth. It is naturally impossible to measure this progress with any approach to accuracy, but fair estimates towards it may be drawn from the income tax returns. Originally instituted in 1799, to defray the expenses of the war against France, the income tax was levied from that date till 1816, when it ceased, the motion for its renewal having been defeated in the House of Commons by a large majority. The tax was re-imposed in 1842, by Act 5 and 6 Vict. c. 35, and renewed at intervals, but with constant changes in the amount taxed per pound of income. In the first financial year of its being levied, ended April 5, 1843, the total annual value of property and profits assessed in England and Wales was returned at £227,710,444; but the amount sank to £221,101,717 in 1844, and £220,464,968 in 1845, while it reached again £227,863,132 in 1846. There was a rapid increase, scarcely checked for a few years, at intervals from this date for the next twenty years. In the financial year ending 1848, the total annual value of property and profits assessed to the income tax in England and Wales had risen to £229,868,226, in 1851 to £230,419,304, in 1854 to £256,333,899, in 1857 to £261,069,680, and in 1860 to £282,312,309. The increase from this time up to the financial period ended April 5, 1875—the last year for which returns have been published in January, 1878—is shown in the subjoined table, which gives the total annual value of property and profits assessed to income tax in England and Wales, as well as in the United Kingdom, during each of the fifteen years from 1861 to 1875:—

Years ended April 5th.	England and Wales.	United Kingdom.
1861	£282,248,060	£335,654,211
1862	295,894,976	351,745,241
1863	302,828,234	359,142,897
1864	313,639,959	371,102,842
1865	335,175,427	395,828,680
1866	350,277,476	413,105,180
1867	358,437,953	423,773,568
1868	365,366,419	430,368,971
1869	370,070,360	434,803,957
1870	379,310,635	444,914,228
1871	398,506,773	465,594,366
1872	413,223,690	482,338,317
1873	439,803,156	513,807,284
1874	463,470,571	543,025,761
1875	481,774,580	571,056,167

Division of incomes into classes.

Under the Act of 1842 which instituted the income tax, all incomes were ordered to be taxed under five classes, or schedules, marked by the first five letters of the alphabet. Schedule A was to comprise all incomes from ownership of lands, tenements, and tithes; schedule B, all incomes from occupation of lands and tenements; schedule C, all incomes from public dividends and annuities; schedule D, all incomes from trades and professions; and finally, schedule E, all incomes from Government offices and pensions. The annual value of each of these classes increased in the fifteen years from 1861 to 1875, but in very unequal proportions. The least increase was in the incomes under schedule B, arising from the occupation of lands and tenements, not amounting to more than 25 per cent. during the period, while there was but a slightly larger increase in the incomes under schedules C and E, the former comprising dividends and annuities, and the latter public salaries and pensions. On the other hand, the incomes under schedule A, from ownership of lands, more than doubled in England and Wales in the course of the fifteen years from 1861 to 1875; and the incomes under schedule D, from trades and professions, were not far from trebling during the same period.

The following table exhibits the gradual rise in annual value of these two classes of incomes in England and Wales during the fifteen years 1861 to 1875:—

Incomes from Land, and from Trades and Professions.

Years ended April 5th.	Incomes under Schedule A. Ownership of Lands and Houses.	Incomes under Schedule D. Trades and Professions.
1861	£114,058,538	£81,531,326
1862	120,124,206	85,208,610
1863	121,328,434	88,809,996
1864	122,993,875	96,982,709
1865	131,341,499	106,898,319
1866	135,144,462	115,601,940
1867	110,696,900	147,678,722
1868	116,341,387	147,576,240
1869	117,907,336	149,451,289
1870	119,429,807	154,174,613
1871	124,814,412	164,058,371
1872	125,896,143	176,447,374
1873	127,271,923	198,172,490
1874	131,084,816	214,808,581
1875	132,720,684	229,396,892

The annual value of the incomes assessed under schedule A in the year 1875 was £16,716,474 in Scotland, and £12,994,735 in Ireland, the aggregate for the United Kingdom being £162,431,893, so that England represented more than three-fourths of the total. Under schedule D, the annual value of the incomes in 1875 was £27,412,223 in Scotland, and £10,133,323 in Ireland, making an aggregate of £266,942,347 for the United Kingdom, and leaving not far from six-sevenths to the share of England and Wales.

Growth of the national income.

Growth of National Income.—The income tax returns given in the preceding tables furnish important materials for ascertaining, if only approximately, the national income of England. They show, first of all, that it is not only growing, but growing at an enormous rate. This is conclusively proved by the returns of the aggregate annual value of the incomes assessed under schedule D, comprising the gains derived from trades and professions, including in the same the profits from such undertakings as mines, railways, canals, and gas and water works. It is said, with truth, that these incomes under schedule D are "the true gauge of the prosperity of the nation;" and if this be admitted, the people of England are growing vastly in prosperity. In the fifteen years from 1861 to 1875, the increase in the annual value of the incomes of England and Wales taxed under schedule D was no less than £147,865,566, being at the rate of £9,857,704 per annum. In Scotland, during the same period, the increase of incomes under schedule D was at the rate of £1,269,298 per annum, and in Ireland at the rate of £353,135; while in the whole of the United Kingdom it was at the rate of £11,480,138 per annum.

Amount of accumulated wealth.

Accumulated Wealth.—There have been many attempts made to estimate the amount of capital, or of accumulated wealth, of the country in recent times, and the rate at which it is increasing. One of the most recent, as well as most valuable of these estimates, was contained in an elaborate paper by Mr. Robert Giffen, head of the statistical department of the Board of Trade, read before the Statistical Society of London on the 15th of January, 1878. Taking the income tax returns, down to the year ended March 31, 1875, the latest for which particulars were published, for the basis of his calculations, Mr. Giffen arrived at the conclusion that "the total capital of the people of the United Kingdom may be reckoned at a minimum of 8500 millions sterling," this being "the capitalized value of the income derived from capital," or, in other words, the accumulated wealth of the nation.

> "It is a bewildering figure," says Mr. Giffen, "about eleven times the amount of our national debt, which may thus be reckoned with all soberness as a fleabite. Nearly 7500 millions out of this amount besides must be reckoned as income-yielding, only the remaining 1000 millions being set down as the value of movable property or the direct property of imperial or local authorities, which does not yield any individual revenue. The suggestion may perhaps be made that to some extent these are only figures in an account—that the capital outlay on the soil, plant, machinery, factories, and houses of England, or on the circulating capital of English industry, would not come to so

much. But in reply I would say that, while there is no evidence one way or the other as to what the outlay has been, while we shall never know what it has cost from generation to generation to give us all this inheritance, there is some justification for thinking that the values are stable and not transitory. They represent an estate on which thirty-four millions of people have facilities for production and distribution, which must be equal all in all to the facilities existing anywhere else, because they are constantly tried in the furnace of free trade, and are not sustained by any adventitious means. If certain properties have acquired what is called a monopoly value, it is because actual workers are able to pay the corresponding rent out of their first earnings, and have ample wages and profit besides. In such matters the property of a great country, like a factory or business, must be valued as that of a going concern, and the monopoly value which certain things acquire only enters into the question of the distribution of the estate and its income."

Growth of capital in the present century.

As regards the growth of capital in the course of the first three quarters of the present century, Mr. Giffen's calculations showed that it had been going on at an ever-increasing rate, the greatest increase taking place in the decennial period from 1865 to 1875. The following table was published by him as an approximate account of the capital and property existing in the United Kingdom, distinguished as assessed and not assessed to income tax, in each of the years 1865 and 1875, given in millions of pounds, with the amount and percentage of increase in the ten years:—

Capital and Property.	1865.	1875.	Increase in 1875.	
			Amount.	Per Cent.
ASSESSED TO INCOME TAX.	Millions.	Millions.	Millions.	
Lands	1864	2007	143	8
Houses	1031	1420	389	38
Farmers' profits	620	668	48	8
Public funds, less home funds	211	519	308	146
Mines	19	56	37	195
Ironworks	7	29	22	314
Railways	414	655	241	58
Canals	18	20	2	11
Gasworks	37	53	16	43
Quarries	2	4	2	100
Other profits	55	84	29	53
Other income-tax, principally trades, professions, and companies	659	1128	469	71
Total	4938	6643	1706	35
NOT ASSESSED TO INCOME TAX.				
Trades and professions omitted	75	105	30	40
Income from capital of non-income-tax paying classes	200	300	100	50
Foreign investments not in Schedules C and D	100	400	300	300
Movable property not yielding income	500	700	200	40
Government and local property	300	400	100	33
Grand Total	6113	8548	2436	40

Distribution of the increase of wealth.

In the concluding part of his paper, Mr. Giffen entered upon the difficult task of estimating the distribution of the increase of wealth both in the three divisions of the United Kingdom and among classes, premising that "it would be difficult to find sufficient details, owing to the large amounts of income which are earned in one part of the country and pay income tax in another.

"The great increase," he goes on to say, "both in amount and per head of population is undoubtedly in England, although the income tax returns show clearly enough that both Ireland and Scotland now progress very rapidly. In another aspect, viz., as to whether capital is being more diffused, or is accumulating in fewer hands, I am afraid the data are not sufficiently good for any sure conclusions. There are certain means for comparing the number of assessments under Schedule D, at different amounts of income, which would appear to show that the number of large incomes is increasing more quickly than the increase of population or the increase of wealth. But the fact of the rich class becoming a little more numerous, would not prove that, as a whole, the number of people possessed of moderate capital, and the average amount they possessed, are increasing or diminishing, while the increasing number of company assessments under Schedule D makes the number of assessments altogether useless for comparison, as we have no information whatever respecting the number of individual shareholders in the different companies, the average amount of each individual interest, and the interests of the holders in Schedules A, B, and C."

Influence of depression of trade upon capital.

As regards the important question whether there has been an accumulation of capital in recent years, subsequently to 1875, marked by great depression of almost all branches of trade and industry, Mr. Giffen's conclusions were that the process of growth continued uninterruptedly. He expressed his conviction "that in no year is the accumulation absolutely at an end, and that in many directions it is even more active in dull years than it is at other times. We know, for instance, that the capital outlay on railways is incessant; that during the last two or three years of depression, and even now, the nation is saving in railways very nearly as much as the annual income of the capital invested in them. In agriculture again, there is a constant annual reclamation of land in progress, besides an incessant outlay on the older cultivated area. . . . The truth is that, owing to the division of labor, there must be a vast disorganization of industry, not a mere temporary falling off from a former inflation, before accumulation can be wholly checked. A certain portion of the community is told off, as it were, to create the accumulations, and if the accumulations were not made, we should see in the building trades, in railway construction, in shipbuilding, and numerous other directions, a widespread stoppage of works, and masses of unemployed laborers, far exceeding anything witnessed even in those terrible times of depression which were frequent before the free trade period, when industry was partially disorganized, and pauperism assumed most threatening dimensions. In the absence of the effects which would follow, we must assume that the cause is not present, that there is no stoppage of accumulation; but that accumulation, on the contrary, goes on at present in most directions at an average annual rate, or at a rate greater than the average.

England's position in the world.

Another eminent political economist and statistician, the late Mr. Dudley Baxter, who read a paper on the "National Wealth of the United Kingdom" before the Statistical Society of London on the 21st of January, 1868, just ten years before Mr. Giffen, took a far less hopeful view than the latter about the constancy of increase of the national wealth. He expressed his belief that, while "the income of England is the largest of any nation, and shows wonderful good fortune and prosperity, we must not forget that it rests on an unstable foundation. The turn of trade, or obstinacy and short-sightedness in our working-classes, or a great naval war, may drive us from the markets of the world, and bring down our auxiliary as well as our productive industries." Mr. Dudley Baxter wound up his conclusions with an eloquent warning. "England's position," he exclaimed, "is not that of a great landed proprietor, with an assured revenue, and only subject to occasional loss of crops or hostile depredations. It is that of a great merchant who, by immense skill and capital, has gained the front rank, and developed an enormous commerce, but has to support an ever-increasing host of dependants. He has to encounter the risks of trade, and to face jealous rivals, and can only depend on continued good judgment and fortune, with the help of God, to maintain himself and his successors in the foremost place among the nations of the world."

XV. *Government and Laws.*

Nature of the English constitution.

As England stands alone in the greatness of her wealth, the extent of her commerce, and the vastness of her manufactures, so also does she hold a unique place among nations as regards her government. Under the nominal form of an hereditary monarchy, with restricted powers, the nation is actually governed by two Houses of Parliament, whose laws, when assented to by the sovereign, form the statutes of the realm. It has been already remarked in the article CONSTITUTION AND CONSTITUTIONAL LAW that, in respect of her government, "England differs conspicuously from most other countries. Her constitution is to a large extent unwritten, using the word in much the same sense as when we speak of unwritten law. Its rules can be found in no written document, but depend, as so much of English law does, on precedent modified by a constant process of interpretation." One of the most thoughtful of modern political writers, the late Mr. Walter Bagehot, sketched, in perhaps fewer words than any other, the nature of this unwritten and constantly modified constitution in its most recent aspect. "The efficient secret of the English constitution," he says, "may be described as the close union, the nearly complete fusion, of the executive and legislative powers. According to the traditional theory, as it exists in all the books, the goodness of our constitution consists in the entire separation of the legislative and executive authorities; but in truth its merit consists in their singular approximation. The connecting link is *the Cabinet*. By that new word we mean a committee of the legislative body selected to be the executive body. The legislature has many committees, but this is its greatest. It uses for this, its main committee, the men in whom it has most confidence. It does not, it is true, choose them directly; but it is nearly omnipotent in choosing them indirectly.” It is a striking illustration of the fact of the constitution of England being “unwritten” that the Cabinet, though universally and undisputedly admitted to represent the Government of the country, remains utterly unknown as such both to the written law and the legislature. The names of the persons who compose the Cabinet for the time being are never officially announced, nor are there even any official records of its meetings, or of the resolutions which may have been come to at them by the members. Strangest of all, the Cabinet, virtually nominated by the legislative body, and depending for its existence on a majority of supporters in it, has never yet been formally recognized by any Act of Parliament.

Power and jurisdiction of Parliament.

Although the assumption of the executive by a committee of the legislature is of comparatively modern date, forming, as Lord Macaulay says, “the great English revolution of the 17th century,” the supreme authority of parliament is of ancient date, forming a part of the common law of the realm. “The power and jurisdiction of parliament,” Sir Edward Coke laid down the rule, “is so transcendent and absolute that it cannot be confined, either for causes or persons, within any bounds.” With equal emphasis, Sir William Blackstone added that to parliament “that absolute despotic power, which must in all governments reside somewhere, is entrusted by the constitution of these kingdoms.” In constitutional fiction, parliament consists of three “estates of the realm,” namely, first, the Lords Spiritual, secondly, the Lords Temporal, and thirdly, the Commons; but the more modern form of division is that into two Houses, described as the Upper and Lower, or that of the Lords and the Commons. (See PARLIAMENT.) Strictly speaking, a member of the Upper House is a parliamentary representative equally with one of the Lower House, but in ordinary language, representing, as often it does, great facts, the title of “member of parliament” is only given to members of the House of Commons.

The House of Lords.

The Upper House, or House of Lords, consists of a varying number of members as regards the representation of England, but fixed with respect to Scotland and Ireland. In the official “Roll of the Lords Spiritual and Temporal,” issued at the commencement of the parliamentary session of 1878, the number of members of the Upper House was returned at exactly 500, the list comprising 5 members of the royal family, 2 archbishops, 21 dukes, 19 marquesses, 113 earls, 24 viscounts, 24 bishops, 248 barons, 16 Scottish representative peers, and 28 representative peers of Ireland. All the peers of England, as well as those whose patent of peerage is for the United Kingdom, have seats and votes in the House of Lords, but the peers of Scotland and Ireland are represented only by delegates, those for Scotland being elected for every new parliament and those for Ireland for life.

Peerages created since 1837.

The Government, through the sovereign, has an unrestricted power for creating new peerages, which at times has been largely used for political purposes. During the reign of Queen Victoria, up to the end of 1877, there were created 151 new peerages under various administrations. The 151 peers so created form at present more than one-third of the House of Lords, deducting from its roll the spiritual and representative members. Nearly three-fourths of the existing peerages have been created since the accession of the House of Hanover.

Functions of the House of Lords.

The actual functions of the House of Lords, as a branch of the legislature, are not very clearly defined; but it is generally assumed that it has a revising faculty over all bills passed by the Commons, except those relating to the public revenue and expenditure. As a rule, a very small number of peers take part in the work of a session, and the extremely limited attendance is signified by the rule that three members are sufficient to form a quorum in the Upper House, while there must be 40 in the Lower House. One of the reasons of non-attendance of the members of the House of Lords, is found in their special privilege of voting by proxy, instead of in person, which is largely exercised. Most of the sittings of the Upper House are not only very short, but irregular, the custom being to adjourn “during pleasure,” which means that the lord chancellor, or the deputy speaker, may, in the exercise of his discretion, two other peers being present, take his seat on the woolsack, and order business to proceed at any hour during the day. Besides its legislative functions, the House is invested with high judicial powers, forming the supreme court of appeal in the realm.

The House of Commons.

If nominally inferior to the Upper House, the Lower House of legislature, or House of Commons, stands above it in actual power and authority. It is a power constantly on the increase, and tending to absorb all others, having proved the most auspicious for Government.

> “Whatever may have been the circumstances,” says Dr. Hearn, of Melbourne, in his elaborate work on the government of England, “which led to the gradual formation of parliamentary government, the cause of its continuance is clear. In practical politics, as in every other art, the great test of excellence is success. But in at least British communities, the success of parliamentary government does not admit of doubt. As Edward I. found the supplies voted by the representatives of his burgesses more profitable than the tollages at which he assessed their constituents, so experience has shown to later sovereigns the great advantage to their government of our modern system. Where in former times the only remedy for misgovernment, real or supposed, was a change of dynasty, the evil is now corrected at no greater cost than that of a ministerial crisis. Where in former times serious evils were endured because the remedy was worse than the disease, even trivial inconveniences now excite universal complaints, and meet with speedy remedy.”

Length of sessions of the House of Commons.

Although politically omnipotent, the House of Commons cannot prolong its own existence beyond seven years. The average duration of parliaments in the present century has been three years and eight months, a term almost exactly coinciding with the average duration of Cabinets within the period. The following table gives the dates at which the parliaments of the United Kingdom—dating from the union of Great Britain with Ireland, which took effect on the 1st of January, 1800—met and were dissolved:—

Reign.	Parliament.	Met.	Was dissolved.
George III...	1st	27 Sept., 1796	29 Jan., 1802
“ ...	2d	31 Aug., 1802	24 Oct., 1806
“	3d	15 Dec., 1806	29 Apr., 1807
“	4th	22 June, 1807	24 Sept., 1812
“ ...	5th	24 Nov., 1812	10 June, 1818
“	6th	4 Aug., 1818	29 Feb., 1820
George IV....	7th	23 Apr., 1820	2 June, 1826
“ ...	8th	14 Nov., 1826	24 July, 1830
William IV...	9th	26 Oct., 1830	22 Apr., 1831
“ ...	10th	14 June, 1831	3 Dec., 1832
“ ...	11th	29 Jan., 1833	30 Dec., 1834
“ ...	12th	19 Feb., 1835	18 July, 1837
Victoria.......	13th	14 Nov., 1837	23 June, 1841
“ ...	14th	11 Aug., 1841	23 July, 1847
“ ...	15th	21 Sept., 1847	1 July, 1852
“ ...	16th	4 Nov., 1852	20 Mar., 1857
“ ...	17th	30 Apr., 1857	23 Apr., 1859
“ ...	18th	31 May, 1859	6 July, 1865
“ ...	19th	6 Feb., 1866	31 July, 1868
“ ...	20th	10 Dec., 1868	24 Jan., 1874
“ ...	21st	5 Mar., 1874	....

The shortest-lived House of Commons was the third of the United Kingdom, which existed only for four months and fifteen days, while the longest was the seventh, which sat six years one month and nine days, thus reaching nearly the extreme limit of age set to parliament by the constitution of the realm.

Constitution of the House of Commons.

The constitution of the House of Commons, in its present state, as framed by the Reform Bills of 1832 and 1867–68, is that of a body elected by nearly universal suffrage, but in very unequal electoral divisions. Under the English Reform Act of 1867, extended, with slight changes, to Scotland and Ireland in 1868, the franchise was given to all householders in boroughs, and occupiers of lands or houses rated at no less than £12 in counties, thus admitting to the right of electing members of parliament the majority of the adult male population, with the sole exception of the class of agricultural laborers. The elections, under an Act passed in 1872, take place by secret vote and ballot. It appears from an annual return made by order of the House of Commons that, at the end of June, 1877, the total number of its constituents in England and Wales amounted to 2,377,761, while in Scotland at the same date the number was 302,313, and in Ireland 231,265. The number of members returned, respectively, for the counties, boroughs, and universities of each of the three divisions of the United Kingdom, with the number of electors on the register, was as follows at the end of June, 1877:—

Divisions.	Members of Parliament.	Electors on register.
ENGLAND AND WALES.		
52 counties	187	850,587
200 cities and boroughs	293	1,514,716
3 universities	5	12,458
Total, England and Wales	485	2,377,761
SCOTLAND.		
33 counties	32	88,594
22 cities and burgh districts	26	202,852
4 universities	2	10,867
Total, Scotland	60	302,313
IRELAND.		
32 counties	64	173,919
33 cities and boroughs	39	53,953
1 university	2	3,393
Total, Ireland	105	231,265
United Kingdom	650	2,911,339

It is stated in a recent parliamentary return that, if the allotment of members of parliament to each of the three divisions of the United Kingdom were regulated solely by population, on the basis of the last census, England and Wales should have 493, Scotland 60, and Ireland 97 representatives; while if the allotment were made according to contributions to the public revenue, England and Wales should have 514, Scotland 79, and Ireland 57 members.

The Cabinet.

It has become the most important function of the House of Commons in modern times to appoint the Government for the time being, and, more immediately, those leading members of the Government, headed by the prime minister, known as the Cabinet. Far reaching as is the legislative authority of the elected representatives of the nation, it naturally must stand in the background of this higher power of choosing the rulers of the country, since the latter, besides guiding the executive, likewise are the more immediate framers of all the laws that are passed. "The legislature," says Mr. Bagehot, in his already quoted work, "chosen, in name, to make laws, in fact finds its principal business in making and in keeping an executive." It has come to be tacitly understood that the leading statesman of the political party possessing a majority in the House of Commons must fill the place of prime minister, officially styled first lord of the treasury, while the other chief men of the party have a claim to become members of the Cabinet.

> "The leading minister selected," says Mr. Bagehot, "has to choose his associates, but he only chooses among a charmed circle. The position of most men in parliament forbids their being invited to the Cabinet; the position of a few men ensures their being invited. Between the compulsory list whom he must take, and the impossible list whom he cannot take, a prime minister's independent choice in the formation of a cabinet is not very large; it extends rather to the division of cabinet offices than to the choice of cabinet ministers. Parliament and the nation have pretty well settled who shall have the first places; but they have not discriminated with the same accuracy which men shall have which place. The highest patronage of a prime minister is, of course, a considerable power, though it is exercised under close and imperative restrictions, and it is far less than it seems to be when stated in theory, or looked at from a distance. The Cabinet, in a word, is a board of control chosen by the legislature, out of persons whom it trusts and knows, to rule the nation."

There is no fixed number of members for the Cabinet, any more than of regular meetings of the members admitted to it. In recent years the number of members varied from eleven to sixteen, the former, the lowest ever attained, being in 1876, under the premiership of Mr. Disraeli, just previous to his elevation to the peerage under the title of earl of Beaconsfield. All cabinets yet formed included the following nine members of the administration:—the prime minister, the lord chancellor, the lord president of the council, the chancellor of the exchequer, and the secretaries of state presiding over the departments of foreign affairs, war, India, the colonies, and home affairs. To these nine members there are usually added various others, most frequently the first lord of the Admiralty, the postmaster-general, the chief secretary for Ireland, and the president of the Board of Trade. (See also the article CABINET.)

Members of the Government.

The Cabinet does not constitute more than about one-fourth part of the executive, or what is generally called the Government. With every change of administration, necessitated by the expressed will of the House of Commons, from forty to fifty political heads of department have to quit their places, to make room for men belonging to the party which can claim a parliamentary majority. Besides the departments already mentioned, whose heads are generally, or sometimes, included in the Cabinet, there are others of great importance, such as the Committee of Council on Education, the Local Government Board, the Office of Works and Public Buildings, and the various departments for the collection of the national revenue, considered to form part of the Government, or, more correctly, the administration. The chief officers of all these branches of the administration change with the Cabinet, with the exception of the heads of the departments of the customs, excise, stamps, and taxes, who hold permanent appointments. Subject to political changes likewise are the great law officers of the crown, the lord chancellor, attorney-general, solicitor-general, and judge-advocate-general of England, the lord-advocate and solicitor-general of Scotland, and the lord chancellor, attorney-general, and solicitor-general for Ireland. These, as all the other members of the political administration, hold office "durante bene placito," instead of, as the administrators of the law, or judges, "quamdiu bene se gesserint."

The law courts of England.

In closest contact with the constitution and government of England, and similar to them in nearly every respect, are its laws and their administration. Unlike most other countries, England has no code of laws; nor would codification be easily possible, seeing that the principles which govern the national jurisprudence are, like those which lie at the basis of the constitution, as much "unwritten" as "written." Broadly, the whole body of laws may be divided into two classes, namely, first, those springing from immemorial usage, sanctified by judicial decisions, and, secondly, those springing from parliamentary enactments. The former, in their nature, take far deeper root in the national life than the latter. This is expressed by the fact that there were law exponents, or judges, long before there were law-makers, or legislators. The most ancient of English courts, that of King's or Queen's Bench—in its correct legal title, "the Court of the King before the King himself," *coram ipso rege*—was far older than parliament itself, for it can be traced back clearly, both in character and the essence of its jurisdiction, to the reign of King Alfred. Not much less ancient than "the Court of the King before the King" was the Court of Chancery, which acted for ages as the fountain of justice, the *officina justitiæ*, forming the origin of the courts of common law. The independence of the Courts of King's Bench and of Chancery was destroyed by the Judicature Act of 1871, exactly 1000 years after the accession of Alfred.

The Judicature Acts.

The Judicature Act of 1871, amended and enlarged in 1873, and in operation from the 1st of November, 1875, made very important alterations in the administration of justice in England. By its provisions, aiming centrally at a fusion of the judicature for the better distribution of judicial force, there was formed a single court, called the "High Court," divided into five departments, called respectively the Queen's Bench, the Chancery, the Common Pleas, the Exchequer, and the Probate, Divorce, and Admiralty divisions. It is in these divisions that is vested the administration of the law, while the "High Court," or, more fully, the "High Court of Justice," as such, can scarcely be said to have any existence. It is, as one of the judges described it soon after the passing of the Judicature Act, an *ens rationis*,—that is, it exists only in theory, or in contemplation of law.

General courts of law and judges.

At the head of the judicial administration of the kingdom, as at present constituted, stands the Lord High Chancellor of Great Britain, a political officer changing with the Cabinet, presiding over the supreme Court of Judicature, and forming part also of the judicial committee of the Privy Council, sitting as a court of appeal. There are annually about 100 cases heard and determined before the judicial committee of the Privy Council, and seldom less than 300 cases "remaining for hearing" or in arrears, the number tending to increase. All the judges of the divisions of the High Court form part of the judicial committee of the Privy Council, which has besides four special paid judges. President of the first of the five divisions of the High Court of Justice, the Queen's Bench, is the lord chief justice of England, under whom are four "puisne justices," while the second division, the Chancery, is presided over by the Master of the Rolls, who has at his side three vice-chancellors administering law in the vice-chancellor's courts. Within the Chancery division are the great seal patent office, and office of the commissioners of patents for inventions, the designs registry, and the trade marks registry. In the third of the divisions of the High Court, the Common Pleas, the president has the title of lord chief justice, and in the fourth, the Exchequer, that of lord chief baron, the former having under him four "puisne justices," and the latter four "puisne barons." Finally, in the fifth division, that of Probate, Divorce, and Admiralty cases, there is one president and one judge, with an admiralty advocate, queen's proctor, and an admiralty proctor. (See also COURT, vol. vi. p. 458.)

Circuits of courts of assize.

Besides the great courts of law, which, like the foregoing, have jurisdiction all over the kingdom, there are a number of courts exercising local jurisdiction within counties, boroughs, and other defined districts. Foremost among the courts of local jurisdiction are those of assize. The great inconvenience of resort by suitors from distant parts to the seat of the central courts of law led, from a very early period, to the appointment of justices "in eyre," or itinerant judges, authorized to hear civil and criminal causes within a prescribed circuit.

These circuits of assize, altered at various times, are at present seven in number, denominated respectively the South-Eastern or Home, the Midland, the Northern, the Oxford, the Western, the North Wales and Chester, and the South Wales circuits. The South-Eastern or Home circuit embraces the counties of Herts, Essex, Hunts, Cambridge, Suffolk, Norfolk, Kent, Sussex, and Surrey, the assizes being held at Hertford, Chelmsford, Huntingdon, Cambridge, Ipswich, Bury St. Edmunds, Norwich, Maidstone, Lewes, and Kingston; the Midland, the counties of Bedford, Bucks, Derby, Leicester, Lincoln, Notts, Northampton, Rutland, and Warwick, with assizes at Bedford, Aylesbury, Derby, Leicester, Lincoln, Nottingham, Northampton, Oakham, and Warwick; the Northern, the counties of Cumberland, Westmoreland, Lancashire, Durham, Northumberland, and York, the assizes being held at Carlisle, Appleby, Lancaster, Manchester, Liverpool, Durham, Newcastle, York, and Leeds; the Oxford circuit, the counties of Berks, Oxford, Worcester, Stafford, Shropshire, Hereford, Monmouth, and Gloucester, the assizes being held at Reading, Oxford, Worcester, Stafford, Shrewsbury, Hereford, Monmouth, and Gloucester; and the Western circuit, the counties of Hants, Wilts, Dorset, Devon, Cornwall, and Somerset, with assizes at Winchester, Devizes, Dorchester, Exeter, Bodmin, and Taunton. The North Wales and Chester circuit extends over Montgomery, Merioneth, Carnarvon, Anglesey, Denbigh, Flint, and Cheshire, assizes being held at Welshpool, Dolgelley, Carnarvon, Beaumaris, Ruthin, Mold, and Chester; the South Wales Circuit embraces Pembroke, Cardigan, Carmarthen, Glamorgan, Brecon, and Radnor, with assizes at Haverfordwest, Cardigan, Carmarthen, Swansea, Brecon, and Presteign. In every circuit there are at least two assizes held every year, mostly in spring and summer; but in the more populous circuits there are also winter assizes. The appointments of the judges for the various assizes are made out in the Chancery division of the High Court of Justice, the custom being to let the selection take place by mutual agreement among the members of the judicial bench.

Central criminal court and county sessions.

Among the other local courts of jurisdiction deserving notice are the Central Criminal Court of London, the Middlesex Sessions, and the Surrey Sessions. The Central Criminal Court, sitting at the Old Bailey, tries, as indicated by its name, only criminal cases, the sessions, presided over by a judge, taking place once every month throughout the year. Different in organization from the Central Criminal Court are the two metropolitan law courts, going by the names of the Middlesex Sessions and the Surrey Sessions. These courts, instituted, not only for the trial of prisoners, but for various administrative purposes, such as the licensing of public houses, and the inspection of weights and measures, are composed of county justices, or, as they are commonly called, magistrates, presided over by a chairman and assistant judge. Similar in constitution to the Middlesex and Surrey Sessions are the general and quarter sessions of other counties. They are held in the first week after March 31, June 24, October 11, and December 28, it being left to the decision of the county justices composing them to fix the exact date when they are to commence, with liberty to make such changes as shall not interfere with the holding of the assizes. The county justices, assembled in general and quarter sessions, have jurisdiction in civil and criminal actions, except, as regards the latter, cases of treason, perjury, and other heavy crimes.

Tribunals in cities and boroughs.

By the Municipal Corporation Act of 5 and 6 William IV. cap. 76, cities and boroughs in England and Wales may have a system of magisterial judicature similar to that of counties. The ordinary duties of county justices, out of sessions, are performed for most cities and boroughs by their mayors or other magistrates. By the same Act, courts of quarter sessions may also be granted to cities and boroughs. The sole judges of such courts are recorders, empowered to take cognizance of offences in the same manner as courts of quarter sessions in counties, but with a jurisdiction to levy county rates and to grant licenses, or to exercise any of the other powers vested in town councils. The recorder, who must be a barrister of not less than five years' standing, has to hold his court quarterly, or, if necessary, more frequently; and should there be an unusually large number of cases to be tried, he may, with the sanction of the town council, form a second court, under the presidency of an "assistant barrister," approved of by the Secretary of State for the Home Department.

Substitution of judges for juries.

It was long the opinion of writers on jurisprudence, foreign and English, as well as of the public in general, that one of the most manifest advantages of English law was in its general adoption of trial by jury. In recent times, however, a growing tendency has been manifested to trust, at least in civil cases, more to the administration of the law by judges than by juries. This tendency is strikingly shown in the most important juridical statutes passed lately, the Judicature Acts already referred to. There can be no doubt that on this subject the legislature expresses but public opinion, and that what is ordered by parliament in respect to changes in the administration of the English law is done by the will of the nation. Meaning of the name England.

ENGLAND.—Part II.—History.—England, the land of the Angles or English, is, according to its etymology, the distinctive name of that part of Britain in which, by reason of the Teutonic conquests in the fifth and sixth centuries, the Teutonic race and speech became dominant. The name is in itself equally applicable to the older home of the Angles in Germany; but, though cognate forms, as *Angeln*, are to be found there, the exact forms *Anglia* or *England* do not seem to have been in use. As applied to later settlements of Englishmen, settlements made by men starting from Britain, it is used with direct and conscious reference to the elder England. New England implies Old England. The name is thus etymologically applicable to English settlements anywhere; historically it belongs to the great English settlement in Britain. And, in its use for many ages past, it has not taken in the whole of that part of Britain which is historically English. Part of northern England was at an early time detached from the English kingdom to form part of Scotland. And again, from the part of England so detached, the English tongue, and much of English blood, has further spread over part of the proper Scotland. In modern usage then England means somewhat less than the land which is marked out by its strict etymology. It does not mean the whole of the Teutonic part of Britain, but only that part of it which has formed the kingdom of England since the present line between England and Scotland was drawn. But in any case it should be remembered that the name is a purely political name. Britain is a certain part of the earth's surface, with unchangeable physical boundaries. England, Scotland, Wales are political names of parts of Britain, which have had different meanings at different times, according as the part of Britain to which they have been applied has been larger or smaller. It is also to be remembered that these political names are comparatively modern. England, for instance, is not heard of by that name till late in the tenth century. In fact it hardly could have been a formal title, used in the country itself, till the many English settlements in Britain had become one kingdom. It is not, as we shall see, the oldest name for the Teutonic part of Britain. But as the various English kingdoms were fused into one, England became and remained the name of that one. England then is that part of Britain which came and remained under the direct rule of the king of the English. It thus excludes Scotland, meaning by Scotland, as by England, a greater and a smaller space at different times. It also in strictness excludes Wales. Legal phraseology is not quite consistent on this head; but the more accurate description of South Britain is "England and Wales," rather than "England" only. Wales, first under its own princes, then under the English kings, was long a dependency of England rather than a part of England; and its complete political incorporation with England has not altogether destroyed its separate character.

England then is the name which certain historical events caused to be applied to a part of the isle of Britain. The history of England therefore strictly begins with the beginning of those events which caused part of Britain to become England. The history of England has no concern with the earlier history of Britain, except so far as is needed to make the working of those causes intelligible. Nor need it dwell on the earlier history of the English before they came into Britain further than is needed for the same end. The history of England begins when the English first settled in Britain. But, in order to understand this settlement, some account must be given of the earlier condition both of the settlers themselves and of the land in which they settled.

Britain in the fifth century.

Britain, in the fifth century, the time of the settlement which gave to so large a part of the island the name of England, was in a state unlike any other part of the world. The greater part of the island, all that is now called England and Wales, with a considerable part of what is now called Scotland, had formed a Roman province, but had been cut off from the empire by the act of the imperial power itself. As the Roman legions had been a hundred and thirty years earlier withdrawn from Dacia by Aurelian, so they were in the early years of the fifth century withdrawn from Britain by Honorius. The Teutonic invaders therefore found in Britain what they did not find in Gaul or Spain, an independent people, who doubtless kept many memories and fruits of their long subjection to Rome, but who had ceased to be actual Roman subjects. The people whom the English found in the possession of this restored and somewhat precarious independence were the Celtic people of the Britons. It is not here needful to determine certain curious points of controversy, how far the purely Celtic character of the inhabitants of Britain had been modified by intermixture, either with races earlier than their own settlement or with Teutonic or other settlers during the time of Roman dominion. All the probabilities of the case would certainly go against the belief that the Celts found the isle of Britain wholly unin-

The Britons.

Question of earlier inhabitants.

Survival of the Welsh language.

habited. That they were the first Aryan settlers there can be no reasonable doubt; but even in the absence of any kind of evidence, we should expect that the first Aryan settlers would, in Britain as elsewhere, find earlier non-Aryan settlers in possession of the land. One set of inquirers have made it highly probable that the cromlechs and other primæval remains, which used to be vaguely called Druidical, are really the works of a race of inhabitants earlier than the Celts. Another set of inquirers have, from the physiological point of view, brought plausible arguments to show, not only that such an earlier non-Aryan population existed, but that it actually forms a perceptible element in the present population of South Britain. It has been argued that a large part of the population of the border shires of England and Wales is in truth neither English nor British, but comes of a non-Aryan stock akin to the Basques of Gaul and Spain. So, on the other hand, it has been argued that a part of the eastern coast of Britain had received Teutonic inhabitants earlier than the conquest of Britain by the Romans. It has been argued too, and in this case argued with undoubted certainty, that, under the Roman occupation, soldiers and other subjects and allies of the empire of various races, the Teutonic race among others, settled in the Roman province of Britain, and helped to form a part of its inhabitants. But, if all these doctrines are admitted in their fullest extent, they in no way affect the political history of England. They simply prove that the British people whom the English found in possession of the isle of Britain had, like all other nations, in all other times and places, had the purity of their blood more or less affected by foreign intermixture. They in no wise affect the fact that the English invaders found in this island a people who, for all practical and historical purposes, must be looked upon as Celtic, a people in whom the dominant blood and the dominant national being was undoubtedly Celtic. In the eye of general history they must be looked on, as they were in the eyes of their English conquerors themselves, as Britons. They were Britons modified no doubt in every respect by their long subjection to Rome, but still essentially a British, that is, a Celtic people. And it is further clear that they were a people who had been less modified by Roman influences than the inhabitants of the other provinces of the empire. This is shown by the fact that the ancient British language survived the Roman Conquest, and still remains the language of a not inconsiderable part of the isle of Britain. The mere fact of the existence of the Welsh language shows that Roman influences could not have been so strong in Britain as they were in Gaul and Spain. The military conquest and the political occupation were no doubt as complete in Britain as in any other province of the Roman empire; but the moral and social influence of Rome must have been less than it was elsewhere. In Gaul and Spain the inhabitants adopted the name, the feelings, and the speech of Rome, and handed on their Roman speech to their Teutonic conquerors. The difference between the phænomena of Britain and the phænomena of the continental provinces is plain at a glance. The speech of Gaul and Spain at this day is Latin. The exceptions are only where the earlier languages survive in obscure corners. In the lands which formed the Roman province of Britain a Latin speech is now nowhere spoken, nor is there any sign that a Latin speech has ever been spoken as the popular language at any time since the withdrawal of the Roman legions. The dominant tongue is that of the Teutonic conquerors; but part of the island, a part somewhat more than a mere corner, keeps its ancient British speech. The Roman tongue, dominant and more than dominant in Gaul and Spain, has in Britain no place at all.

Insular position of Britain.

Britain then, even if the Roman legions had not been deliberately withdrawn from it, was, at the beginning of the fifth century, in quite another case from the other provinces of the empire. Mere conquest had been as thorough as in any other frontier province; for it must not be forgotten that Britain was pre-eminently a frontier province. As the whole of Britain was never subdued, the part which was subdued always remained, like the lands on the Rhine and the Danube, exposed to the attacks of the still independent inhabitants of the island. But the usual results of Roman conquest, social and national assimilation, had been much less thorough than elsewhere even in the frontier provinces. One main cause of this difference doubtless was the geographical position of the country. A large island, an island large enough to have a separate being of its own, is far harder to incorporate or assimilate than a land which is geographically continuous with the ruling country. The history of the greater Mediterranean islands proves this, and it is still more true of great oceanic islands like our own. The British islands seem designed to form one political whole; yet it has been found impossible to unite Ireland with Great Britain in the same way in which the different parts of Great Britain have been united with one another. Britain, the most distant and geographically the most distinct of the provinces of Rome, was felt to be, and was constantly spoken of as, another world. In all ages and among all changes of inhabitants, the insular character of Britain has been one of the ruling facts of its history. Its people, of whatever race or speech, whatever their political condition at home or their political relation to other countries, have been before all things pre-eminently islanders. This must be borne in mind through the whole of British history. We are not dealing with Celts, Romans, Teutons, simply as such, but with Celts, Romans, Teutons, modified by the fact that they dwelled in a great island, which was cut off in many ways from the rest of the world, and which acted in many things as a separate world of itself.

The tyrants.

Britain given up by the Romans.

The result of this insular position of Britain was shown in many things during the time of the Roman dominion. It was remarked that no province of the empire was so fertile in tyrants. That is to say, no part of the empire produced so many of those military chiefs who, by the favor of their armies, sometimes it would seem with the good-will of the inhabitants of the provinces, set themselves up as opposition emperors, in revolt against the acknowledged prince who reigned in the Old or the New Rome, at Milan or at Ravenna. The position of these tyrants must not be misunderstood, as if they at all consciously aimed at the foundation of national kingdoms. Their object was not to lop off a province from the empire, and to form it into an independent state. Their object was the empire itself, the whole if they could get it; if not, as large a share of it as their forces would allow them to hold. An emperor who ruled in Britain was anxious, if he could, to rule also in Gaul, to rule also in Italy. But the geographical necessities of the case stepped in, and often confined the emperors who arose in Britain to a purely insular dominion. That dominion was more easily won, and more easily kept as a practically distinct power, than the dominion of any of the continental provinces. It was again doubtless due to the geographical position of Britain that it was the one province of the West from which the legions were deliberately withdrawn. They were withdrawn from one world to another. The Roman world, it seemed, might exist without the dominion of the British world. The deliberate surrender of Gaul or Spain or Africa would have been quite another matter. Those lands had become in every sense members of the Roman world, and the voluntary lopping off of any one of those members would have been an act of suicide which no one would have dreamed of. With the great island it was otherwise. While the other provinces were cut off from the empire by open or disguised foreign invasion, Britain was voluntarily given up. It was doubtless given up through fear of foreign invasion; through a feeling of inability to withstand foreign invasion; but not as the direct result of foreign invasion itself. We may believe that successive Teutonic inroads had so weakened the Roman power in Britain that it was felt hopeless to attempt to keep the province any longer. But the actual Teutonic conquerors of the island found the Roman legions already gone. Britain was won by the English, not from Roman legions or from Roman provincials, but from men who had been Roman provincials, but who, on the withdrawal of the Roman legions, had changed into an independent British people. It is, however, to be borne in mind that the independence in possession of which the Britons were found by their English conquerors was an independence which had been thrust upon them. No province of the empire separated itself from the empire of its own free will. Britain would have had, on every geographical and national ground, more temptation so to do than any other province of the West. But Britain did not, any more than any other province of the West, seek for independence of Rome. The forsaken people, left to themselves, cried to their masters to come back

Britain left independent.

to be their helpers; but the groans of the Britons fell in vain on the ears of Aëtius. He could deliver Gaul from the Hun; he felt no call to deliver Britain from the Pict or the Saxon. The inhabitants of the Roman province of Britain were left to defend themselves how they could, against the incursions alike of their neighbors in those parts of their island which Rome had never subdued, and of the more dangerous Teutonic invaders from beyond the sea. Thus forsaken by Rome, they seem to have tried to keep up some shadow of a Roman dominion among themselves. Their chiefs bore Roman titles; a tradition of imperial succession was kept up among the reputed descendants of the tyrant Maximus. So the first British prince whom history or legend brings into personal contact with the Teutonic invaders appears in the earliest versions of the tale, not as a British king, but as a Roman duke. Such is the title which Vortigern bears in that one meagre yet authentic narrative of English conquest which we have from the hand of British Gildas. But, however they might cling to Roman shadows, the people whom the English found in this island were undoubtedly in every practical sense a British nation, a revived British nation. And the fact that the invaders had to deal with a nation, and not with mere provincials, had beyond all doubt a most important effect on the progress and the nature of their conquest.

Contrast with other provinces of the empire.

The land then in which the English conquerors settled, and the people whom they found in possession of that land, were thus in a wholly different condition from the lands in which the other Teutonic conquerors settled, and from the people whom they found in those lands. Here was one cause which gave the English conquest of Britain a wholly different character from the Teutonic conquest of any other of the western provinces of the empire. The difference may in truth be summed up in a word; it was not a conquest of one of the provinces of the empire, but a conquest of a land which had once been a province of the empire. And if the condition of the land and people that were to be conquered was thus unlike that of any land and people elsewhere, the condition of those who were to be its conquerors was at least as widely different from the condition of those who were the conquerors of any of the continental provinces. A large part of the difference lies in the difference between a continental and an insular land. When an island is conquered by new settlers, it can only be by settlers from beyond sea, and a settlement from beyond sea is likely to be in many things different from a settlement which is made by land. This is part of the difference, but it is far from all. Had the invaders of Britain been exactly the same kind of people as the invaders of Gaul or Spain, had the people of Britain been in exactly the same position as the people of Gaul or Spain, the mere fact that it was made by sea would doubtless have given the conquest of Britain a special character of its own. But the main difference lies deeper. As the people of Britain were in a widely different position from the people of Gaul and Spain, so the Teutonic conquerors of Britain were in a position at least as different from the Teutonic conquerors of Gaul or Spain.

Northern Britain never conquered by Rome.

The Picts and Scots.

The enemies by whom the inhabitants of the forsaken province were first attacked were indeed neither men of another race nor invaders from beyond sea. The immediate danger was from the Celtic inhabitants of those parts of the island which the Romans had never subdued. The boundary of the Roman province had often fluctuated, and the defence of the frontier had needed all the efforts of the legions and the further protection of artificial bulwarks. A line of forts, a massive dyke, a wall of stone strengthened by towers, had been raised at different times at two different points. The line of Hadrian marked the southern limit from Solway to the mouth of the Tyne. The line of Antoninus took in a larger territory as far as the firths of Clyde and Forth. Severus fell back to the line of Hadrian. Under Valentinian the victories of the elder Theodosius carried the recovered Roman land of Valentia beyond the line of Antoninus. In the last moments of Roman dominion the boundary again fell back; the defences of Hadrian and Severus were again strengthened, and took the form of that mighty wall on the ruins of which we still gaze with wonder. But amid all these changes there remained to the north of the Roman province an independent territory, of greater or less extent, which the Roman confessed by his very defences that he was unable to subdue. That its inhabitants, like the inhabitants of the conquered part of the island, belonged to the Celtic race there can be no reasonable doubt; but as to the exact degree of their kindred with the people of southern Britain many questions have been raised. On the whole it seems most likely that they belonged to the same branch of the Celtic race as the southern Britons, and that they differed from them chiefly as the unsubdued part of any race naturally differs from the part which is brought into subjection. In the later days of the Roman power in Britain, these northern tribes, under the name of Picts, appear as dangerous invaders of the Roman province, invaders whose inroads were sometimes pushed even into its southern regions. Along with them we hear of the Scots, a name which as yet means only the people of Ireland. But about this time the Scottish name was carried into Britain by a settlement of Irish Scots on the north-western coast of the island, in the land known as Argyle. The Picts of Britain, the Scots of Ireland, appear as the first enemies whose attacks had to be endured by the forsaken inhabitants of the former Roman province. But it was not the Picts or the Scots by whom the conquest of southern Britain was to be made. A conquest at their hands could have had no other effect than bringing the island back more or less thoroughly into the state in which it had been before the Roman Conquest. Another fate was in store for the greatest of European islands. The conquest of southern Britain was to be made, but it was not to be made by any of the inhabitants of Britain. That great event, one of the greatest in the history of Europe and of the world, was to be the work of Teutonic settlers from beyond the sea.

General character of the Teutonic settlements in the empire.

The Teutonic settlement in Britain must, in the general history of Europe, be looked on as part of the great movement which drove so many of the Teutonic nations westward and southward. It was part, in short, of the general wandering of the nations. But it had in many respects a character of its own, which distinguishes it in a marked way from the other western and southern settlements of the Teutonic conquerors. We have already seen that the condition of Britain and its inhabitants in the fifth century was widely different from the condition of Gaul or Spain. The land had never been so thoroughly Romanized, and the Roman legions had been withdrawn by a voluntary act of the Roman government. Here we have one point of difference; we have also seen that there is another point of difference in the mere fact that the invaders came by sea. But the difference in the position and character of the invaders themselves was more important still. The great mass of the Teutonic settlers who entered the empire by land had already acquired some tinge of Roman cultivation. They already knew something of the arts, the laws, and the religion of Rome; they served in the Roman armies; they received grants of land within the Roman dominions as the reward of their services. Their princes were proud to bear Roman titles of honor, military or civil. The conquest was in many cases veiled under some form of decent submission to the Roman power. The Teutonic chief, in truth a foreign invader, did not scorn to give his occupation a show of legality by accepting some kind of commission from the emperor. In short, in most of their continental conquests, the Teutons were to the Romans, if conquerors, yet also disciples. In most cases they had embraced Christianity before their final settlement on Roman ground. Where this was not the case, their conversion speedily followed on their settlement.[1] Where they came as Christians, but as Arian Christians, they gradually conformed to the Roman standard of orthodoxy. Sooner or later they exchanged their own speech for the speech of Rome, and were gradually lost among the mass of the Roman inhabitants. These processes were quicker or slower according to circumstances. They were quicker where the Goths in Spain or the Burgundians in Gaul were altogether isolated and cut off from their old homes. They were slower where, as in the case of the Franks, the settlements of the conquerors on Roman ground were continuous with their former possessions in the unconquered Teutonic land. But sooner or later, more or less completely, the same causes led to the same results. Wherever the Teutons settled within the empire, they neither exterminated nor assimilated the Roman inhabitants. They were in the end assimilated by them, though, of course, in the process of such assimilation, the Roman inhabitants themselves underwent a certain degree of modification, greater or less according to circumstances. Thus both France and Italy are Roman lands, with a certain infused Teutonic element. But for the same reasons which made assimilation in Gaul slower than in Italy, the infused Teutonic element is much greater in France than it is in Italy.

---

[1] The Vandals and the East-Goths came to an end at a comparatively early stage of their settlement, before they had assimilated with the Romans. The more permanent settlers, the West-Goths in Spain and the Lombards in Italy, gradually became Catholic.

Different character of the Teutonic conquest of Britain.

The case of the Teutonic tribes which settled in Britain was altogether different. They came from lands which had been altogether untouched by the Roman power, and where the arts, the language, and the religion of Rome were altogether unknown. They had never been Roman subjects, Roman soldiers, or even Roman allies. They had received no grants from Roman princes, nor had their chiefs been honored with Roman titles. They were, in short, altogether free from Roman influences. They had no share in that reverence for Rome and all that belonged to her that had so deep an effect on all who came within the range of her magic power. They came not, like the conquerors of the continental provinces, as disciples of a civilization which they revered, but simply as destroyers of a civilization of which they knew nothing. The conquerors of the continental provinces, themselves already half Romanized, settled in lands which were still thoroughly Roman. The conquerors of Britain, themselves untouched by the slightest Roman influence, settled in a land where Roman influences had already begun to die out. From this wide difference in the circumstances both of conquerors and the conquered, as compared with the circumstances of conqueror and conquered in other countries, it followed that the English conquest of Britain had a character altogether different from the Teutonic conquest of any other Roman province. A people wholly ignorant of Roman culture, coming by sea, and therefore utterly cut off from their own homes, were of themselves disposed to act as destroyers in a way in which the Teutonic invaders elsewhere were not. They were also, as it were, compelled to act as destroyers by the circumstances of the land into which they entered. They met with an amount of resistance, of steady national resistance, such as Goths, Franks, and Burgundians nowhere met with. They had to win the land bit by bit by hard fighting; their advance was often checked by victories on the part of the Britons, or delayed by periods of mere exhaustion and inaction. Their conquest thus took a character of extermination, of complete displacement of one people by another, which was not taken by the Teutonic conquests elsewhere. The English could not, like their fellows on the continent, sit quietly down as the ruling order among a people who for the most part easily submitted, and who therefore kept their lives, their laws, their religion, and a share of their property. The determined resistance of the Britons made it a struggle for life and death on both sides. On the one hand, it made death or personal slavery the only alternatives for the conquered within the conquered territory. On the other hand, the gradual nature of the conquest gave the conquered in one district every opportunity of escaping into the districts which were still unconquered. There can be no reasonable doubt that the English conquest, in those parts of Britain which were conquered while the English still remained heathens, came as near to a conquest of extermination, to a general killing or driving out of the earlier inhabitants, as was possible in the nature of the case. A complete physical extermination, the killing or driving out of every individual of a whole people, is a thing which cannot take place, except in the case of some utterly helpless tribe attacked by a people immeasurably superior to them in physical resources. Even in such cases it commonly happens that the savage is not, strictly speaking, exterminated by the civilized man; he rather dies out before him. Still less could complete physical extinction take place with a people in the condition of the Britons at the English landing. In the course of the English conquest we may be sure that the alternative of death or flight was the ordinary rule; but we may be equally sure that the rule had its exceptions. The women could be largely spared; even men would sometimes be allowed to escape death at the price of slavery. It might even happen that here and there some of the conquered might make terms with the conquerors, and might be admitted to their fellowship. In all these ways it follows that, physically and genealogically, there is a British element in the English nation, even in the most strictly Teutonic parts of England. No nation is of perfectly pure blood, and the English nation is no exception to the rule. The point is that the British infusion was not large enough to have any perceptible effect on the national being of England. The smaller Celtic infusion was assimilated into the greater Teutonic mass. In the sense of the physiologist or the genealogist, the English nation is not purely Teutonic; but then in their sense no nation is purely anything. The point is that the English people are as strictly Teutonic as the High-Germans are Teutonic, or as the Britons themselves were Celtic. This or that Englishman may conceivably have had British forefathers, as this or that High-German may conceivably have had Slavonic forefathers, as this or that Briton may conceivably have had Basque forefathers; but to speak of the Britons as the forefathers of the English nation as a nation is as misleading as it would be to speak of the Slaves as the forefathers of the German nation, or of the Basques as the forefathers of the British nation. One nation displaced another; the English displaced the Britons. One system of law, language, and religion gave way to another system of law, language, and religion. The English swept away all that was Roman or British from the soil of the land which they made English, as thoroughly as the Saracens swept away all that was Roman from the soil of Africa. Yet we may be quite certain that in both cases some slaves and renegades here and there conformed to the new state of things. The only point is that they were not in such numbers as to be of the slightest historical importance, not in such numbers as to work any practical modification of the general mass in which they lost themselves.

Exterminating character of the conquest.

The English displace the Britons.

A new people thus settled in the land, a people who displaced, as far as their complete conquest reached, its earlier inhabitants. From each successive district that was subdued all traces of the old state of things passed away, except a few of the gigantic works of Roman engineering skill. The old language passed away; English displaced Welsh as the language of every district which the English occupied. And the language of the conquerors, in thus displacing the language of the conquered, was hardly at all modified by it; a few Welsh and a very few Latin words were all that crept into English at this stage. The old local nomenclature passed away, except in the case of a few great cities and a few great natural objects. London on the Thames and Gloucester on the Severn keep their British names; but the names of the vast mass of the towns and villages of England are purely English. The only exceptions are in the districts which were won from the Briton at a later stage of conquest, and in those districts which, through the working of later events, came largely to exchange their English nomenclature for a Danish one. But the English and the Danish nomenclature mark two successive waves of Teutonic conquest; they make one whole as opposed to anything Roman or British. The change of nomenclature shows how complete the change of occupants was; the land was settled and divided afresh, and each place received a new name in the language of the new settlers. The settlers brought with them their own territorial and tribal divisions, their own laws or customs, their own religion. No feature of primitive English law or custom can be shown with the slightest probability to be derived from a Roman or British source. And nowhere, at this stage, within the conquered districts did conquerors and conquered live on side by side, each making use of its own law, as so largely happened in the Teutonic conquests on the continent. That English territorial divisions often represent the earlier divisions of the conquered people is far more likely. The territory won by a particular battle would naturally answer to the territory of the tribe which was overthrown in that battle. And where earlier divisions were made convenient by anything in the physical conformation of the country, the same reason which had already fixed the boundary would lead the new settlers to fix it again at the same points as before. But everything else passed away. Kent alone, of the great divisions of south-eastern Britain, kept its name through all conquests. But it passed on its name to a new race of

The English conquest a heathen conquest.

Kentishmen, *Cantwaru*, alien in blood, speech, law, and faith to the British *Cantii* whom they displaced. That the new-comers were alien in faith is perhaps after all the greatest and most important point of difference between the English conquest and the other Teutonic conquests. Of all the Teutonic conquerors of lands which were or had been Roman, the English alone entered the land as heathens and abode in it as heathens. The religious history of Roman Britain is a most mysterious subject; but there can be no doubt that there was an organized Christian church in the island at the time of the English invasion. And, as far as we can see, it would seem that, at least within the former Roman province, the profession of Christianity was universal; there is no sign that aught of old British or Roman idolatry still lived on. On this Christian land and this Christian people came the destroying scourge of a heathen conquest. Our one record of the time, the lament of Gildas, brings out this feature in the strongest light. As afterwards, when the Christian English came under the scourge of the heathen Dane, so now, when the Christian Briton came under the scourge of the heathen English, the churches and clergy were the foremost objects of the destroying fury of the invaders. During the first hundred and fifty years of English settlement in Britain, English conquest meant heathen conquest; English rule meant heathen rule. Christianity, its ministers, its professors, its temples, were thoroughly swept away before the inroad of Teutonic heathendom.

Comparison with the Rhenish and Danubian lands.

In all these ways then the English conquest of Britian stands apart by itself, as something differing in all its main features from the common race of the Teutonic conquests elsewhere. There are only two parts of Western Europe which present phænomena which are at all like those of our own island. These are those parts of Germany which lie on the left bank of the Rhine and on the right bank of the Danube. There, as in Britain, a land that was Roman ceased to be Roman. The speech, the laws, and the manners of Germany displaced those of Rome. Thus far the case of these lands resembles the case of Britain, and is unlike the case of Italy, Spain, and the rest of Gaul. But their case differed in this, that the Rhenish and Danubian lands lay adjoining to the unconquered Teutonic lands; they were the lands which were specially exposed to Teutonic inroads. The earliest inroads of the invaders would naturally be of a more devastating kind than those which followed. It would largely be in the course of their earliest inroads that they picked up that amount of Roman culture which made the second stage of their inroads less devastating. And after all, the amount of havoc could not have been equal to the amount of havoc which was done in Britain, as most of the Roman cities lived through the storm and kept their Roman names. And in the lands west of the Rhine, in those German lands which formed part of the Roman province of Gaul, the Teutonic invaders were but winning back an old Teutonic land. It is possible that some traces of Teutonic speech and feeling may have still lingered on to make the progress of the invaders more easy. And in these lands, above all, the Roman inhabitants had the fullest means of withdrawing into the unsubdued part of the province. As long as the Teuton was a mere destroyer, they would naturally seek shelter in the lands which were still untouched. As soon as he became only a conqueror, and not a mere destroyer, they would find it more to their interest to submit. In Britain it was not till a much later stage, not till the greater part of his conquests were made, that the Teutonic conqueror began to carry on his conquests in such a fashion as to make it the interest of the conquered to submit rather than to flee.

Such then was the general nature of the Teutonic conquest of the greater part of Britain, the conquest which changed so great a part of Britain into England. It was a destroying conquest which swept away the former inhabitants and their whole political system. It was specially a heathen conquest, which utterly rooted up Christianity from a land where it must have already taken deep root. It was a gradual conquest, spread over several centuries, a conquest in which the conquerors had to win each step by hard fighting against the earlier inhabitants. Lastly, it was a conquest which never was completed, which never spread over the whole island. Leaving for the present purely political questions about homage and supremacy, it is plain that there is a large part of Britain which remained untouched by the English occupation, and where the ancient inhabitants, their language, laws, and manners still lived on. And it may be added that, in some districts to which English occupation did extend, in those conquests, namely, which were the latest in date, the character of the conquest greatly changed from what it had been in its earlier stages.

The Low-Dutch tribes and their language.

It seemed well fully to set forth the nature of the conquest before giving any detailed account of the former condition of the conquerors, or any direct narrative of their conquest. Having cleared the ground from misconceptions, it will be easier to tell the tale simply and clearly. The Teutonic conquerors of Britain then were the Low-Dutch[1] tribes from the border-lands of Germany and Scandinavia, the lands from the mouths of the Elbe and the Weser. Their dialects form a branch of the Teutonic speech distinct from the High-Dutch dialects spoken to the south of them. Their own speech must not be looked on as in any sense a corruption of the High-Dutch, but as a perfectly independent and co-equal branch of the great Teutonic family, as old as the High-Dutch, perhaps older. These dialects, which in their system of letter-changes agree with the ancient Gothic and the Scandinavian rather than with the High-Dutch, form the natural speech of the whole coast region stretching from Picardy to Denmark, and they have been carried by conquest far to the east, along the Slavonic, Prussian, and Finnish coasts of the Baltic. But their area has been encroached on in different parts by French, by Danish, and by High-Dutch, so that that form of the Low-Dutch which is spoken in the kingdom of the Netherlands, and which we now know specially as *Dutch*, is the only continental dialect of the whole group which is commonly acknowledged as a national and literary language. Among the tribes of this region, three stand out conspicuously in the history of that conquest, the Angles, the Saxons, and the Jutes.[2] Each had its special and marked share in the work. The Jutes, in all likelihood, formed the first permanent Teutonic settlement in Britain. The Saxons and the Angles settled later; but each of them occupied a far larger part of the island than the Jutes. And each of these last gave a name to the Teutonic settlements as a whole. As soon as the Teutonic settlers were so far united as to bear a common name, the received name on their own lips was *English;* on the lips of their Celtic neighbors and enemies the received name was *Saxon.*

Angles, Saxons, and Jutes.

Native and foreign names of the united nation.

The reason for this difference in nomenclature is plain. The Angles occupied a greater share of the land than the Saxons; they therefore gave the national name to the united people.[3] But the Saxons were the first among the invaders with whom the Celtic or Roman inhabitants of Britain had to deal; they therefore gave the Saxon name to the invaders in general. This last fact at once brings us to the actual history of the English conquest. If we cannot say that the English conquest itself began, we may at least say that the first steps towards it were taken, as soon as any Low-Dutch invaders from beyond sea first attempted a settlement by arms in Roman, or once Roman, Britain. This process, it must be marked, stands wholly apart from questions either as to the possible Teutonic origin of any of the tribes whom the Romans found in Britain, or as to possible Teutonic settlements in the province made with the sanction of the Roman authorities. This last process undoubtedly happened in the case of soldiers of Teutonic race serving in the Roman armies. But Teutonic settlements, either before the Roman occupation or under the Roman occupation, are something wholly distinct from the Teutonic conquest either of a Roman province or of a land forsaken by Rome. Such settlements might make the Teutonic conquest more easy when it did come, but that is all that they could do. Settlers of either of those classes became Roman subjects, Roman provincials. The events which led to the Conquest began when men of Teutonic race first settled or tried to settle in the island, not as Roman soldiers, or Roman subjects, but as foreign invaders of the Roman land. This work, which was not the English conquest, but which was the first step towards it, the conquest which was merely attempted and not carried out, seems to have begun in the second half of the fourth century. Claudian bears witness to the naval victories of the elder Theodosius, the father of the renowned emperor of that name, who (367 A.D.) beat back a Saxon invasion by sea. That is to say, an attempt at Teutonic settlement was then made; but there was still strength in the Roman power to hinder it. Had it been otherwise, the history of English conquest in Britain would have begun in the fourth century instead of in the fifth. Incursions undoubtedly went on; the south-eastern coast of Britain, the part specially exposed to Saxon invasion, got the name of the *Saxon Shore*,[1] and a Roman officer with the title of Count had that shore under his special keeping. But things took quite a new turn after the withdrawal of the Roman legions from Britain. The land now lay open to settlement in a way in which it had not done before. It is now therefore that actual conquests, as distinguished from mere incursions and attempted settlements, begin.

---

[1] *Dutch* is the English form of *Theotiscus*, the truer Latin name of the German nation, of which *Deutsch* in its various spellings is the native form. This wider use of the word has hardly ceased in America, and in England the name, with its two divisions of *High-Dutch* and *Low-Dutch*, was in familiar use down to the beginning of the last century.

[2] The Angles and the Saxons are plain enough; there is a certain degree of mystery about the Jutes, their name, and their origin. But it is enough for our purpose that they were a third Teutonic people, distinguishable from the Angles and Saxons.

[3] *Engle*, *Angelcyn*, *Angli*, are the usual names of the united nation. *Angli-Saxones*, *Angul-Seaxe*, are sometimes found, especially in the royal style of the tenth century. Those forms are equivalent to *Angli et Saxones*, the nation formed by the union of the Angles and Saxons. It is therefore the more correct description of the two; but its employment in England is always formal; it clearly never passed into general use. In foreign writers it is somewhat more common.

First attempts at settlement.

The Saxon Shore.

Notices of the conquest.

Our materials for the history of this great event, an event which is nothing short of the beginning of our national history, at first sight seem scanty. Our only absolutely contemporary notice is to be found in two meagre entries in the chronicle of Prosper of Aquitaine, which however assert the main fact that Britain was brought under the power of the Saxons about the middle of the fifth century.[2] The native writer who is most nearly contemporary, the Briton Gildas, belongs to the next century, and was a witness of some stages, though not of the earliest, of the work of conquest. He is the earliest writer who gives us anything that can be called a narrative, a narrative meagre enough, but which helps us to some particular events and personal names. About the same time Procopius, without any direct notice of the conquest, speaks of Britain as a land inhabited by Angles and Frisians as well as Britons. The series of English writers begins with Bæda, and goes on with the English Chronicles, to which we may fairly add the fragments of ancient English songs which lurk in the Latin of Henry of Huntingdon. Of these Bæda himself did not write till more than two hundred years after the beginning of the Conquest, and the materials for his short narrative of the Conquest itself seem to come at least as much from British as from English sources. Our only details are those which are preserved in the Chronicles and in Henry of Huntingdon. The Chronicles in their present form do not date from an earlier time than the reign of Ælfred in the ninth century; but any one who studies them carefully will see that this part of the record contains far older materials. The narrative is remarkably free from anything which has a legendary sound. That its chronology may be largely arbitrary is possible; but that it is so is of itself an arbitrary conjecture. The English at the time of their landing were not wholly illiterate. They had their runic alphabet, and it is perfectly possible that the entries in the Chronicles may come from an absolutely contemporary record. Such a record, even if it marked the sequence of years according to some reckoning of its own, must of course have been adapted to the Christian reckoning by the compilers of the Chronicles, and in such a process some errors of detail may well have crept in. But there seems no reason to suspect invention, falsification, or even accidental error, on any great scale. The narrative will bear testing; the entries fit in with all that can be made out from an examination of the country. They fit in with the notices of the Welsh writers, and with all such incidental sources of knowledge as we have. In this way a narrative in considerable detail has been recovered by the care and skill of Dr. Guest. As for the notices in Henry of Huntingdon, which evidently contain fragments of lost poems, we must remember that a contemporary poem may be just as good an authority as a prose writing. Several poems are inserted in the Chronicles themselves in undoubtedly historical times, in the tenth and eleventh centuries. Other poems of those ages, sometimes, like the song of Maldon, preserved in the original, sometimes, like the song of Stamfordbridge and the song of Waltheof at York, preserved only in Latin fragments, are among our best materials for military events. They go far more into detail than the prose writers do. There seems then no good ground for doubting the general trustworthiness of the narrative which is preserved to us in the Chronicles, and which we are occasionally able to enlarge from other sources. It is, of course, only the earlier stages of the Conquest that can be made the subject of any controversy at all. From the beginning of the conversion of the English to Christianity, we begin to have contemporary materials of one kind or another, till, in the time of Ælfred, the Chronicle itself becomes contemporary. It is only for about a hundred and fifty years that we are left almost wholly to judge of our materials by their internal evidence. And surely a narrative like that of the Chronicles, no tissue of wild and impossible legends, but a steady business-like series of entries, may very well have been handed down for that length of time by means of runes, helped here and there by a contemporary song.

Settlement of the Jutes in Kent.

Our narrative then, put together from these various sources, represents the Britons, after the departure of the Roman legions, as left without defence against the attacks of their northern neighbors the Picts and Scots. They apply for help to Aëtius; but the Roman general, busy in the struggle with Attila, has no leisure to do anything for them. Their prince, who bears a name of which the most familiar form is Vortigern, invites the help of the Saxons, an unwise step enough, but one which has plenty of parallels in history. The British prince, in the most authentic record, is not a king but a duke. The Teutonic leaders whom he invites are also *ealdormen* or *heretogan*, not kings. They are the two brothers Hengest and Horsa. Their landing is fixed by the Chronicle to the year 449; and, without insisting on this exact date, it is plain that the Conquest must have begun about the middle of the fifth century. A warfare of nearly forty years, in which many battles are entered, established the first Teutonic kingdom in Britain, that of Kent, the one land which never lost its British name. Of the two brother leaders, Horsa is killed in a battle with Vortigern in 455, after which Hengest and his son Æsc assume the kingly title. In all this there is nothing like romance; it is a matter-of-fact kind of history, which might be preserved by a runic chronicle, which might almost be preserved by tradition. Once only we have a touch which seems to come from a song, as when in a battle in the year 473 the Welsh are said to have "fled from the English like fire." The geography of the story has been minutely examined, and it shows that the tale is a sound and credible military narrative. Later writers, English and British, have tricked out the story with endless mythical details, and have carried the arms of Hengest far beyond the narrow limits of Kent, to which the Chronicle confines them. Modern critics have found materials for cavil in the names of the two brothers, and in the number of the thirty-nine years of the reign of Hengest. Both points might easily be given up. The main fact is the gradual conquest of a small corner of Britain after much hard fighting with its British possessors. But there really seems no reason why Hengest and Horsa might not be names of real men as much as Wulf, Beorn, and Leo. And the years of Hengest's reign are, after all, one short of the mystical forty.

Use of the *Saxon* and *English* names.

In the British narrative, in the single Roman entry, of these events, the Teutonic invaders are called *Saxons*. In the Chronicles they appear as *Angelcyn*, *Angle*, *Engle*, Angles or English. They are so called, not merely in the historical summary of the ninth century editor, but in the entry (473) which has the earliest ring of all about it. But when Bæda, and after him the Chronicler, give a short ethnological account of the invaders, they describe the Teutonic conquerors of Kent neither as Saxons nor as Angles, but as Jutes. As the Jutes then, in the very record of their conquest, are spoken of, on the one hand as Saxons, on the other hand as English, it seems to follow that, from the very beginning, the Celtic inhabitants of Britain called all Teutonic invaders Saxons, while the invaders themselves from the very beginning used Angle or English as their common name. The general use of the Saxon name by the Celts is only what we should have looked for; the wide use of the English name among the Teutons themselves is a fact to be noticed. It is at least certain that, while the English name is often applied to Saxons and Jutes, it would be hard to find any case where an Angle calls himself, or is called in his own tongue, a Saxon. We need not infer that the English name had become the common name of all the three tribes before they left Germany; it certainly became so within no long time after they settled in Britain.

---

[1] The *Limes Saxonicus* or *Littus Saxonicum* was first truly explained by Dr. Guest. It means, not a shore occupied by Saxons, but a boundary against Saxons. It answers to the Danish, Slavonic, and Spanish marches of the later empire, except that in the one case the enemy was to be dreaded by land, and in the other case by sea.

[2] Prosper has two entries. The former says that "Hac tempestate (the time of Constantine the Tyrant, 407–411), præ valitudine Romanorum, vires funditus attenuatæ Britanniæ." The other says that, some time before the death of Aëtius in 454, "Britanniæ, usque ad hoc tempus variis cladibus eventibusque laceratæ, in ditionem Saxonum rediguntur."

The *Welsh* name.

We also see that, from the beginning, the Teutonic conquerors spoke of their British enemies as *Welsh* or strangers. The name is familiar in that sense both in Britain and on the mainland, but it seems never to be applied to any strangers but those who were either of Roman or of Celtic speech. And it would seem to be applied only to those Celts who had come under the Roman dominion. Our forefathers spoke of the *Bretwealas* in Britain, of the *Galwealas* in Gaul, of the *Rumwealas* in Italy; but the name seems never to be applied to the Scots either in Ireland or in Britain. Like the word *Slave*, it sank, in the language of the conquerors, to express bondage. The masculine *wealh* sometimes, the feminine *wylne* much more commonly, mean a slave in the secondary meaning of that word. This difference of usage is again remarkable. It falls in with the belief, natural in itself, that in the process of conquest the few Britons who were spared were mainly women. Again, Bæda and the Chronicler, as we have seen, speak of the Teutonic conquerors of Britain as sprung from three tribes only, the Saxons, Angles, and Jutes. It was plainly only those three tribes, that is, chiefs of those tribes, who founded kingdoms in Britain.

Question of other Teutonic tribes.

But in all great migrations various kindred tribes are sure to take a part, and it would be rash to rule that no Low-Dutch people but those three took a part in the enterprise. Procopius, for instance, speaks, not of Angles and Saxons, but of Angles and Frisians. We may well believe that Frisians, and other tribes too, helped in the work. Possibly no one settlement consisted wholly of men of any one tribe. It is enough that all the royal races of the several kingdoms belonged to the three stocks, Saxon, Anglian, and Jutish. It was then by Saxon, Anglian, and Jutish settlers, or at all events by settlers under Saxon, Anglian, and Jutish leaders, that the greater part of Britain was changed into England. But the work was a slow one, and the way in which it was carried out seems not to have been exactly the same in all parts.

Growth of seven or eight chief kingdoms.

In the end seven or eight chief kingdoms were founded. The old dream of a regular *Heptarchy* has long been exploded; but it is certain that, among a crowd of smaller states, seven or eight stand out as conspicuous among the rest, and as having something like a continuous history.

The Jutish settlements.

The Jutes, the first to settle, occupied the smallest part of the country. Their dominions took in only Kent with perhaps for a while Surrey, and Wight with a small part of the neighboring mainland of Hampshire. They were hemmed in on all sides by the Saxon settlements, all of which bore the Saxon name.

The Saxon settlements.

Suthsexe, *Westsexe*, *Eastsexe*, have been softened in modern speech into Sussex, Wessex, and Essex; but the names are strictly not territorial, but tribal. *Westsexe* and the rest are all of them names, not of a land, but of a people. The whole of the Saxon settlements were made on the southern and south-eastern coasts; and it was the West-Saxons only who at any time carried their conquests to any distance inland.

South-Saxons.

The South-Saxon settlement came next after the Jutish settlement in Kent. The date given to it is 477. The most remarkable event in the process of conquest was the storming of Anderida, now Pevensey, in 491. The forsaken walls of the Roman city still bear witness to the day when Ælle and Cissa slew all that were within, and when not a Bret was left behind. But the South-Saxons found a natural frontier to the north in the great wood of Anderida. Their kingdom always remained little more than a long strip of coast, cut off to a great extent from the other kingdoms of Britain, and playing but a small part in their general history. It still keeps its name and boundary as the modern county of Sussex.

West-Saxons.

The kingdom of the Gewissas or West-Saxons, founded to the west of the South-Saxons, was destined to hold quite another place in English and British history. Two Saxon *ealdormen*, Cerdic and Cynric, founded in 495 a settlement on the coast of what is now Hampshire. That settlement grew into the kingdom of England. Twenty-four years after their first landing, the two Saxon ealdormen deemed their position strong enough, and their conquests wide enough, for them to assume the kingly title. Thus began the royal line of the West-Saxons, which became the royal line of England.

East-Saxons.

The third Saxon settlement, that of the East-Saxons, has no such definite date given to its foundation; but it certainly began not later than the first half of the sixth century. Like Sussex, it never extended itself far inland; but it derived some importance from its containing two of the great cities of Roman Britain. One was Camulodunum or Colchester; the other was London. But London, with its district of the Middle-Saxons, grew, by virtue of its admirable position, to a greatness which gave it a separate being. The city of ships, on its broad river, remained as a great prize to be striven for by every conqueror, rather than as a lasting and integral possession of any one of the English kingdoms.

The Anglian settlements.

The settlements of the Angles, who in course of time occupied a much larger part of the land to which they gave their name than was occupied by the Saxons, have quite another history from the kingdoms of which we have just spoken. In Kent, in Sussex, in Wessex, the chief who leads the settlement is himself the founder of the kingdom. In the case of Kent and Sussex the kingdom never permanently outgrew the bounds of the earliest conquests. The boundaries of Wessex advanced and fell back and advanced again; but they advanced by the process of bringing fresh conquests, newly won from the Briton, under the rule of the already existing kingly house of Wessex. The Anglian kingdoms grew in another way. We know, in some cases at least, the names of their first kings; but those first kings do not appear as the first leaders of settlers from beyond sea. It would rather seem as if a crowd of small settlements, of the date and circumstances of whose foundation we can say nothing, each doubtless ruled by its own ealdorman or petty king, were gradually grouped together into several considerable kingdoms. It is perfectly possible, though there is no evidence for the belief, that some of these original settlements may have actually been of earlier date than the landing of Cerdic, of Ælle, or of Hengest. What is certain is that these Anglian states do not appear as organized kingdoms till a later time than Kent, Sussex, and Wessex. The chief Anglian powers were four.

East-Angles.

The East-Angles occupied the land to the north of the East-Saxons, a land which the vast fen region to the west of it made in those times, if not insular, at least peninsular.

Bernicia.

North of the Humber arose two kingdoms, Bernicia and Deira, whose union at a later time formed the mighty realm of Northumberland, stretching from the Humber to the Forth. Ida, who in 547 gathered together a number of scattered Anglian settlements into the kingdom of Bernicia, is the one Anglian prince during the first stage of conquest who stands out with a personal being like that of the Saxon and Jutish founders. From his fortress on the basaltic rock of Bamburgh, overhanging the German Ocean, he ruled the eastern seaboard from Tees to Forth.

Deira.

Of the founder of the kingdom of Deira to the south of Bernicia we have no such clear mention, nor do we know when or by what means that kingdom won the possession which gave it its chief importance. This was the former capital of Roman Britain, *Eboracum*, *Eoforwic*, or York. Of the process of conquest in central England we know even less. We know absolutely nothing of the circumstances under which the land was won from the Briton. A crowd of Anglian tribes, which kept more or less of separate existence till a very late time, were gradually brought under the dominion

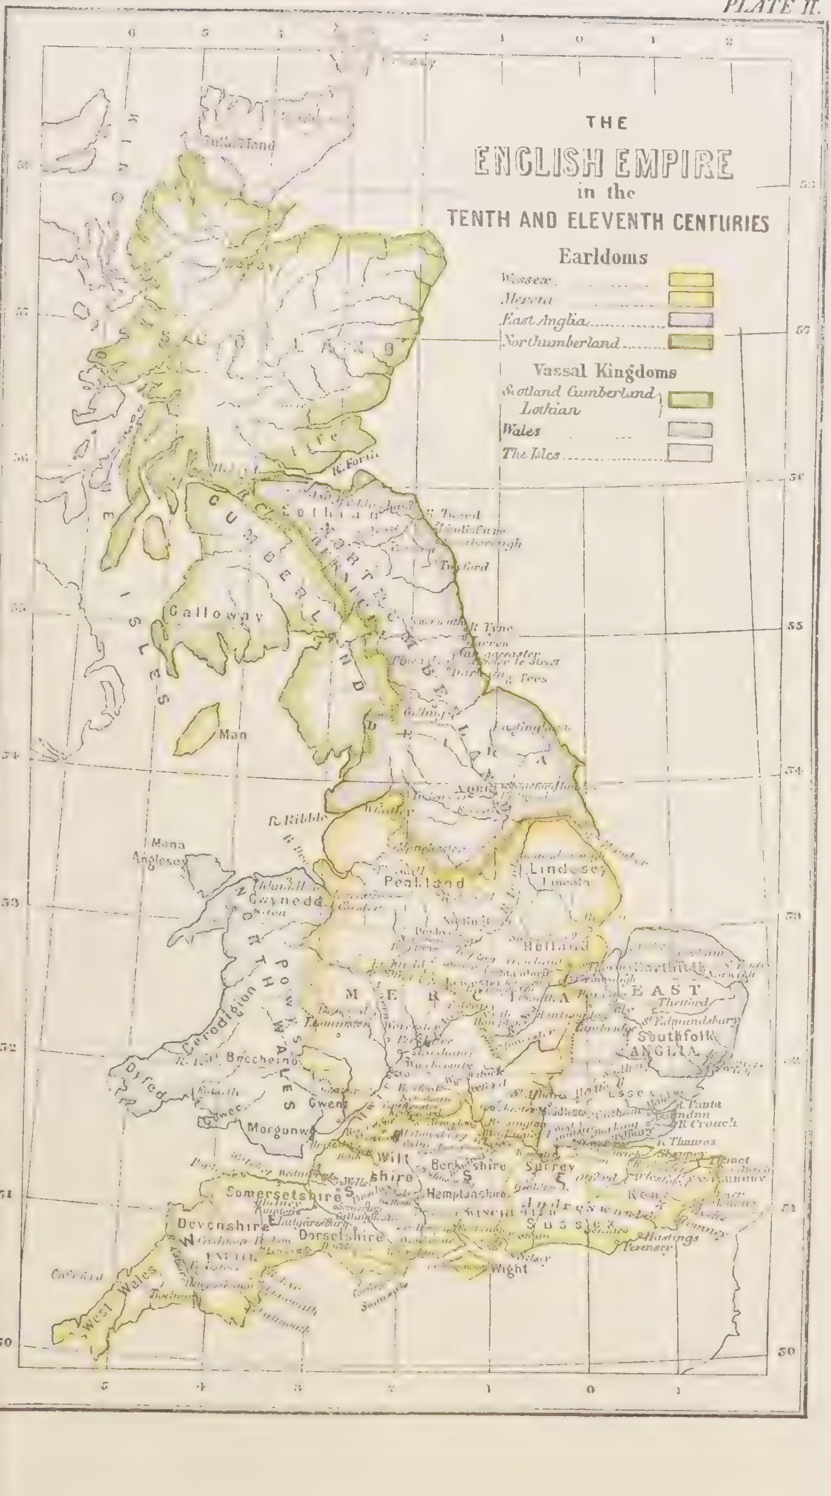
PLATE II.



Growth of *Mercia*.

of a single Anglian power. This power, as growing up on the British frontier, took the name of *Merce*, the men of the mark or border, and the name of *Mercia* gradually spread over all central England. The date of the beginning of the Mercian kingdom is fixed as late as 584. But this of course does not mean a fresh settlement from beyond sea, but simply the gathering together of several small settlements so as to form one considerable power. The boundaries of the true Mercian kingdom may be traced by the boundaries of the old diocese of Lichfield; but it could not have reached to anything like this extent so early as 584.

Final predominance of Wessex.

Here then we have, among a crowd of smaller states, a few kingdoms, seven or eight in number, which stand out prominently, and fill a place in the history of Britain. Among these again, a smaller number stand out at different times as aspiring, with more less of success, to the general supremacy of the country. In all cases where a number of kindred but independent states lie near together, a supremacy of one kind or another is sure to come, either by force or by consent, to some one among the number, in which the rest are, more or less quickly, more or less thoroughly, merged. Thus, in modern Europe, France grew into Gaul, and Castile grew into Spain; thus in our own day Piedmont has grown into Italy, and Prussia has gone far towards growing into Germany. So in the end Wessex grew into England; but it was not till after many struggles, many ups and downs, many changes of frontier, that the house of Cerdic became the royal house over the whole land. Three, or at most four, of the greater Teutonic kingdoms in Britain became serious competitors for the general supremacy over all the settlements of the race. Kent, small in geographical extent, had the start in order of time, and was in many ways favored by position. But any effective supremacy on the part of Kent belongs only to an early stage of English occupation; the powers among which the supremacy was really disputed were the great Saxon kingdom of Wessex, the great Anglian kingdom of Northumberland, formed by the union of Bernicia and Deira, and the Anglian kingdom of Mercia, which formed itself in the space between them.

The *Bretwaldas*.

It would seem that, sometimes at least, a supremacy of some kind on the part of one kingdom over the whole or part of the rest was formally acknowledged; and the chief so recognized by common consent was known as a *Bretwalda* or ruler of Britain.[1] Our knowledge on this subject hardly goes beyond establishing the fact that such a supremacy was sometimes acknowledged, without telling us anything in detail as to its nature, or as to the way in which it was obtained. It was not continuous; there were times when there was no Bretwalda. It fluctuated from kingdom to kingdom, according to the accidents of war, policy, or personal ability. The fact that such a supremacy existed from early times is chiefly important on account of what it afterwards grew into. The tradition of a supremacy vested in some one power clearly helped the West-Saxon kings in gathering all the Teutonic kingdoms of Britain into the one realm of England. It further combined with other influences in suggesting the doctrine of an imperial supremacy over the whole isle of Britain.

Process of conquest.

The establishment of these kingdoms at the expense of the Britons forms the period of heathen conquest, which we may reckon at about a hundred and sixty years.

Plate II. (Britain in 597).

In the course of that time, the English, at first established only on the eastern and part of the southern coast, made their way step by step to the western sea. At the end of this period the whole of Britain was very far from being conquered; indeed English conquest was very far from having reached its fullest extent; but the English had become the dominant race in South Britain. The Britons still kept a large part of the land; but they held it only in detached pieces. The English were the advancing people. The Britons could not at the utmost hope to do more than defend what they still kept. The work of conquest during this period was mainly the work of Wessex at one end and of the Northumbrian kingdoms at the other. Sussex, Kent, East-Anglia, each gave the English race a Bretwalda; but these powers, as well as Essex, were geographically cut off from any share in the conquest after the first stage of settlement. Wessex, on the other hand, whose later growth took another direction, pressed boldly into the heart of Britain. West-Saxon progress was indeed checked for a while by British resistance under the famous Arthur. The legendary renown which has gathered round Arthur's name ought not to wipe out the fact that he met Saxon Cerdic face to face, and by the rings of Badbury dealt him a blow which for a while made the English invader halt.[2] But from the middle of the sixth century West-Saxon advance is swift. In 552 the second stage begins with the taking of Old Sarum. Sixteen years later comes, doubtless not the first, but the first recorded, fight of Englishman against Englishman. The fight of Wibbandún (Wimbledon) made Surrey West-Saxon, and cut off Kent from all hope of further advance. In 571 the West-Saxon border, under the Bretwalda Ceawlin, stretched far beyond the Thames, as far north as the present Buckingham. Still no English conqueror had reached the sea between Britain and Ireland. From Dunbarton to the south coast of Devonshire, the British occupation of the western side of the island was still unbroken. Aquæ Solis, Corinium, Glevum, Uriconium, and, greater than all, Deva on her promontory, were still British strongholds. They had not yet changed into Bath, Cirencester, Gloucester, Wroxeter, and Chester. The next object of the advancing English was to break this line, to reach the sea, and, if not wholly to subdue the British inhabitants of the west coast, at least to break their continuous power into fragments which might be more easily overcome.

Conquests of Ceawlin.

In 577 Ceawlin took Bath, Gloucester, and Cirencester, and carried the West-Saxon border to the estuary of the Severn, the future Bristol Channel. The British dominion was thus split asunder. Wales and Strathclyde, to use the geographical names of a time a little later, still formed a continuous whole. But they were now cut off from all connection with the Britons in the great south-western peninsula, the peninsula of West-Wales, from the northern Axe to the Land's End. To break through the line at another point, to seize Deva and to carry the West-Saxon arms to the north-western sea, was the next object. In this Ceawlin failed; but his expedition of 583 established a long strip of English territory along the Severn valley. Wessex thus seemed to be growing into the great power of central, as well as of southern, Britain. But the second great blow which was to cleave the British dominion into three, as it had been already cloven into two, was not to be dealt by Saxon hands. A great power had now grown up in the north.

Growth of Northumberland.

At various periods before and after the English conquest, things looked as if the supreme power was to be fixed in the northern lands, in the city by the Ouse and not in the city by the Thames. Eboracum had been in Roman days the capital of Britain. The once imperial city was now at the head of a great realm, formed by the union of Bernicia and Deira under their conquering king Æthelfrith. In 603 a victory over the Scottish king Ægdan at Dægsanstan secured his power to the north.

Taking of Deva by Æthelfrith.

Some years later he broke through the line of unconquered British territory; he smote the Britons under the walls of Deva, and left those walls, like the walls of Anderida, desolate without an inhabitant. The English conquest of Britain, if not yet completed, was now assured. The British power, which five and twenty years before had stretched uninterruptedly along the whole west coast, was now broken into three parts. Through western and central Britain the boundaries were still very fluctuating. While Æthelfrith smote Deva, lands near to his own capital, the land of Elmet and Loidis, the modern Leeds, was still unconquered British ground. The dominion of Wessex north of the Thames and Avon had rather the character of an outlying territory stretching into a hostile land, than of the compact dominion which the West-Saxon kings held over Hampshire, Wiltshire, and Berkshire. Moreover the two great powers of the north and the south were now brought into rivalry and collision. Æthelfrith had done what Ceawlin had failed to do; and between Northumberland and Wessex a third great power had arisen, which in a few years was to show itself the equal of either. The West-Saxon had reached the western sea at one point; the Northumbrian had reached it at another point. But the greater part of the western conquests of both were to go to swell the Mercian power which had just come into being. And besides all this, a revolution had begun which was to work the greatest of all changes. The victory of Æthelfrith was the last great blow dealt by the heathen English to the Christian Britons. When it was dealt, Northumberland, Wessex, Mercia, Sussex, and East-Anglia were still heathen. But Kent and Essex had already embraced the gospel. York and Winchester still knew no worship but that of Woden; but the altars of Christ had already risen once more in Canterbury and London.

---

[1] It may be, as Mr. Kemble suggests, that the truer form is *Brytenwealda*, and the truer meaning "wide ruler." But if so, it is true only etymologically. In the two or three places where the name is used, it is used, rightly or wrongly, to mean "ruler of Britain."

[2] Dr. Guest has shown that "Mons Badonicus" is not Bath, or anywhere else but Badbury in Dorset.

Effects of Christianity.

Old-English language.

The time of heathen conquest thus ends with the first years of the seventh century. The introduction of Christianity among the English was so great a change, it gave so different a character to all the events that followed, that this would seem to be the most fitting point in our story to stop and attempt a picture of the general state of things in Teutonic Britain during the first century and a half after Teutonic conquest began. The introduction of a new religion did not stop warfare, whether between Englishman and Briton or between Englishman and Englishman. It did not stop aggressive conquest at the cost of either kinsmen or strangers. But it so far humanized its new converts that warfare ceased to be exterminating. Conquest now meant political subjugation and, for a while, social degradation. It no longer meant the more frightful alternatives of death, flight, or personal slavery. The lands won by the English up to this date must be looked on as having become purely Teutonic. The Britons were swept away as nearly as a people can be swept away. The lands conquered after this time must be looked on as lands in which the dominant Teuton has largely assimilated his Celtic subjects. The process has gone on from that day to this, and it goes on still. Kent, the south-eastern peninsula, has been purely English for fourteen hundred years. Cornwall, the south-western peninsula, has become fully English, even in speech, only within the memory of a generation which has hardly passed away. Thus, in the hundred and fifty-eight years which passed between the landing of Hengest and the victory of Æthelfrith, a large part of Britain had received another language, another religion, another system of law. Old things had passed away; all things had become new. In the whole eastern part of the island, from the Forth to the English Channel, and through a great, though still somewhat undefined, central region, reaching at two points to the western seas, the Roman and the Briton had gone, and the Teuton had taken their place. The three Low-Dutch tribes brought with them their form of the common Teutonic language. Into that language a few Roman and a few British words crept from the beginning. British slaves, British women, brought in a few humble words of domestic life. A few of the great works of Roman civilization, such as the conquerors had never seen in their own land, struck them with awe and wonder. For these they had no names in their own tongue; they therefore kept their Latin names in the English tongue. The words *street, port, chester*, thus came into our language. Many of the great natural objects, most of the rivers, a few of the hills, kept their earlier names; so did a few great cities. With these few exceptions, the vocabulary of the tongue which our fathers brought with them remained untouched. It was enriched by a few new words to express new ideas, and that was all. Nothing happened till far later times to make any change in its character, its grammatical construction, its general stock of words. We brought with us our language, and with our language we brought with us the earliest monuments of its literature. We brought with us our English Iliad in the primæval Song of Beowulf; we brought with us our Homeric catalogue in the Song of the Traveller. Whether they were written or unwritten, whether they lived only in the memory or were graven with the primæval runes, those songs were the work of Englishmen in days before a rood of British soil had become England. Nor need we doubt that the deeds of Hengest and Cerdic had already been graven on the primæval beech,[1] while yet Englishmen knew no speech but English, and worshipped no god but Woden and his fellows. Before the Roman made his second appearance in this island, the national literature of Englishmen, the local literature of England, had begun.

The Teutonic polity.

We thus brought with us into Briton that form of the common Aryan speech which had grown up among the tribes of northern Germany. Wherever, during the first hundred and fifty years of the English settlement, the English arms reached, there the tongue of Rome and the tongue of Britain passed away. Their place was taken by the speech which, with the changes that fourteen hundred years have wrought in it, still abides the speech of England. It has changed, as all other languages have changed. It has, like all other languages, so changed that its older forms cannot now be understood without special study; but it has never lost its unbroken personal being. The English tongue has never been displaced by any other tongue, as the tongue of the Briton was displaced by the tongue of the English. It has lived on, spoken in different local forms in different parts of the land, changing from age to age, losing old inflexions, taking in new words; but it has changed simply as the nation itself has changed, without ceasing to be one and the same English nation; it has changed, as each man in the nation himself changes in his passage from childhood to old age, without ceasing to be the same personal being in old age which he was in childhood. And, with our form of the common Aryan language, we brought with us our form of another common Aryan possession, which still abides, also unchanged in its personal identity, never displaced to make way for any other system, but which has gone through even greater and more constant changes than our spoken language. We brought with us our own political and social system; that is, the form which the political and social system common to the whole Aryan family had taken among the tribes of northern Germany. A germ of political and social life was brought into Britain in the keels of Hengest, which, changing from generation to generation but never itself exchanged for any other system, borrowing from foreign sources but assimilating what it borrowed with its own essence, changing its outward shape but abiding untouched in its true substance, has lived and grown through fourteen hundred years into the law, the constitution, the social being of England.

Effects of conquest by sea.

The earliest law or custom of England was the law or custom of the old homes of the English settlers, with such modifications as the settlement in a land beyond the sea could not fail to bring with it. These modifications, as a moment's thought will show, must have been considerable. A conquest by land need not involve any sudden change; it does not necessarily place the conqueror in any wholly new set of circumstances. It may well be a mere territorial advance, a mere addition of field to field, in which the last-won territory does not call for any different treatment from the older territory immediately behind it. But a conquest by sea implies a breach of continuity; the old land is necessarily forsaken, and a fresh start has to be made in a new one. The political society of the old home may be reproduced in the new; but it is reproduced rather than continued, and it can hardly be reproduced without some measure of change. And a settlement made bit by bit, each step being won by hard fighting, such as was the English settlement in Britain, will be effected by all such influences as are likely to be strengthened by constant fighting for the possession of a new country. And in such a case, when the nation is an army in active service, when the chiefs of the nation are the leaders of that army, the influences which are most likely to be strengthened are those which tend in the direction of national unity. Or, what is almost the same thing, they are the influences which tend to strengthen the authority of the chiefs by whom the national unity is represented.

The *hide*.

The political and social state of the Low-Dutch tribes at the time of their settlement in Britain was still essentially the primitive Teutonic democracy, the state of things described by Tacitus, and which still exists, modified of course in the lapse of ages, but untouched by any violent change, in some of the smaller and more primitive cantons of Switzerland. The family is at the root of everything. The *hide* of land, the portion supposed to be enough for the maintenance of a single family, is the lowest territorial unit. The enlarged family, in Greek and Latin phrase the *gens*, tracing by natural de-

---

[1] *Beech* and *book* are the same word, just like the two senses of the Latin *liber*. *Write* is cognate with the High-Dutch *reissen*, just like *scribere* with *scrobs*.

The *mark* or *township*.

scent or by artificial adoption to a common forefather, real or imaginary, divine or human, is the lowest political unit. As in ancient Greece and Italy, it constantly bears the name of such supposed forefather. The Æscingas, the Scyldingas, a crowd of other such names, marked in Teutonic, just as in Greek, by the patronymic ending, are sometimes recorded in history or legend, sometimes simply left to be inferred from the local nomenclature of England and other Teutonic lands. The territory, originally the common territory, of such an enlarged or artificial family, formed the lowest territorial division, the *mark* or *township*. The cultivated land of each *gens* was fenced in by a boundary line of untilled land, forming the *mark* in the strictest sense. The township then and its inhabitants formed the lowest political unit, a unit having its own assembly and its own political organization. Such a political unit still forms the *gemeinde*, the *commune*, of other lands. This unit has been exposed in England to influences which have altered its character more thoroughly than it has been altered anywhere else. An ecclesiastical influence has changed the original *mark* into the half-civil, half-ecclesiastical *parish*. An influence of another kind changed the primitive community, holding its common land by its own right, into a body of tenants holding their land of a lord. The township which had passed through such a change became a *manor*.

The *hundred*.

It must always be remembered that, in the primitive polity, each larger group is formed by bringing together several of the smaller. Several *gentes* brought together formed in the Roman system the *curia*, answering to the Attic *φρατρία* and the Spartan *ὠβή*. The Teutonic counterpart of this group is the *hundred*. The name must in its beginning have meant a real hundred of some kind; but such names soon lose their proper force, and are used in a purely conventional sense. The hundreds of England are familiar as geographical divisions; but their traditional organization, administrative, judicial, and military, is fast passing out of memory. When the English first landed in Britain, and for ages after, that organization was fresh and vigorous. But it is quite possible that, even before the voyage of Hengest, the mere name of hundred had become purely conventional, and had ceased to imply an actual hundred of any kind.

The *gá* or *shire*.

As a group of *gentes* formed a *curia*, so a group of *curie* form a *tribe*. In the Teutonic nomenclature, the territory of the tribe is the *gá*, *gau*, *þeod*, or *scir*, in modern English *shire*, the *pagus* or *scira* of Latin writers. *Gá* or *gau*, a name familiar in Germany, but whose existence can only just be proved in England, is doubtless the elder name. *Shire* from *shear*, does not mean a group of lesser units, but in strictness a division, something *shorn* off from a greater whole. Both names are historically true. Of the existing shires of England some are really primitive *gás*, settlements of tribes, while others are in strictness *shires*, artificial divisions formed at a later time in imitation of the primitive *gá*. The West-Saxon shires are primitive *gás*, and two at least, those of the Sumorsætas and the Dorsætas, still keep the ancient tribal names. But the old tribal divisions of Mercia were wiped out in the Danish conquest of the ninth century. In the process of English reconquest the land was mapped out afresh into *shires*, strictly so called, shires grouped conveniently round a central town, and bearing the name of that town instead of the name of the ancient tribe. The shire, it is needless to say, is still a living thing throughout England, and from England it has spread itself, commonly under the French name *county*, through all lands ruled, settled, or influenced by England.

The *gá* was the lowest group which could exist as a really distinct political power. The mark and the hundred, like the *gens* and the *curia*, do not, at least in the finished system, whether Teutonic or Greek and Italian, aspire to the character of an independent state. The *gá*, like the tribe, might do so. The *gá* might be wholly independent; it might be dependent on some stronger neighbor; it might be incorporated into a kingdom, and sink into one of its geographical divisions. But in any case it kept its full and separate organization, its assembly with judicial, administrative, and legislative power, its chief bearing the title of *Ealdorman* or *Alderman* in peace, of *Heretoga*, *Herzog*—the *στρατηγός* of the Athenian tribe—in time of war. The alderman stood, like the territory of which he was the chief, in various relations. He might be an independent or a vassal prince; he might, by the incorporation of his *gá* with a kingdom, have sunk into a mere magistrate, appointed by the king and assembly of the whole kingdom. But the organization of the *gá* or *shire* remained in either case. So the Ramnes and Titienses were independent tribes, occupying their several hills. They joined together, to become the tribes whose union formed the earliest Rome.

The *kingdom*.

A system of *gás* or shires is thus the oldest fully developed form of the Teutonic polity. The process of grouping independent *gás* into a yet greater division was gradual, and went on much faster in some parts than others. The union of *gás* formed a *rice* or kingdom; the chief of the group thus formed was a *cyning* or *king*. What, it may be asked, was the difference between king and ealdorman? The question is a hard one; but one point of difference seems plain. The ealdorman was a ruler in peace and a captain in war. The king was more. Among the English at least, the kingly houses all claimed descent from the blood of the gods. Every king was a son of Woden. A vague religious reverence thus gathered round the king, in which the ealdorman had no share. He was also the head of the highest political aggregate which the ideas of those days had reached. He was, as his name implies, the head of the *kin*, the nation. The rule of the ealdorman was tribal, and merely earthly; the rule of the king was national, and in some sort divine.

Nature of kingship.

Kingship then, the leadership of a nation, was, in the ideas of those days, an office and not a property. As an office, it demanded qualifications. It demanded in truth the highest qualifications, the qualifications needed in one who was to be the leader of his people in peace and in war. Such an office could not be trusted to the chances of any law of strict hereditary descent. Or rather the notion of any law of strict hereditary descent was a thing which had not yet presented itself to men's minds. Kingship then was elective; the leader of the people became such only by the choice of the people; but the right of choice was not wholly unlimited; the king, so custom and tradition taught, must come of the stock of Woden. But within that stock one member of it was as sacred, as kingly, as another. The son of a deceased king would doubtless be his most obvious successor, if there was nothing specially to suggest another choice; but he had no further claim beyond any other man of his house. Traditional rule dictated that the choice should be made from the royal house: reason dictated that it should fall on the worthiest of the royal house. The union of these two feelings led to that mixture of election and hereditary succession which we find among the ancient English, as among most other nations at the same stage. The king is chosen; but he is chosen, under all ordinary circumstances, from the one kingly line. He is not chosen as the heir or the representative or the next of kin of the former king. He is chosen as that one of the kingly house whom the people think fit to choose. He is chosen from the house; therefore kindred in the female line goes for nothing. The son of a king's daughter does not belong to the kingly house; he is therefore not eligible for the kingly office. But the most distant kinsman in the male line is as much one of the kingly stock as the king himself, and the choice of the nation may fall upon him. There is no point in our early constitution which is more important to insist on than this. Nothing has led to more and greater misconceptions than carrying back the legal theories of later days into earlier times, than fancying that every prince was an usurper whose succession to the crown did not take place according to rules which he and those who choose him had never heard of, and would not have understoood.

Gradual growth of kingship.

The institution of kingship came in gradually among the Teutonic nations, and its growth was much slower in some parts than in others. In the time of Tacitus, kingship was clearly far from universal. By the time of the Wandering of the Nations, when scattered tribes had begun to gather together in greater masses, it was clearly the rule. Among the Saxons its growth was specially slow. Among the Old Saxons who stayed behind in Germany it never came in at all. So both the Saxon and the Jutish leaders came to Britain, not as kings, but as ealdormen or *Heretogan*. They were of the stock of Woden, and were therefore qualified for kingship; but they did not take the kingly title till they had made a firm settlement in the country. The institution of kingship seems to have grown up in different ways in different parts of England. From all that we can see of the Anglian kingdoms, they were formed by the union of several states into one greater kingdom. In such a case the ealdormen or kings of the incorporated states might go on under the superiority of the common king; but the king sank into the *under-king*, kingly in descent, kingly in office among his own people, but owning the external authority of the common king. In Wessex the course of things was otherwise. There too we find several kings at once; but all are, not only of the stock of Woden, but of the house of Cerdic. There was moreover always one head king over the whole West-Saxon nation. Something of the same kind seems to have been the rule in Kent. We see, though dimly, signs of a separate, and doubtless subordinate, kingdom of the West-Kentishmen.

Earls and *churls.*

Among the English conquerors of Britain we see from the beginning the same elements of political life which we see among the other Teutonic nations, and which were doubtless parts of the original Aryan inheritance. The inhabitants of the land fall into two great classes, the free and the unfree, classes each of which is again capable of subdivision. Every freeman is a citizen and a soldier; he is, or may be, a landowner; he has his place in the army, his voice in the assembly. But all freemen are not equal in rank and honor. There is a broad distinction, a distinction so old that its beginning cannot be traced, between the man who is simply free and the man who is not only free but noble. This distinction is expressed in different Teutonic dialects by the rhyming names *eorl* and *ceorl*, *jarl* and *karl*, in modern English form, *earl* and *churl*. These last two words have in modern use changed their meaning. In their oldest sense they answer to the modern phrase *gentle* and *simple*. It is impossible to say in what the privileges of the *eorl* consisted, nor is there anything to show that they were oppressive. But the distinction was broadly drawn, and the birth of the *eorl* clearly entitled him to special respect and honor, if to nothing more. And such special respect and honor would, in the common course of things, give the *eorlas* a preference for all offices and distinctions, whether honorary or substantial, which either king or people had to bestow. The unfree class again were clearly not on a level in all times and places. The actual slave, the *thrall*, the *þeow*, is found everywhere. The class is formed and recruited in two ways. The captive taken in war accepts slavery as a lighter doom than death; the freeman who is guilty of certain crimes is degraded to the state of slavery by sentence of law. In either case the servile condition of the parent is inherited by his children, and the slave class goes on increasing. The existence of other classes between the absolute slave, the mere chattel of his master, and the full freeman, with his place in the army and his voice in the assembly, is possible and frequent, but not universal. It was a natural position either for the enfranchised slave, for the foreign settler, or for the conquered enemy who was admitted to more favorable terms than usual. Out of such cases there might easily arise a class, personally free, but not possessed of the full political rights of freedom. There might indeed be many stages of imperfect freedom or mitigated bondage between the personal slave and the free churl. To some of these intermediate ranks the slave might rise or the freeman might sink. But such a class, though often found, is not a necessary element in Teutonic society. But the *eorl*, the *churl*, and the *thrall*, are found everywhere. They are taken for granted; and legend represented the three classes as called into being by separate acts of the creative power of the gods. All these, as essential elements of Teutonic society, are found among our forefathers from the beginning.

The slave.

But in all Teutonic societies another principle was at work, which began very early to change the nature of primitive Teutonic society. That society was a community, a community which, like all other communities, admitted distinctions of rank, wealth, and office, but where each man, earl or churl, held his place strictly as a member of the community, bound by its laws, and owing to it his duties in war and in peace. The Teutonic community differs from the Greek or Italian city in so far as it is not fenced in with walls, but has its inhabited places spread over the whole of its territory. But its leading political conception is essentially the same. The king or ealdorman is clothed with the authority of a leader. The earls have their privileges, in whatever those privileges may consist. In the assembly the king and the earls may consult and propose, while the simple freemen merely say yea or nay. But each discharges his duty in his higher or lower place strictly as a member of the community. His duty, his allegiance, is due to the whole society, not to any particular member of it. This primitive system was from a very early time broken in upon by the practice of personal commendation to a lord. Such commendation was in its beginning strictly military.

Commendation.

In the primitive community the army is simply the nation under arms. Each man discharges his duties in war, like his duties in peace, in obedience to the law of the society of which he is part. But at a very early time—for the picture stands out distinctly in Tacitus—successful and popular leaders began to gather round them a band of special followers, devoted by a personal tie to themselves. Where the chief led they followed. The tie was mutual. For the chief to forsake his followers, for the followers to forsake their chief, was alike shameful. A personal tie thus arose between man and man, alongside of the political tie which bound each member of the community to the community itself. The king, ealdorman, or other chief, became something more than the magistrate and captain of the community. He became the personal lord of some particular men among its members. They became his *men*, bound to do him personal service. He became their *hlaford*, *lord*,—in the primitive meaning of the word, *loaf-giver*,—who was to reward the service which they rendered to him. The new principle spread, and gradually made its way into every relation of Teutonic society. The personal following of the king, his *gesiðas* or companions, his *þegnas* or servants, grew into a nobility of office. Thus arose the nobility of the *thegns*, which gradually supplanted the older nobility of birth, the nobility of the *earls*. The growth of the royal power, and the growth of the importance of the thegnhood, naturally went hand in hand. A power like that of kingship, when once established, is sure to grow. It is specially sure to grow in a period of conquest. The king and his personal followers are likely to be foremost in warfare; and each increase of territory increases the power and dignity of the king, and therewith raises the condition of his followers. We see the institution of thegnhood in full force at an early stage of the Teutonic settlement in Britain. We may feel sure that the Teutonic settlement in Britain greatly served to strengthen it. And we cannot doubt that the change from the nobility of office to the nobility of birth greatly affected the position of the churl or simple freeman. By breaking down a barrier which was purely a barrier of birth, it made it easier for individual churls to rise to a higher rank. But by gradually confining office and power and influence to the king's personal following, it tended to degrade the position of the churls as a class.

Growth of the *thegns.*

This relation of a man to his lord might be on any scale. It might be contracted between men of any rank, between a weaker and a more powerful king, between a poorer and a richer churl, or between men of any of the intermediate ranks. In its higher degrees the relation was political; in its lower degrees it was purely social. It spread alike upwards and downwards, till it became the rule and not the exception. It came to be looked on as the business of every man to seek a lord, and at last the lordless man had legal disadvantages. Still the relation between a man and his lord, the voluntary commendation of a man to his lord, was in itself a relation purely personal, and had nothing to do with the holding of land. But the two things might easily be brought into connection with one another. And as the practice of commendation grew, analogous changes gradually affected the tenure of land. In both cases the personal relation grew at the expense of the public relation. The community lost, and the individual gained.

Tenure of land.

The land of a Teutonic community is primarily the property of the community itself. It is *folkland ager publicus*, the land of the people. But here, as everywhere else, private property in land gradually arose; that is, the community granted out parts of the common possession to its individual members. The pictures of Cæsar and Tacitus show that, in the time between them, the institution of private property in land had already made some advances. When it has once begun, it is sure to advance. It would specially advance with every conquest; each man would claim to have his personal share of the soil which he had helped to win. Thus, alongside of the *folkland*, the land of the community, grew up

Folkland and bookland.

Origin of manors.

the private estate, the *eðel*, *odal*, or *allod*. This is land which is a man's very own, the gift of the community, held according to the laws of the community. It is not the gift of this or that man, owing any service to this or that man. As the king's power grew, as he came to be looked on more and more as the representative of the community, the land of the community came step by step to be looked on as his land. In the six hundred years between the English conquest of Britain and the Norman conquest of England, the *folkland*, the *ager publicus*, passed into *terra regis*, the land of the king. As the community could at all times grant away its own land, the doctrine gradually grew that the king, the head of the community, could grant it away also. In the first stage he granted it only with the assent of the community; in a later stage he came to dispense with that assent. Land thus *booked*, granted by a written document, to whomever the king would, but of course mainly to his personal followers, became *bookland*. The lord was the giver of bread to his man, and the land of the community was the noblest form of bread that he could give him. And, as things went on, he might sometimes grant him more than the land itself. The primitive community, great or small, from the township to the nation, had the rights of a community; it had judicial and administrative powers. From those powers it might be deemed a privilege for the royal grantee to be exempted. He might be clothed with exceptional judicial powers within his own lands; the next stage would be for those powers to spread themselves over the lands of his neighbors. The privileged landowner within a community might grow to be the lord of the community. The township might grow into the lordship; its free assembly might grow into the court of the lord; the land itself, so much of it as escaped the lord's clutches, might be declared to be held under the lord. In the fictions of lawyers things are commonly turned about. The exception is declared to be the rule, and the rule to be the exception. If the community contrives to save any fragments of its ancient rights from the grasp of the lord, those fragments are at last judicially declared to be held only by the lord's grant. If no grant can be found in real history, legal ingenuity will be ready to assume one.

The *trinoda necessitas.*

All land was by immemorial custom burdened with three duties. To the repair of bridges and the repair of fortresses all land was bound to contribute. And the duty of every member of the community to serve in arms when called on for the defence of the community was so far a charge upon the land that a certain amount of land had to supply a certain number of men. But this is not military service in the later sense; the land is not held of a lord by a military tenure; the personal duty of serving in the *fyrd*, the militia of the community, is not a duty paid by the man to his lord, but by the member of the community to the community itself. The primitive militia of the community and the personal following of the lords form two distinct elements, which often appear as distinct in the records of early warfare. The strictly military tenure, the holding of land from a lord on condition of doing him military service, does not concern us as yet.

Influence of the insular conquest.

The English settlers in Britain thus brought with them all the elements of Teutonic society as they stood in their day. The distinction of *earl*, *churl*, and *theow* went on in Teutonic Britain as it had gone on in Germany from time immemorial. Marks, hundreds, *gás*, arose on the conquered soil of Britain, as they had already arisen on the ancestral soil of Germany. But the circumstances of the conquest could not fail to hasten the process by which the smaller communities were gradually gathered into the larger. That the *gentes* settled by marks is plain from nomenclature; and, much as in Greece the same Doric tribes helped over and over again to found distinct Doric settlements, so settlements of the same *gens* formed in distant parts of England bore the same name. The *gens* of the *Wellingas*, for instance, appears at Wellington, in Somerset, at Wellington in Shropshire, and at Wellingborough in Northamptonshire. But the mark never could have had the same importance in England which it had in Germany. Such a settlement could never maintain itself alone in a country which was being conquered bit by bit. Every settlement must from the beginning have relied on the help of its neighbors, alike for further conquests and for the defence of what it had already won. Everything must have tended to closer union among the communities which grouped together to form the hundred, the *gá*, and the kingdom. The *gá* must, from the first, have been the lowest group capable of real separate being. And in Wessex at least, each *gá*, as it was formed, was placed under the rule of an under-king of the royal house. In central England the *gás*, each doubtless under its separate king or ealdorman, often remained really distinct, till they were swallowed up by the growing power of Mercia.

Greater and lesser assemblies.

The *Witenagemót.*

All these groups, greater and smaller, mark or township, hundred, *gá* or shire, and kingdom, kept the constitution of the primitive community, modified by such changes as change of circumstances could not fail to bring with them. So far as we can get any glimpses of any of them, we see in all alike the same elements. There is in all the presiding chief, the leading men proposing and debating, the whole body of freemen saying *yea* or *nay* to their proposals. The chief change was one of the highest practical moment, but which was not the result of any sudden revolution, or even of any enacted law. Democracy may change into oligarchy by the mere working of the laws of time and space. The simple freeman may have the same right to appear in the assembly of the kingdom which he has to appear in the assembly of his own township. But he is far from being so likely to be found there. Mere distance settles the question. Only the more wealthy and the more zealous will go long journeys to take a part in public affairs. Thus the assembly, popular and unlimited in its theoretical constitution, silently narrows till it becomes an assembly of the chief men, with such only of the common freemen as live near the place of assembly or are drawn to it in greater numbers than usual on some occasion of special excitement. The assembly of the kingdom, the *Witenagemót* or Meeting of the Wise, gradually took this character. There was no need to shut the mass of the people out; they shut themselves out. In the *Scírgemót*, the assembly of the shire, we see the working of the same law. Attendance has to be enforced by law; at least a *minimum* number for each district is fixed. This practically comes to confining the assembly to those who are specially summoned; for a special summons to certain members is always found to lead in the end to the exclusion of those who are not summoned. In this way, without any formal change, by the mere working of natural causes, the popular character of the primitive assemblies died out. It died out of course more thoroughly in the higher assemblies than in the lower. The great assembly of the kingdom, in theory the gathering of all the freemen of the kingdom, shrank up into an assembly of the king's thegns, subject to the appearance of more numerous bodies of men on specially stirring occasions, and to the presence of the citizens of the town where the assembly was held, when it was held in a town. This will always happen whenever the assembly of a large country is primary and not representative. The more purely democratic its constitution, the more sure is it to shrink up into oligarchy. But it is well to remember that, as long as our national assemblies kept any traces of their primitive shape, those great meetings which chose and deposed kings, which made and repealed laws, which made war and peace, were, in theory at least, meetings not of this or that class, but of the nation.

English towns.

No inheritance from Rome.

In the last paragraph we have been carried on somewhat beyond the date which we had reached in our narrative, somewhat beyond the period of heathen England. In so doing we have incidentally made mention of towns. The origin of the English towns certainly comes within the period with which we are immediately dealing. Than that origin no part of our subject is more obscure. But one negative point we may assert with full confidence; there is no trace of any possession, of any law or custom or office, which the cities and boroughs of England have inherited from the older municipalities of Rome. Whatever likeness may be seen between the two is due, beyond all doubt, not to direct derivation, but to the eternal law according to which like causes produce like results. In the primitive Teutonic system, in the system reaching from the mark up to the kingdom, there was no place for walled towns. The early Teuton looked on the walled town as a prison. When in after times strictly English towns arose, their position was wholly different from that of the Roman towns. The Roman town was the centre and mistress of everything within its own range. The city was a commonwealth; the surrounding country was little more than a subject district. Without a city there could, in Greek and Roman ideas, be no organized political or social life. In the Teutonic system, on the other hand, towns were wholly unknown, and they have never in any Teutonic country come to fill the place which they have always filled in southern Europe. The difference between English social life and that of the southern part of the European continent, the shrinking of the English upper classes from town life in any shape but that of the capital of the kingdom, dates from the very beginning of our history. In southern Europe the city is an essential of life; in England it is a kind of accident. When English towns did arise, they were simply districts where houses stood thicker together than elsewhere. The town was a mark, a hundred, perhaps a shire, in which more men lived within a smaller space than they lived in other marks, hundreds, or shires. But the question here arises, When did the English conquerors of Britain begin to occupy walled towns at all? It is certain that in many cases the Roman town was simply forsaken by its English conquerors. At Pevensey and Silchester the inhabitants were slaughtered, and the walls left standing empty for ever. It is equally certain that in other cases, as at Bath and Chester, the Roman walls, after standing empty for a while,—in the case of Chester for the ascertained period of three hundred years,—were again inhabited by settlements of Englishmen. The question is whether this last was the case with all the Roman sites which were won during the time of heathen conquest and which became English towns in later times, or whether any of them were continuously inhabited, and simply passed from British to English occupiers. It is quite certain that in some cases the period of desolation, if there was any, must have been short. If London, Canterbury, York, Lincoln, Colchester, ever stood void and forsaken, they must have been settled afresh very soon. Some at least of them were again inhabited cities at the end of the sixth century. London and York, above all, would doubtless hold out long after all the surrounding country had been subdued. They may have held out till the conquerors had laid aside somewhat of their first rudeness, and had learned to see that a city and its walls were a valuable possession. In some then of the greatest cities we may believe that their conquest was comparatively late, and that, when they were conquered, they immediately became dwelling-places of the conquerors. It may then well be that there never was a moment when the walls of Eboracum, the walls of Augusta—the old city once called London and afterwards to be called London again—ceased to gird in the dwelling-places of man. The point is that the connection between Eboracum and *Eoforwic*, between Augusta and *Lundenbyrig*, is a connection purely geographical. The Briton went out, and the Englishman came in. The rulers and the people of the Teutonic commonwealth had no political succession from the rulers and people of the Roman commonwealth which had once occupied the same soil.

Old-English law.

Of English law during this time we have no contemporary monuments. But law in its first form is the same as custom; the earliest written codes are simply the customs of the time set down in writing. We have no written English laws till after the introduction of Christianity; the oldest written code bears the name of the first Christian king. But the dooms of Æthelberht, and the dooms of much later kings, are, in all those points which are not clearly modified by Christianity, good evidence for the laws or customs of heathen times. Our oldest laws set before us a society in which the position of the king is well marked, and where he summons his people to him, doubtless to the general assembly of his realm. The classes of *eorl*, *ceorl*, and *þeow* are plainly marked. Of the *thegn*, in the earliest code of all, there is no mention. We have mention also of the classes intermediate between the freeman and the slave, the *læt* namely and the *esne*. But we see no signs of a society containing men of distinct nationalities; there is nothing answering to the mention of the Romans in the codes of the continental Teutons, or to the mention of the Welsh in other English codes which were drawn up at a later time and under other circumstances.

The *wer-gild.*

The first English laws are drawn up for a purely Teutonic people keeping their old Teutonic customs. Two of the most characteristic features of ancient English law are there in their fulness. Every man has his value, but his value differs according to his rank. Every freeman's oath is worth something; but the oath of the earl is worth more than the oath of the churl. Death or injury done to any man has its penalty; but the penalty is higher or lower according to the rank of the person injured. In short, in all the early codes, in England and elsewhere, the state has already stepped in to regulate and modify the natural desire for vengeance on the part of the injured person or his kinsfolk. The natural avenger of the slain man seeks for the blood of the slayer; the state steps in and persuades him, in Teutonic England no less than in Homeric Greece, to accept of a money payment instead of the gratification of his vengeance. The right of a man in a state of nature to do himself justice with the strong arm, the *fœhde* or *feud*—the source of the private war and the duel of later times—is not wholly set aside; but it is regulated and modified, and confined to certain extreme cases. The state in all such cases steps in as a mediator between the wrong-doer and the man who seeks to avenge himself upon the wrong-doer. It takes the right of punishment out of his hands into its own. The later legal doctrine that a wrong done to any member of the community is a wrong done to the community itself and to the king as its head, has not yet been reached. A crime done against the king is more heavily punished than a crime done against another man; but that is simply because the king fills the highest place in the long gradation of ranks. The first notion of a crime against the state as such seems to come out in that venerable enactment which looks like the origin of one branch of our modern privilege of parliament—"If the king his people to him call, and to them then man evil do, twofold bot and to the king fifty shillings."

The *fœhde.*

The Teutonic religion.

The language, the laws, and the constitution, which the English settlers in Britain brought with them from their older homes were in the course of ages to undergo many changes; the newer forms were to part away widely from the older; but all was to be gradual growth, gradual change; there was to be no sudden revolution, no supplanting of one tongue by another tongue, of one law by another law. But the English had brought with them from their older homes another possession which was to pass utterly away, a system which was to be thoroughly supplanted by a rival system of foreign birth. With their language and their laws they had brought with them their religion; and while their language and their laws were to abide, their religion was to pass away. The old religion of the English was, like their language and their laws, that form of the common Aryan heritage which had grown up among the people of northern Germany. The old Teutonic faith is best known to us in the poetry and legends of that branch of the race which clave to it longer than the rest, in the Eddas and Sagas of the Northmen of Scandinavia. Our system was doubtless essentially the same as theirs, though, as it was laid aside by both High and Low Germans earlier than it was in Scandinavia, it may never have reached among them the same full poetic development which it reached in more northern lands. The names of the chief gods, Woden, Thunder,[1] Frigga, and the rest, are the same with only dialectic differences. The name of one of our old gods is of special interest; the great Aryan power of the sky, Zeus himself, appears among us, though with lessened honors, under the English form of *Tiw*. He, with his fellows, gives his name to a day of the week; and his name, like that of his fellows, may be traced in the local nomenclature of our land. Of that land the Teutonic gods took full possession along with their worshippers. The creed of the Roman and the Briton passed away with those who professed it. The still unconquered Welsh never thought of undertaking the work of missionaries among the conquerors and destroyers of their brethren. And they would have had small chance of being hearkened to by those conquerors and destroyers, if they had undertaken such a task. It was otherwise when a new light came from lands beyond the sea, between whose people and ours there reigned no such mutual scorn and hatred. And above all things, it was otherwise when the call to a new faith came directly from the capital of the western world. The English folk were first called on to cast aside the faith of Woden and to embrace the faith of Christ by men who came on that errand from Rome herself at the bidding of the acknowledged father of Western Christendom.

---

[1] Þunær, Þunor, in modern form *Thunder*, is the true English name. The more familiar form *Thor* is, like most Scandinavian forms, a contraction. *Thursday* is for Þundresdæg.

Conversion of the English to Christianity.

The conversion of the English to Christianity was not only one of the great turning-points in the history of England; it was one of the great turning-points in the history of Christianity itself. It was, as far at least as the West is concerned, a conversion of a kind that was altogether new. Christianity is historically the religion of the Roman empire; wherever the influence of Rome, East or West, has spread, there Christianity has been dominant; beyond that range it has taken little root. The Teutonic conquerors of the continental provinces accepted the religion of the empire as they accepted its laws and language. At the end of the sixth century, all the subjects, all the western conquerors of Rome, were Christian. Heathendom took in only the lands, like Scandinavia and Germany beyond the Rhine, which had never formed part of the empire, together with the one Western land which had wholly fallen away from the empire. The conversion of England was the first strictly foreign mission of the Western Church. It was the first spiritual conquest of a people wholly strange, a people who stood in no kind of relation to Rome and her civilization. It was the first act of a long series of spiritual conquests which gradually brought all Europe within the pale of the Church. And it was more than the first act of the series; it enlisted in the missionary work the people who were to send forth the most successful apostles to other lands. The conversion of England directly led to the conversion of heathen Germany and Scandinavia. Gregory, who was so anxious for the soul of Trajan, was himself a spiritual Trajan, enlarging his spiritual empire by conquests more lasting than the earthly conquests of Trajan himself. The conversion of the English to Christianity carried with it the readmission of Britain into the general world of Europe. Throughout the fifth and sixth centuries the notices of the affairs of Britain in continental writers are rare and meagre beyond expression. They show that Britain had fallen back into the isolation of the days before Cæsar; it had again become an unknown world, a world about which any kind of fable might be safely uttered. Such rare intercourse as that world had with the Roman world was through the Teutonic masters of Gaul, the Franks. And it may be taken as a sign that, in the latter years of the sixth century, Kent at least must have been striving to bring itself within the European circle, when we find its king Æthelberht married to a Christian wife, the daughter of a Frankish king. It is to be noticed, however, that neither the queen herself nor the Frankish bishop whom she brought with her seems to have directly done anything for the conversion of the king or his people. That work could be done by nothing short of the majesty of Rome.

Roman and Scottish share in the conversion.

One point which cannot be too strongly insisted on at this stage is that the Church of England which was founded by Augustine has nothing whatever to do with the early British Church. In after times certain British dioceses submitted to English ecclesiastical rule, and that is all. The Christianity of England did not come wholly from any single source; and one of the sources from which it came was found within the British islands. But that source was not a British source. The Roman planted; the Scot watered; but the Briton did nothing.

No British share.

He not only did nothing; he refused to do anything; he would have nothing to say to Augustine's invitation to join in preaching the gospel to the heathen English. Theologians may dispute over the inferences which may be drawn from the fact; but the historical fact cannot be altered to please any man. The Church of England is the daughter of the Church of Rome. She is so perhaps more directly than any other Church in Europe. England was the special conquest of the Roman Church, the first land which looked up with reverence to the Roman pontiff, while it owed not even a nominal allegiance to the Roman Cæsar.

The conversion gradual.

The conversion of the English was gradual, and, on the whole, peaceful. Christianity was nowhere forced on an unwilling people by fire and sword, as was done in some later conversions. We find wars between Christian and heathen kingdoms in which religion is clearly one great animating cause on both sides; but we do not hear of persecutions or wars of religion within the bosom of any kingdom. As a rule, the king is converted first. The great men follow, perhaps in duty bound as his thegns. The mass of the people follow their leaders. But all is done without compulsion; if conversion was not always the result of argument, it was at least the result of example. This may perhaps show that the old religion sat somewhat lightly on its votaries, and in some cases the new religion seems to have sat somewhat lightly on its converse. The Christian king sometimes had heathen sons, and their accession was followed by a relapse. But, in the space of about a hundred years, all the English kingdoms had become Christian. The men of Wight in their island, and the men of Sussex isolated between the sea and the great wood, were the last to cleave to the idols of their fathers. The seventh century was the great time of struggle between the two religions. It was also the time when Mercia first stood forth as an equal rival with Northumberland, Wessex, and Kent. Kent soon sinks into a secondary rank, and leaves the first place to be disputed between the three other great powers.

Conversion of Kent, Essex, and East-Anglia;

At the beginning of the period when the first Roman missionaries came, in 597, the Bretwaldadom, which had been held by Ælle of Sussex and Ceawlin of Wessex, was held by Æthelberht of Kent. He is expressly said to have been supreme over all the kingdoms south of the Humber. That this supremacy was not a mere name is shown by the fact that his safe-conduct held good when Augustine crossed the still heathen land of Wessex to confer with the British bishops on the banks of the Severn. Under Æthelberht, the Kentish Church was planted by Augustine, and from Kent the new teaching spread over Essex and East-Anglia.

of Northumberland.

The Northumbrian Bretwaldas.

From Kent too came the first conversion of Northumberland, and with it of Lindesey, by the preaching of Paulinus under the powerful Bretwalda Eadwine of Deira. That king had, before his conversion, conquered the Welsh kingdom of Loidis and Elmet, and had made Northumberland the first power in Britain. His first rivalry was with Wessex, which he brought to acknowledge his supremacy. After his conversion he had to endure the more dangerous enmity of two powers which united against him on different grounds. The Teutonic conqueror was hateful to the Briton Cædwalla, whose kingdom of Strathclyde, cut off from his southern countrymen by the victory of Æthelfrith, was still a powerful state.

Penda of Mercia.

The Christian convert was hateful to the heathen Penda, under whom Mercia first became great. Before the two Eadwine fell at Heathfield in 633, and with him fell for a moment the Christianity and the power of Northumberland. The new power of Mercia grew equally to the south at the expense of Wessex. But this first burst of Mercian power was not to be lasting. Before long Northumberland was again united, powerful, and Christian, under the Bernician Bretwaldas, and her power and religion were first restored for a while by Oswald the saint. He overthrew his British and Christian enemy at Heavenfield in 635. This is a date of importance. In some sort it marks the completion of the English conquest. Much British land was still to be won by hard fighting; but Cædwalla was the last British prince who could wage aggressive and dangerous warfare against an English rival. Against his heathen and English enemy Oswald was less successful. He, too, like Eadwine, fell before Penda at Maserfield in 642. A time of confusion and division followed, but under Oswiu, the next Bretwalda, Northumberland rose again. In 654 Penda fell before him at Winwedfield, and the armed strife between Christianity and heathendom was at an end.

Conversion of Mercia.

The second conversion of Northumberland, and the conversion of Mercia which followed the fall of Penda, were chiefly the work of the Scots. That name, it must be remembered, though it does not shut out the Scottish colony in Britain, primarily means the original Scots of Ireland. Columba and his successors in their holy island linked the two together, and both were zealous in the missionary work, both in Britain and on the continent. But, though a large part of England thus owed its Christianity to the Scots, yet the special Scottish usages did not abide in the churches of Northumberland and Mercia. After much debating, the Bretwalda Oswin adopted, on behalf of

Conversion of Wessex, Sussex and Wight.

his people, the usages of Rome and Kent. Meanwhile Wessex had been converted by an independent mission from the Franks of Gaul under its apostle Birinus. The heathendom of Sussex gave way in 681 to the preaching of the Northumbrian Wilfrith, and a few years later the men of Wight, the last abiding-place of the old gods, were partly converted by Wilfrith, partly slaughtered by the West-Saxon Cædwalla. All England was now Christian; and the English Church was finally organized between 668 and 690 by Theodore of Tarsus. The Roman, the Scot, and the man of the East, thus all worked together to bring the English conquerors of Britain within the pale of the Christian Church, and thereby within the general world of Europe.

Effect of the conversion.

Addition to the elder legislation.

Ecclesiastical divisions.

There is something wonderful in the way in which Christianity fitted itself in, so to speak, to the old Teutonic institutions of England. The change in men's thoughts, the change in their ways of looking at most things, must have been great; but there is no sudden break. The old political and social state goes on; the old laws and institutions are not abolished; they are hardly modified; all that happens is that many new laws are inserted among the old. But the laws bear the old character. The old scale of ranks is enlarged to take in some new members, in the form of the various degrees of the Christian priesthood. Some new crimes are forbidden; some new observances are enjoined; but the spirit of the law, the nature of the penalties, the manner of their execution, remains the same. The various ranks of the clergy have their value, in Teutonic fashion, along with the various ranks of the laity. Churches arose, and the fabrics, with their ministers and their property, were placed under the protection of the law. Provisions against idolatrous practices are found; but the old faith passed away so easily that but little legislation of this kind was needed. The land received a new geographical division in the form of ecclesiastical provinces and dioceses; but these commonly followed the existing civil geography. The extent of the bishop's diocese coincided with that of some kingdom or principality, and, as the ecclesiastical divisions underwent, till quite late times, much less change than the civil ones, the boundaries of the dioceses are our best guides to the boundaries of the old kingdoms and ealdormanships. Nowhere was the Church more thoroughly national than in England. The old assembly of the shire received the bishop as a new chief, along with the ancient ealdorman, and the two sat together jointly to hear matters which the more minute jurisprudence of a later time divided into causes ecclesiastical and causes temporal. Bishops, abbots, and other churchmen, became prominent in the counsels of kings and in the assemblies of the nation. A century or two later, we even find them leading the national armies to battle. Through the whole native history of England, we find no traces of any of the controversies between Church and State which show themselves in later times. In truth, Church and State did not exist as two distinct bodies; they hardly existed as two distinct ideas. As the army was the nation in its military aspect, so the Church was the nation in its religious aspect. The leaders of the body might be different according to the matter in hand; but the body itself was one.

National character of the English Church.

This strongly national character of the ancient English Church naturally followed on the time and manner of the conversion of the English nation. The English were not like the Teutonic conquerors on the continent, in whose eyes the Church was a Roman institution, alongside of other Roman institutions. In Gaul and Spain, for some generations after the Teutonic conquest, ecclesiastical power and office remained in the hands of the conquered. In some later conversions the Church was a foreign institution through an opposite cause. It was an institution forced on the people by their conquerors. In England neither of these causes of separation had any being. The English of their own free will accepted the creed of foreign teachers; but the church was not to them a foreign institution. The first two or three bishops of each see were necessarily strangers; but as soon as Englishmen were found fitted for such offices, they held them to the exclusion of strangers. It is hard to find a foreign prelate in England between Theodore of Tarsus and Robert of Jumiéges. Again, when England was converted, the privileges of the clergy as an order, the powers of the bishop of Rome as their head, were things which were still in their infancy. The claims made by the clergy and the popes in the eleventh, twelfth, and thirteenth centuries would have been unintelligible either to Æthelberht or to Augustine. There was nothing in England to part off the clergy, as a body having feelings and interests distinct from the rest of the nation. There was nothing to tempt the Roman bishops, subjects as they still were of the Roman emperors, to put forth the claims of a Hildebrand or an Innocent. There was nothing to make them claim from the newly founded English Church anything beyond the reverence due to a parent from a child who has already reached full age.

Power of bequests.

In short, if we look through our early law, and seek for changes in the law itself—as distinguished from legislation on new subjects—which can be said to be directly owing to the change of religion, we shall find few indeed. It is indeed very likely that the power of bequeathing property by will was introduced by the Roman clergy. There is a remarkable reference to the practice which implies as much;[1] and we know that the wills of dead men were a matter which the clergy took largely into their own hands, and which became in the end a subject for the specially ecclesiastical jurisdiction. Yet the power of willing may have grown up in England, just as it did at Rome. In the beginning a will is an exceptional act. The testator prays the community to allow his goods to be disposed of in a particular way. The confirmation gradually becomes matter of form; at last it is altogether dispensed with, and the power of bequest, once a privilege granted in a particular case, becomes the common right of every man. Still there is a strong likelihood the other way, and it may well be that the power of bequest has really been transferred from the Roman law to that of England. Only, if so it be, it must be remembered that it is no heritage from the inhabitants of the Roman province of Britain. It is something which was brought in afresh, as part of the ecclesiastical system of Gregory and Augustine.

Corporate property.

Another novelty in our law, which was directly owing to the conversion, was the institution of ecclesiastical property. This is plain on the face of it. Nothing could be given for the support of the new religion till the new religion had been accepted. But the institution of ecclesiastical property involved something more than this. If it did not from the beginning imply the legal doctrine of corporate property, it at least soon grew into it. This doctrine is something wholly distinct from the primitive communal property. It presupposes the intermediate stage of private ownership. The land is first cut off from the common possession to form the particular possession of this or that person. Then, by a legal fiction, several persons are clothed with the attributes of a single person, and the artificial being called a corporation appears. Such corporations were quite familiar to Roman law; but it is inconceivable that any such subtlety should have been thought of in primitive Teutonic times. The king or ealdorman, who gave lands to this or that church,—commonly under the formula of giving to God, or to such and such a saint,—if he did not at once create, at least paved the way for, all the fictions and subtleties of law with regard to corporations of all kinds, lay and spiritual, aggregate and sole.

Ordeal and wager of battle.

It was also doubtless owing to direct Christian influence that the early jurisprudence of England came to differ in one singular point from that of other Teutonic nations. The wager of battle, an original Teutonic institution, one which was brought again into England in later times, seems to have been altogether disused between the conversion and the Norman conquest. It has an English name, the *ornest;* but it is quite unknown to English law or English usage. Its place is taken by the direct appeal to the judgment of God in the form of the ordeal. The divine power, it was held, would directly interfere to save the innocent and to punish the guilty. We need not suppose that the ordeal itself was an invention of Christian teachers. The same idea may be

[1] The Norman writer William of Poitiers (p. 128 Giles) makes Harold thus answer William's claim by Eadward's bequest:—"Ab eo tempore quo beatus Augustinus in hanc venit regionem, communem gentis hujus fuisse consuetudinem donationem, quam in ultimo fine suo quis fecerit, eam ratam habere." It is an odd quarter to go to for a statement of English law, but its soundness can hardly be doubted.

found in many customs in other parts of the world. But it must be owing to direct Christian teaching that the judgment by hot iron or hot water altogether drove out the more warlike appeal to the judgment of battle, so that this last came in again in after times in the guise of a foreign innovation.

New Latin infusion into English.

But, small as were the direct legal or political changes which it wrought, the conversion of the English, even setting aside its purely theological and spiritual side, was the greatest event in the history of our nation. The effects which it wrought were great and manifold. The Roman missionaries brought with them a new learning, a new culture. The little influence which Rome had on our language and laws, before the great continental infusion of later times was due far more to the days of the conversion than to the days of the first conquest. Our forefathers translated a great number of ecclesiastical terms, some of which we have come again to use in a Latin shape. Still, as new things must have new names, the Roman missionaries brought into our language a good many Latin words to express ecclesiastical ideas, and seemingly a few other words, expressing other objects of Roman culture. Here was a second Roman infusion into our Teutonic speech. It was an infusion far greater than the handful of Latin words which we picked up in the course of the first conquest; but it was still an infusion which in no way affected the purity of our native vocabulary. Some foreign things kept their foreign names; but no native thing changed its native name for a foreign one. The effect on language was in short much the same as the effect on law. There was no break, no change; only certain new elements were adopted and assimilated by the old.

Effect on literature.

But if the conversion wrought but little change in the English tongue, it breathed a new literary life into the English people. The missionaries brought with them the whole learning of their time, and above all, the use of the Latin language. Latin, it must be remembered, was still not merely the literary tongue, but the common every-day speech of Western Europe. The dialects which grew into the Romance languages had doubtless already begun to form themselves; but no one looked on them as anything but vulgar dialects of Latin; no one thought of committing them to writing, or of using them for any serious purpose. A people who knew no Latin were cut off from all intercourse with the civilized world of the West; a people among whom Latin was cultivated at once formed part of that world. From the coming of Augustine, "book Latin" again took its place among the languages of Britain.[1] But happily it always remained "book Latin." It never displaced the native Teutonic speech on the lips of men; it never even shut out the native speech from the rank of a cultivated language possessing a written literature. Or rather, the general intellectual impulse which followed on the conversion, while it first gave us a Latin literature, also first made our English written literature. We learned to use a more convenient alphabet than the runes, a more convenient writing material than the beech. English was, what the Romance languages were not as yet, so far apart from Latin that the two languages, the two literatures, could live side by side. One point only is to be regretted. It is at once the strength and the weakness of the Latin Church, and one of her points of contrast with the churches of the East, that, wherever her system is accepted in its fulness she imposes the tongue of Rome as the one tongue of religious worship. Like crowds of other laws and usages, good and bad, this usage came about of itself, without any set purpose; it was only when it was objected to in after times that arguments were sought for to defend it. It was in England that the practice began of having divine service in a tongue not understanded of the people. That is to say, England was the first country of wholly foreign speech which the Roman Church had to deal with. It had not come into any man's head to translate the mass or the lectionary into the dialects of Gaul or Spain. Indeed we may be sure that the time for such a step was not yet come; the ecclesiastical Latin was doubtless at least as intelligible then as the English of the sixteenth century is now. Thus men who were accustomed only to Latin in public worship went on using it, even in a country where the same reasons which pleaded for the use of Latin at Rome pleaded no less strongly for the use of English. But this was the only error; the native tongue was in no way discouraged as the tongue either of devotional writ or of translations or paraphrases of Scripture. A noble Christian literature soon grew up in the English tongue. The only thing to be lamented is that its growth must have put the older heathen literature under a cloud. The songs which record the English conquest live only in Latin fragments, and Beowulf himself has been taught to utter Christian phrases, if only with stammering lips.

Use of Latin in divine service.

Cædmon and Bæda.

The two ends of England contributed to the growth of the new English literature. Our Christian English poetry is of Deira; our English prose is of Wessex; our Latin literature, our earliest history in literary shape, is of Bernicia. Cædmon of Streoneshalh led the way, the first of our English sacred poets, he who, a thousand years before Milton, dealt with Milton's theme in Milton's spirit—he who sang the warfare of Hebrew patriarchs with the true ring of a Teutonic battle-song. Next came Bæda of Jarrow, the first who recorded English history in Latin prose, and who, amid a crowd of Latin writings, did not forget the rendering of the gospel into the tongue of his own people. For Cædmon there might have been a place in the older state of things; for Bæda there could have been none. Cædmon, born while parts of England were still heathen, might have been a heathen born; he might, in the selfsame spirit, with little more than the change of names, have sung of Woden and Loki instead of Christ and Satan; he might have told the tale of Ida warring with the Briton instead of the tale of Abraham warring with the kings of Canaan. But Bæda is the direct offspring of the great religious change. The monk, the student, who never struck a blow in battle or raised his voice in the assembly of shire or kingdom, was a new character among Englishmen. Yet Bæda is English too; he is no stranger to us; he is the man of our own race, as the man of our race might now become under a state of things so far removed from the thoughts of the olden time. Of English prose, though in a sense it begins with Bæda, the true and full growth is later. Its founder is the king who was at once the judge, the captain, and the teacher of his people, West-Saxon Ælfred himself.

Effects on art.

We may also safely say that it was with the conversion to Christianity that the first rudiments of art were brought back into Britain. As heathen Rome taught her culture to the Briton, so Christian Rome taught her culture to the Englishman. How far the monuments of Roman skill were designedly swept away it might be hard to say. Most likely there was no design in the matter. Much would perish in the ordinary course of barbarian havoc, and there was no English Theodoric to guard what escaped. It is a speaking fact that a Roman column standing in its place is a thing unknown in Britain. We may be sure that the art of stone building was unknown to the heathen English in their old homes; nor was there anything in the circumstances of their settlement in their new homes to lead their thoughts in that direction. Architecture, and with it the other arts, painting, music, and the rest, came in again in the wake of the Church. Churches were built in the style which was then usual in Italy, churches of brick or stone with round arches. Sometimes a Roman ruin was still able to be repaired; more commonly it supplied materials for a new building. When the tall bell-towers came into fashion in Italy, they were imitated in England also. Thus arose, in England as elsewhere, that early round-arched style, based directly on Italian models, which formed the usual style of all western Europe till the eleventh century. The art of those days was mainly ecclesiastical. Houses were commonly, most likely always, of wood till the coming of the Normans. The Roman military works seem hardly to have been imitated till the great æra of fortification in the tenth century.

Introduction of monasticism.

With the new religion the land received a wholly new class of mankind, utterly unknown to the heathen Teutons, the class of men and women devoted to the religious life. Monasticism forms a marked feature in some pagan systems; but it had no place in the old Teutonic religion. We had not so much as anything that answered to the virgins of Vesta.

---

[1] The Chronicles at the very beginning say, "Her synd on þam iglande fif geþeódu—Ænglisc, Brytwylsc, Scottysc, Pihttisc, and Boclæden." This translates Bæda's list, "Anglorum videlicet, Brittonum, Scottorum, Pictorum, et Latinorum, quæ meditatione scripturarum cæteris omnibus est facta communis."

But Teutonic monasticism took a character of its own. Monasteries became private inheritances; the distinction was not always very accurately drawn between the ordained monk and the secular priest, between the unordained monk and the layman. Celibacy was doubtless essential to the very laxest form of the monastic life; but we shall look in vain in the early monasteries of England for any very strict observance of the rule of Saint Benedict. There was room however in them alike for the ascetic scholarship of Bæda and for the ruder zeal which led a crowd of men and women of all ranks, among them kings' daughters and even reigning kings, to forsake the world to embrace the religious life. A large proportion of the native saints of the English calendar were supplied by those kingly houses whose pride had once been to be sprung of the blood of the gods of heathendom.

Effects on the doctrine of kingship.

This last idea had of course wholly to change its shape under the influence of the new faith. The pedigree was not forgotten; Woden was still the forefather of all the kingly houses. But Woden was now found out to have been a mere mortal hero, the descendant of Noah in such and such a generation. We may suspect that one effect of Christianity was to lessen the reverence for the kingly stock as such, to strengthen the elective element, and to make it easier to choose kings who were not of kingly descent. The analogy alike of the Roman emperors and of ecclesiastical officers of all kinds would work the same way. But kingship, as an office, was in Christian hands clothed with a higher majesty, and became an object of deeper reverence. If one form of sanctity was taken away from the son of Woden, he gradually obtained another in his new character of the Lord's Anointed. At least from the eighth century, perhaps from an earlier time, English kings began, as the emperors had long been, to be admitted to their office with ecclesiastical ceremonies, among which the rite of unction held the chief place. The king thus became in some measure a sharer in the sanctity of the priesthood. He was clothed in sacred vestments, and enjoyed sacred privileges beyond the laymen of ordinary degree. But this only brought out more strongly his position as holding an office according to law. The priest, the abbot, the bishop, was chosen and admitted to his office according to a known law. According to the same law, he might, in case of demerit, be deposed from his office. So it was with the kingly office. The greater the mysterious sanctity that was shed over the kingly office, the more was his person shorn of all mysterious sanctity. He held a sacred office; but that sacred office might, like any other office, be taken away from an unworthy holder. On the other hand, the growing practice of personal commendation stepped in to restore the balance, and to strengthen the king's personal authority. He became the personal lord of all the chief men in his kingdom. They were bound to him by a voluntary tie of personal faith and honor. But these two growing notions, which made the king, on the one hand a personal lord, on the other hand an ecclesiastical officer, worked together somewhat to wipe out the older idea of the king as the head of the people, the chief, the judge and captain of the community, commanding obedience directly as the head of the state, without any need either of religious consecration or of personal allegiance.

The nation formed by the Church.

But if the new religion thus modified the older ideas of kingship, and tended on the whole to strengthen the kingly power, it affected the national being of the English people in a yet more direct way. In fact, it created that national being. Hitherto there had been no tie to bind together the various Teutonic kingdoms in Britain, except the precarious and fluctuating tie of the Bretwaldadom. Had the Bretwaldadom been permanent, it might have gradually fused all the Teutonic settlements into one nation. In the form which it actually took, it was a mere momentary superiority of one kingdom over others, which was naturally irksome, and was thrown off as soon as might be. The Church sowed the seeds of a truer national unity by accustoming Englishmen from different kingdoms to act together, and to acknowledge a common head. England had national synods long before she had national parliaments. Her kingdoms acknowledged a common primate long before they acknowledged a common king. The original scheme of Gregory would have divided Britain into two ecclesiastical provinces of much the same extent. York was to have taken in all Scotland; but the claim of York to ecclesiastical jurisdiction over Scotland was always precarious, commonly nominal, and it was in the end formally abolished. The regular succession of archbishops of York began later than that of Canterbury, and the northern primate, sometimes with one or two suffragans, sometimes with none at all, never practically held the same metropolitan position as the archbishop of Canterbury. This last became, long before any king could so call himself, the "head of Anglekin,"[1] the chief of the English nation, irrespective of political divisions. And such an influence was purely national. It gave no political importance to the secondary, soon to become the dependent, kingdom of Kent. It worked however when Kent had been merged in Wessex, to help the advance of Wessex, and to settle the general headship of England in the south. And, in the same way, the position of the see of York, which in practice was not so much an archbishopric as a great and powerful independent bishopric, doubtless did much to strengthen the general tendency of Northumberland to keep up a being distinct from that of southern England.

The two ecclesiastical provinces.

Wars no longer wars of extermination.

Rivalry of the English kingdoms.

Western advance of Wessex.

Thus, before the end of the seventh century, Teutonic and heathen England had embraced a new creed, and with that creed it had received those changes in thought, law, and custom which could not fail to follow on such a conversion. One change above all affects the general history. Warfare still goes on, warfare alike with the Britons and with Englishmen of other kingdoms; but warfare no longer implies extermination. Where the heathen conqueror carried mere slaughter and havoc, the Christian conqueror was satisfied with political subjection. The overthrow of Deva by Æthelfrith may well have been the last case of mere destruction. The greatness and fall of Penda form part of the history of the conversion; his reign was the armed resistance of heathendom to the new faith. His alliance with Cædwalla gave the Briton his last chance of greatness at the cost of the Teutonic intruder. When Cædwalla and Penda had both fallen before the sword of the Northumbrian Bretwaldas, two questions were solved. The Teuton and not the Celt was to be dominant in southern Britain; but the rule of the Teuton was to be a Christian and not a heathen rule. But a third question, which of the Teutonic powers in Britain should become the head of Britain, was still undecided. This question took more than a hundred years to settle, and it was at last settled in a way which was hardly to be looked for. During the greater part of the seventh and eighth centuries the struggle seemed to lie wholly between Northumberland and Mercia. Wessex seems to have given up all her schemes of aggrandizement in central Britain. She gradually loses her dominion north of the Thames; it is sometimes more than she can do to maintain her own independence against Mercian supremacy. But all the while she is gradually extending her dominion at the expense of the Britons to the west. She is also, in the latter part of the period, establishing a supremacy over the smaller English kingdoms to the east. The Wessex of 800 A.D. was a state of a wholly different shape on the map from the Wessex of 600 A.D. The West-Saxon kings, from the seventh century onwards, ruled over a realm of quite a different character from any of the earlier English kingdoms. Their western conquests, from the northern Axe to the Tamar, made them, now that the days of mere slaughter and havoc were passed, masters of a realm which contained British as well as English subjects. In the laws of Ine (675–693) we find the picture of a land in which the Britons are under the full protection of the law, but in which they form a distinct class marked as inferior to the dominant English. The Welshman's oath and the Welshman's life both have their value; but they are rated at a less value than the oath and the life of an Englishman of the same rank. When we turn to the laws of Ælfred (878–901), no trace of any such distinction is left. He legislates for a purely English realm. That is to say, the Welsh within the West-Saxon kingdom had, in the course of those two hundred years, become naturalized Englishmen. The impassable barrier of creed which divided the Christian Briton from the heathen Teuton had now passed away. There was nothing to hinder the conquered, when once admitted to legal protection, from gradually adopting the tongue and manners of their conquerors.

---

[1] In the poem on the martyrdom of Ælfheah in the Chronicles. 1011, the archbishop is called—

"Se þe æi wæs heafod
Angelcynnes
And cristendomes."

Advance of Mercia.

The same work must have been going on along the Mercian frontier also; but here we have not the means of studying it in the same detail. During these hundred and fifty years the Mercian kings spread their dominion a long way westward of the boundary stream of the Severn. But we hear far more of them as warring, often as conquerors, against the English powers to the north and south of them.

Greatness of Northumberland.

But at the beginning of this period Northumberland still remains the greatest power of Britain. For a while after the death of Penda her supremacy was undoubted. Mercia then again became independent, and under Wulfhere (657–675) and his successor Æthelred (675–703), who died a monk, pressed far towards the dominion of southern as well as of central England. Meanwhile, Ecgfrith of Northumberland (670–685) was pressing on to the further north, as the West-Saxon kings were to the extreme west. Northumberland, it must be remembered, reached to the Forth; but to the west it was hemmed in by the British land which stretch to the Clyde. This last Ecgfrith incorporated with his dominions. Carlisle and its district, a land which was in after days to become English again, now became English for a moment, as well as the land to the west which was not to become English again. But Ecgfrith fell in a war with the Picts beyond the Forth, and the dominion of Northumberland died with him. The northern land still remained for a while the chief seat of learning and culture, the land of Cædmon and Bæda. But its political power fell with Ecgfrith. The stoutest Northumbrian kings of the eighth century could at most keep their own borders against the Mercian, or again win victories against the North Briton. Of the Bretwaldadom of the seventh century they had no hope. Towards the end of the eighth century Northumberland fell into a state of confusion and division, which made it an easy prey for any enemy.

Greatness of Mercia.

During the greater part of the eighth century everything looked as if the chief place in the island was destined for Mercia. Æthelbald (716–757), Offa (757–796), and Cenwulf (797–819), through three long reigns, taking in more than a century, kept up the might and glory of their kingdom. Meanwhile, in Wessex a series of valiant kings pressed westward against the Briton, and bore up against the Mercian. But to bear up was as much as they could do. The fight of Burford in 752, under the West-Saxon king Cuthred, secured the independence of Wessex; but it secured only her independence; her northern frontier was finally cut short by Offa. This last is the greatest name in Mercian history. Though none of these Mercian kings are enrolled on the list of Bretwaldas, yet the position of Offa was as great as that of any English king before the final union of the kingdoms. In one way it was higher than that of any of them. Offa held, not only a British, but a European position. Britain was now again threatened with annexation by a continental power. Charles the Great, not yet crowned Cæsar and Augustus, but already virtual lord of Rome, exercised an influence in British affairs such as no prince of the mainland had ever exercised since Honorius withdrew his legions. That Englishmen, the famous Alcuin (Ealhwine) at their head, held high places at his court and in his favor was simply part of the wise encouragement which he held out to learning and merit everywhere. But the great Frankish king exercised direct influence, if not supremacy, in several parts of our island. The Scots are, at least by his own annalist, counted among his homagers. Northumberland took back a king at his bidding. A banished West-Saxon prince learned in his school the art of founding empires. But with the great king of the Mercians Charles corresponded as an equal. War was once threatened, but only threatened, between the great potentates of the island and of the mainland. In the next reign Cenwulf found it needful to put it clearly on record that neither the bishop of Rome nor the emperor of Rome had any jurisdiction in his realm of Mercia. These dealings with the continental empire should be marked, both on their own account and because of the light which they throw on some later passages in British history.

Offa and Charles.

Supremacy of Wessex under Ecgberht.

Charles, lord of the western world of Rome, was not fated to become lord of the island world of Britain. But a nearer approach to that character than had yet fallen to any English prince was in store for the friend and pupil of the great emperor. West-Saxon Ecgberht went back from the Frankish court to do in Britain as nearly as he could what Charles had done in Germany and Gaul. He went back to become the eighth Bretwalda, and more than a Bretwalda. The day of Northumberland and the day of Mercia had passed; the day of Wessex had come. The single reign of Ecgberht (802–837) placed her for ever at the head of the powers of Britain. Immediate king only south of the Thames, Ecgberht stretched his overlordship to the Forth, and, what no Bretwalda had done before him, he handed on his dominion to his successors. But the dominion of Ecgberht must not be mistaken for a kingdom of all England. He was king of the West-Saxons; once only does he call himself King of the English. But the kingdoms of Kent, Sussex, and Essex were now, as the West-Saxon shires had once been, ruled by under-kings of the West-Saxon house. In Mercia, Northumberland, and East-Anglia native kings stilled reigned, but they held their crowns as the men of the West-Saxon overlord. And in neither was the West-Saxon supremacy a mere precarious dominion, like that of the earlier Bretwaldas. Both relations were steps towards more perfect incorporation; they were stages in the process by which Wessex grew into England.

England or *Saxony.*

The name of *England* is not yet found in any contemporary writer. It came into use in the course of the next century. In truth, the oldest name for the Teutonic part of Britain is not *England*, but *Saxony.* This is only what was to be looked for. The lands won by the Teutons would first receive a common name from the Celts of the island, and that name, according to their usage, would naturally be *Saxony.* The Teutonic settlers themselves would not give their country a common name till they had reached some degree of political unity; but when they gave it a name, that name was naturally *England.* England, in short, as a political unity, began to be formed in the ninth century; it received its name in the tenth. Now that the various English kingdoms are brought so closely together, we begin to feel the need of a geographical name which may take them all in. Some name is needed, some name was doubtless soon felt to be needed, to distinguish the English kingdoms now united under West-Saxon supremacy from the other parts of the island. The position of Ecgberht could not be so well described as by calling him king of the West-Saxons and lord of all England. Lord of all Britain he was not, though he came nearer to being so than any prince before him. West-Wales, if not actually incorporated, was brought into thorough dependence, and the princes of North-Wales—that is, Wales in the modern sense—were brought to acknowledge the West-Saxon supremacy. The Welsh of Strathclyde, the Picts, and the Scots, remained independent and untouched.

Thus, though a kingdom of England was not yet formed, the greatest of all steps had been taken towards forming it. But the work of Ecgberht had stood but for a little while when it seemed to be swept away for ever. Yet while it seemed to be swept away, it was in truth both quickened and strengthened by an event which forms one of the great landmarks in our story, an event which has no parallel since the first settlement of the English in Britain. The English conquest was in some sort wrought over again. Christian Britain was again attacked by heathen invaders, and a large part of it was again brought under heathen rule. The West-Saxon supremacy seemed to vanish away; the West-Saxon kingdom itself was for a moment overcome. But the blows which overcame kingdom and supremacy did in truth only enable Ecgberht's successors again to do Ecgberht's work more thoroughly.

Successors of Ecgberht.

The dominion of Ecgberht passed to his son Æthelwulf (837–858), and from him to four of his sons in succession, Æthelbald, Æthelberht, Æthelred (858–871), and the more famous Ælfred (871–900). This succession involves a constitutional point; for we hear of a will of Æthelwulf, confirmed by the Witan, by which the order in which his sons were to succeed to the crown was arranged beforehand. There is in this no formal surrender of the right of the nation to choose its king; for the confirmation by the Witan was equivalent to a conditional election in advance. But that the crown could be made the subject of bequest in any shape shows the growth of a whole crowd of ideas which had no place in the elder Teutonic system. We are, to say the least, on the way towards the doctrine that the leadership of men is not an office but a property. This is the first case of any attempt to settle the succession beforehand, and, as in most other cases afterwards, the attempt failed. The sons of Æthelwulf succeeded; but they did not succeed in the order marked out by their father's will. Another point which marks the increasing intercourse between England and the main land is the fact that Æthelwulf made the pilgrimage to Rome. More than one king had given up his crown, and had ended his days at Rome; but this is the first case of a reigning king thus absenting himself from his kingdom. On his return also he married a foreign wife, Judith the daughter of Charles the Bald. This is the first recorded case of the kind since the marriage of Æthelberht of Kent; and we shall find only one more in the whole line before the Norman Conquest. As long as England remained purely England, the mothers of English kings were Englishwomen.

Accession of Ælfred.

Another point with regard to the succession should be noticed. On the death of Æthelred, Ælfred succeeded, though Æthelred had children living. This is of course simply an instance of the general law of choosing from the royal house, but of choosing only one who was personally qualified to reign. Minors were therefore passed by, as a matter of course, in favor of a full-grown uncle or other kinsman. The children thus shut out might or might not be chosen at some future vacancy. The right of Ælfred to his crown was not disputed in his own day, nor has he commonly been branded by later historians with the name of usurper. But it is well to bear in mind that his succession was of exactly the same kind as that of some later kings to whom the name of usurper has been freely applied. In all such cases the mistake comes from forgetting that the strict laws of succession to which we have been used for the last two or three centuries were altogether unknown in the earlier stages of our constitution.

The Danish invasions.

Movements of the Scandinavian nations.

Three stages of Danish invasion.

But the main history of England during these reigns, and indeed for a long time after, gathers round the successive Danish invasions. Christian England was now attacked by the heathen Danes, as Christian Britain had been attacked by the heathen English. But the results in the two cases were widely different. The Danes were not a people altogether foreign to the English; they were of kindred race, and spoke a kindred tongue. Had their inroads begun when the settlements of the Angles, Saxons, and Jutes were still new, they might have passed for a fourth branch of the same stock, come to share the spoil with their kinsfolk. As it was, their nearness in blood and speech made them disposed to accept a new religion at the hands of the English, and in the end to merge their own national being in that of the English, in a way in which the English themselves had been in no way disposed to do towards the wholly foreign races among whom they settled. The Danish invasions of England were part of a general movement which about this time began to carry the adventurous people of Scandinavia into all parts of Europe. Of the three great kingdoms into which they settled down about this time, Sweden had little to do with Western Europe; the advance of that power was to the east. But the people of Norway and Denmark ravaged everywhere, and settled in many places, along the coasts of Germany, Gaul, and the British islands. The Northmen founded powerful states, which have an occasional connection with English history, in Ireland, Orkney, and the Western Islands; but the Scandinavian settlements in England itself were almost wholly Danish in the stricter sense.[1] Their invasions fall naturally into three periods. There is first a time of mere plunder; secondly, a time of local settlement, when Danish dynasties are set up in certain parts of England; lastly, when England, Denmark, and other European powers had grown into something more of definite shape and order, we find an attempt, and for a while a successful attempt, to place a king of all Denmark on the throne of a kingdom of all England. Of these periods it is the first two only with which we are concerned at this stage, and these two have their exact parallels in the two stages of English invasion in Britain. The first recorded inroad of the Danes in any part of England is placed in Northumberland in 789; but it was not till the latter years of the reign of Ecgberht that their incursions became formidable, at least in southern England. They plundered both in Kent and in Wessex, and they leagued themselves with the West-Welsh to meet a common defeat at the hands of the Bretwalda.

Settlement between Ælfred and Guthrum.

The actual settlements did not begin till the reign of Æthelred. In 870 the Danes, after ravaging various parts of Northumberland and Mercia, and setting up a puppet king in Bernicia, occupied East-Anglia, whose king, the famous local saint Eadmund, died a martyr. Then came their first great invasion of Wessex, and the battles of the last days of Æthelred and the first days of Ælfred. Then (874–888) Northumberland and Mercia came altogether into the power of the Danes. For a moment they overran Wessex itself, and the realm of Ælfred was confined to the isle of Athelney. But the spirit of the great king never failed, and that of his people rose again. The Danes were driven from Wessex, and the peace of Wedmore settled the relations between the West-Saxon king and the Danes of East-Anglia. A line drawn from north-west to south-east divided Mercia into two parts. The south-western fell to the West-Saxon, the north-eastern to the Dane. The Danish king Guthrum embraced Christianity, and became a precarious and dangerous vassal of the West-Saxon overlord. His actual kingdom lay in East-Anglia; the chief power in Danish Mercia lay in the confederacy of the five boroughs, Lincoln, Leicester, Nottingham, Derby, and Stamford. In all these the Danish settlers seemed to have formed a patrician order, holding the English inhabitants in bondage. Deira, with York for its capital, formed a Danish kingdom. In Bernicia English princes still reigned under Danish overlordship. In a large part both of Northumberland and Mercia the land was divided among Danish owners, and not a few places received new Danish names. It might have seemed that the Danish conquest of more than half England was only less thorough than the English conquest of Britain itself.

Effects of the Danish settlement.

Changed position of Wessex.

But in truth the Danish occupation of northern and eastern England did but make ready the way for the more thorough incorporation of those lands with the West-Saxon kingdom. Ecgberht had established his supremacy over the English powers in those lands. But it was the supremacy of an external master. The Danish settlements gave the West-Saxon kings a wholly new character. Unless we reckon the tributary kingship of Bernicia, all the ancient English kingdoms, with their royal houses, were swept away wherever the Danes established their power. The West-Saxon kings remained the only champions of Christian faith and English nationality. They were now Kings of the English, and they alone. Mark also that, by the treaty between Ælfred and Guthrum, while the West-Saxon king lost as an overlord, he gained as an immediate sovereign. The actual West-Saxon dominion, as distinguished from mere West-Saxon supremacy, again reached far beyond the Thames. English Mercia was ruled under Ælfred by an ealdorman of the old royal stock, the husband of his daughter the renowned Æthelflæd. The Lord and Lady of the Mercians held a place intermediate between that of an under-king and an ordinary ealdorman. At the other end of Wessex, Kent and Sussex were completely incorporated, and ceased to be even distinct apanages. The West-Saxon supremacy was more fully established in Wales, and at last, in 893, even the Danes of the north acknowledged it. Ælfred had thus, in name at least, won back the overlordship of Ecgberht, combined with an enlarged immediate kingdom. As that immediate kingdom took in by far the greater part of Saxon England, and little or nothing that was not Saxon, he sometimes bears, neither the narrower style of King of the West-Saxons nor the wider style of King of the English, but the title, almost peculiar and specially appropriate to himself, of King of the Saxons.

---

[1] That there were in northern England Northmen, as distinguished from Danes, appears from the record of the commendation of 924 in the Winchester Chronicle. The name *Northmen*, at an earlier time, meant the Scandinavian nations generally; it is now specially used to mean the men of Norway. The Danes settled on the eastern coast of Northumberland and East-Anglia; the Northmen would seem to have made their way into western Yorkshire by way of Cumberland.

Second advance of Wessex.

Plate II.

The kingdom of England formed.

His overlordship over the heathen Danes was doubtless far less firmly established than Ecgberht's overlordship had been over their Christian predecessors. But now, in the eyes of the Christian inhabitants of Northumberland and Mercia, the West-Saxon king was no longer a stranger and a conqueror. He had become the champion of their race and faith against their heathen masters. In that character Ælfred himself hardly appeared. The last years of his reign were chiefly taken up in defending Wessex and English Mercia against new Danish invasions from without. But this Christian and English championship is the distinct characteristic of the kings who follow him, of his son Eadward the Unconquered (901–925), of his grandsons Æthelstan (925–940), Eadmund (940–946), and Eadred (946–955). Under them Wessex grew into England, and the overlordship grew into the empire of Britain. Eadward waged the war in partnership with his sister the Lady of the Mercians, who ruled alone after the death of her husband, and whose territory was on her death fully incorporated with Wessex. The son and the daughter of Ælfred gradually advanced their frontier, winning battles, fortifying towns, till Eadward, King of the English, held all England south of the Humber as his immediate realm. His overlordship was more fully admitted by the Welsh and the Northumbrians, and it was acknowledged for the first time by the Scots and the Strathclyde Welsh, who in 924 chose the English king as father and lord. Under Æthelstan Northumberland was incorporated, and the immediate realm of the one king of the English reached to the Forth. Still both he and his two successors had to fight against endless revolts and rival kings in Northumberland. The Danish land was won and lost and won back over and over again, till at last under Eadred Northumberland was finally incorporated, and ruled, sometimes by a single earl, sometimes by two, of the king's appointment. The kingdom of England was now formed.

The imperial claims.

The first half of the tenth century thus gave the West-Saxon kings a position in Britain such as no English kings of any kingdom had held before them. Dominant in their own island, claiming, and, whenever they could, exercising a supremacy over the other princes of the island, their position in the island world of Britain was analogous to the position of the Western emperors in continental Europe. It was in fact an imperial position. As such it was marked by the assumption of the imperial titles, *monarcha*, *imperator*, *basileus*, *Augustus*, and even *Cæsar*. These titles were meant at once to assert the imperial supremacy of the English kings within their own world, and to deny any supremacy over Britain on the part of either of the lords of the continental world. When we remember that some both of the Teutonic and Celtic princes of Britain had been the men of Charles the Great, the denial of all supremacy in the Cæsars of the mainland was not needless. Indeed that denial was formally made over and over again at various times down to the reign of Henry VIII.

Relations to Cumberland and Scotland.

On the other hand, we see during these reigns the beginning of the process which fixed the modern frontier of England to the north. The Picts and the Scots of Britain now formed what, as regarded their southern neighbors, was a single great kingdom north of Forth and Clyde. In the great fight of Brunanburh in 936 the Scots joined the Danes against Æthelstan, and shared in their defeat. After that time the relations of the Scottish kings to the English overlord seem for a long while to have been friendly. During this period the Scottish power began to make its way south of the two great firths. In 945 Eadmund conquered Cumberland. It might not be easy to say exactly what territory is meant by that name; but it was clearly the whole or a part of the ancient Strathclyde. It most likely took in Carlisle and its district, which had not been under direct English rule since the days of Ecgfrith. This territory Eadmund bestowed on Malcolm king of Scots, distinctly as a territorial fief. This is perhaps the earliest case of a grant of that kind in our history. It is something different from the commendation of either Scots or Britons to Eadward in 924. The northern kingdom of the Britons now became the ordinary apanage of the heirs of the Scottish crown. The Scottish royal house, if not the actual Scottish kingdom, thus obtained a great establishment south of the firth of Clyde, and soon afterwards the Scottish kings themselves made their way south of the Forth. In the reign of Eadred, Edinburgh, the border fortress of Northumberland to the north, became a Scottish possession. It is not clear on what terms this acquisition was made, or whether it was made in war or in peace. It is at least as likely, under the circumstances of the time, that it was a peaceful grant. But in any case it was the beginning of the process which brought the lands between Forth and Tweed into the possession of the Scottish kings, and which thereby turned them into English kings of a northern England, which was for a while more English than the southern England itself.

Legislation.

Growth of the kingly power.

Social changes.

The West-Saxon kings.

This period of war and conquest was also a period of legislation and intellectual advancement. In Ælfred we have the noblest name in all English history, the name of him who united more and more varied virtues than any other recorded ruler. The captain of his people, he was also their lawgiver and their teacher. His laws, the first that can be called a code, laws drawn up by himself and then submitted by him to the approval of his Witan, mark, as we have seen, when they are compared with those of Ine, a time when the distinction of Englishman and Briton had passed away from the West-Saxon kingdom. They are remarkable also for the great mass of scriptural and other religious matter which is brought in whole into their text. The laws of Eadward, of Æthelstan, and of Eadmund follow, and among them we have the text of the treaty between Ælfred and Guthrum, the earliest diplomatic instrument in our language. In all these laws we may trace the growth of the various new ideas which have been already spoken of as having gradually made their way into the older Teutonic system. The king grows greater and greater. Already a sacred, and fast becoming an imperial personage, he is something widely different from the old kings who ruled only over Wight or half of Kent. The increase of his dignity, the increase of the extent of his dominion, raise him at every step above the mass of his people. And as the kingdom grows, the right of the ordinary freemen to a place in the general assembly of the nation becomes more and more shadowy. That assembly shrinks more and more into an assembly of bishops, ealdormen, and king's thegns, made ever and anon more splendid by the appearance of vassal princes and kings. As the king grows in greatness, his immediate followers grow also. The old nobility of the earls is finally supplanted by the new nobility of the thegns. The result of this change is the general depression of the churls as a class, while it becomes easier for this or that churl to raise himself to thegn's rank. On the other hand, the lowest class of all begins to have its lot lightened. The spirit of Christianity, if it does not yet venture to preach the emancipation of the slave, brings in provisions which lessen the rigor of the ancient law. And we now find the first of a series of well-meant, though for the most part vain, attempts at least to hinder the slave from being sold out of his native land. Commerce and discovery are fostered. Thegn's rank is held out as a reward to the successful trader by sea. Intercourse with foreign countries becomes closer and closer. No foreign wife shares the throne of the *basileus* of Britain; but the sisters of glorious Æthelstan are given in marriage to the greatest princes of Western Europe. It was a great age for England, an age of great men and great events. The line of our hero kings, of Eadward the Unconquered, of Æthelstan the Glorious, and of Eadmund the Doer-of-great-deeds, is only less famous than it should be, because even their names must yield to the unequalled glory of their grandfather and father. Towards the end of the period we see, for the first time in English history, the person of a great minister, the wise counsellor of wise kings. Our first recorded statesman who was not a king is, as might be looked for in that age, a churchman, the great Dunstan, the guide of England through many stirring years of war and peace. The Church had made the English a nation; a great churchman was now foremost in making England a kingdom. A kingdom she now became, not yet indivisible, but still one. But one and strong and glorious as England stood in the central years of the tenth century, her unity and strength and glory were bought in no small degree by the loss of the ancient freedom of her people.

In literature this was a time which saw nothing short of the beginning of English prose.

Beginning of English prose.

For a long time, as we have seen, the special home of learning and culture in England was in the north. Wessex had her scholars, too, King Ine's kinsman Ealdhelm at their head; but the land of Bæda took the lead. In the confusions of the latter years of the eighth century the light of Northumbrian learning seems to have died out:

Writings of Ælfred.

yet even at the time of Ælfred's accession the great king places the greatest lack of learning south of the Thames. In the interval of peace between the wars at the beginning and the wars at the end of his reign, Ælfred largely devoted himself to wipe out this stain. He was himself the first English prose writer on a great scale; but his writings, in accordance with the modest and practical bent of his mind, were no displays of original genius, but translations, or rather paraphrases, of such Latin works, both on divine and on secular subjects, as he thought were fitted for the improvement of his people. But above anything that Ælfred wrote himself stands the really greatest literary work of his reign, the beginning of the English Chronicle as it now stands.

The English Chronicle.

The fragmentary chronicles of earlier times were put together; the history of Bæda and the records of other lands were pressed into the service; the work became contemporary in the minute and brilliant narrative of Ælfred's own reign. From his day it goes on, sometimes full, sometimes meagre, sometimes a dry record of names and dates, sometimes rising to the highest flight of the prose picture or of the heroic lay, but in one shape or another never failing us, till the pen dropped from the hand of the monk of Peterborough who recorded the coming of Henry of Anjou. We, and we alone among the nations of Western Europe, can read our own story from the beginning in our own tongue in which we were born. But it must be borne in mind that, as we go on, we shall find that the English Chronicle is not one chronicle but many. The record which began at the beginning of Ælfred was in the eleventh century continued in various monasteries, and the later parts of the several copies must be looked on, not as copies of a single work with some places where they differ, but as separate works which have some matter in common. The tale is told in different ways, with much difference of local feeling and even of political creed. The different chronicles stop at different periods. That of Peterborough, as we have hinted, stops suddenly in 1154.

England under Ælfred was a land where foreign merit was welcome, as under Charles the Great English merit had been welcome in other lands. The Briton Asser, the Old-Saxon John, the Frankish Grimbald, received at the West Saxon court the same reception which Ealhwine had met with at the hands of the mighty Frank. Learning now prospered; the monasteries were schools; but the native tongue flourished also. Of the wars of Eadward and Æthelflæd the Chronicle gives us a full military narrative; in the following reigns the prose entries are meagre, but we get in their stead the glorious lay of Brunanburh and the shorter song of the deliverance of the Five Boroughs.

Dunstan.

Towards the end of our present period, Dunstan, the great statesman, began to appear as an ecclesiastical reformer. His name is connected with the movement of the last half of the tenth century for enforcing a stricter discipline on the monasteries and for substituting monks for secular priests in many cathedral and other churches. The English clergy, even those who formed collegiate bodies, were fond of the separate and not uncommonly married, life of the secular priest. This supposed laxity now gave way in several episcopal churches to the strict Benedictine rule. Hence came the usage, almost but not quite peculiar to England, by which the bishop had, as his diocesan council and the ministers of his own special church, a body of men who had professedly renounced all the affairs of this world. That Dunstan shared in this movement there is no doubt. But it would be hard to show from real history that he was foremost in the movement; and it is far more certain that no merely ecclesiastical reform was the foremost object in Dunstan's policy. The unity and the greatness of England were the first objects of the statesman whom Glastonbury gave to England.

Under Eadred the unity of England was formed. On his death the newly-built fabric seemed to break in pieces. The days of the grandsons of Ælfred, like the days of his brothers, were days when brothers succeeded one another after short reigns, and died for the most part childless. When Eadred died, there was no other son of Eadward the Unconquered to succeed him; nor does there seem to have been in the more distant branches of the royal family any one likely to command the unanimous voice of the nation. For a man who, though of kingly descent, was not the son of a king to come forward as a candidate for the crown would hardly have been endured, except in the case of one who held a commanding personal position, such as was held by no man in the realm save the mighty churchman. England had therefore more than once during this age to risk the woes which are denounced against the land whose king is a child. And the realm so newly united risked the dangers not only of minority but of division. The young sons of Eadmund, passed by according to ordinary rule on the death of their father, succeeded, for want of better candidates, on the death of their uncle Eadred. The elder, Eadwig, received Wessex as his immediate kingdom; the younger, Eadgar, reigned over Northumberland and Mercia as under-king. The division was followed by a period, short, confused, and obscure, but of the highest importance both on its constitutional and on its ecclesiastical side. The facts which stand out without doubt are that Eadwig was the enemy of Dunstan and that Eadgar was his friend; that in 957 the kingdom of England was altogether divided by the Mercians and Northumbrians declaring their under-king Eadgar full king in his own right; that in 959 the kingdom was again united by the death of Eadwig and the succession of Eadgar to the whole realm.

Reign of Eadgar.

But the causes which immediately led to these events are told with every kind of contradiction; the characters of the actors are painted in the most opposite colors. It is clear however that with the accession of Eadgar the party of the monks triumphed. It is clear also that under Eadgar's rule the land enjoyed sixteen years of unparalleled peace and of unparalleled prosperity. During his reign no word of foreign invasion was breathed, and the two or three disturbances within the island were of slight consequence. The well-known picture of the *basileus* of Britain rowed by eight vassal kings on the Dee, even if some of its details may be legendary, at least sets before us the popular conception of the dominion of Eadgar the Peaceful. On the other hand, when we turn to the personal character of the two brothers, it is dangerous to accept, without the closest examination, either the crimes which the monks lay to the charge of Eadwig or the crimes which the gleemen lay to the charge of Eadgar. At no time in our early history did England hold a higher position in the world in general. And when Old-Saxon Otto wore the crown of Rome, and West-Saxon Eadgar, in some sort his nephew, reigned over the island empire of Britain, the Saxon name had reached the highest point of its glory.

The reign of Eadgar, there can be no doubt, did much for the unity of England. By birth a king of the south, he owed his crown to the men of the north. He strictly preserved the distinct laws and customs to which the great divisions of the kingdom, now beginning to be distinguished as West-Saxon, Mercian, and Danish, were severally attached. Commerce and intercourse with foreign countries is encouraged. The ecclesiastical reform led to increased splendor in ecclesiastical buildings, and the land was covered with minsters built on a scale before unknown. The kingdom thus built up and strengthened had presently to undergo the shock of a disputed election for the crown. Again the immediate royal family contained none but minors, the two sons of Eadgar, Eadward and Æthelred.

Reign of Eadward.

As far as we can see, Æthelred was supported by the party of the monks and Eadward by their enemies. Dunstan therefore distinctly sacrificed his party to his country when he brought about the election of Eadward, the elder of the boys, whose minority would therefore be the shorter. His short reign (975–979) was ended by his murder, done, there can be little doubt, at the bidding of his step-mother Ælfthryth, the Elfrida of romance.

Reign of Æthelred.

Her young son Æthelred then entered on the saddest and most shameful reign in our annals. His time of thirty-seven years (979–1016) forms the most marked contrast to the short and vigorous reigns of the heroes who opened the century. For the first nine years of this unhappy time, Dunstan still lived; he was taken away before the fulness of evil came. The main feature of this time is the renewal of the Danish invasions, which, after some years of mere plundering incursions, take their third form, that of a distinct political conquest, the establishment of a Danish king on the throne of all England. The constitutional lesson of this time is that, limited as the powers of an English king were by law, incapable as he was of doing any important act without the consent of his Witan, the difference between a good and a bad king was something which words cannot set forth. It was for the Witan to pass decrees; but it was for the king to put them in force; and under Æthelred nothing good ever was put in force. The unready king—that is the king without *rede* or counsel—seems to have been incapable of any settled or vigorous plan of action. He showed energy now and then in needless and fruitless enterprises; but under him the kingdom never showed a united front towards the common enemy. His only policy, the only policy of his cowardly or traitorous advisers, was the self-destroying policy of buying off the invaders with money. The invaders are met at London, at Malden, at Exeter, with the highest valor and conduct on the part of the leaders and people of particular cities and districts; but it is always isolated cities and districts which resist. Such local efforts were naturally fruitless; the local force is either defeated by superior numbers, or, if victorious, it has, through want of concert with other parts of the kingdom, no means of following up its victory. Through a warfare like this, carried on year after year, the nation at last lost heart as well as its king. Local jealousies, hushed under the vigorous rule of earlier kings, now rose again. It is emphatically said that one shire would not help another. Under such a reign the efforts of the best men in the land were thwarted, and the places of highest power fell to the worst men. The successive advisers of Æthelred appear as a succession of traitors, who sold him and his kingdom to the enemy. The last of them, Eadric, whom Æthelred made earl of the Mercians and married to one of his many daughters, plays the chief part in the revolution which in the end placed the Dane on the English throne.

Beginning of intercourse with Normandy.

The staple then of the history of this time is foreign warfare, and that mostly warfare which takes the shape of invasion of England. But this time is marked also by foreign intercourse of another kind, intercourse which may at the time have seemed of no great importance, but which helped, together with the Danish invasions, to lead the way to events greater even than the Danish conquest itself. English political intercourse with other lands had hitherto been mainly with the Franks in Germany and Gaul, and with their successors in Germany, the Saxon emperors. In the course of the tenth century, the new powers of France and Normandy had sprung up in what had been the western or Gaulish part of the Frankish dominion. The king of the French at Paris was cut off from the sea by his vassal the duke of the Normans at Rouen. While Normandy was a practically independent state, there could be hardly any dealings, in war or in peace, between England and France. But it was through its connection with Normandy that England became entangled in the affairs of France, and the connection between England and Normandy begins under Æthelred. England and France might doubtless in the end have become rival powers in some other way; but the way in which they actually did become rival powers was through a chain of events of which we have now reached the beginning. Two quarrels between Ælthelred and the Norman duke Richard were ended by a peace and a marriage (1002) between Æthelred and Richard's daughter Emma. Here was the beginning of the causes which led to the Norman conquest. Emma brought with her Norman followers, some of whom were trusted with commands in England. The kindred between the ruling families of the two lands which came of the marriage of Emma led to increased intercourse between Normandy and England, to Norman interference with English affairs, to the settlement of Normans in England, to the claims of Duke William and to the Norman Conquest. When Normandy and England were under a common sovereign, France became in some sort a neighbor and an enemy of England. The rivalry between Normandy and France led to a rivalry between England and France, and that rivalry went on after France had swallowed up Normandy. Thus not only the Norman Conquest, and the internal changes which followed it, but the French wars of the fourteenth and fifteenth centuries, and the long abiding enmity between Englishmen and Frenchmen, have their direct source in the events of the reign of Æthelred.

Marriage of Æthelred and Emma.

Death of Brihtnoth.

This last series of Danish invasions began, in the form of mere plundering incursions, in 980. In 991 a formidable invasion, Norwegian rather than Danish, and in which the famous Norwegian king Olaf Tryggvesson seems to have had a share, was marked by two opposite events, each alike characteristic of the time. Brihtnoth, the ealdorman of the East-Saxons, died with his thegns around him in the fight of Maldon, and his fall is recorded in one of the noblest of Teutonic battle-songs. Æthelred's earl, as he calls himself in the song, met the invaders with steel; but Æthelred himself had no arms but gold. The year of Brihtnoth's death was the very one in which the invaders were for the first time bought off with money. In 994 came a great joint invasion under the two kings of the north, Olaf of Norway and Swegen of Denmark. They were beaten off by the Londoners. Æthelred again bought peace; Olaf, converted to Christianity, kept the peace and vanishes from the story; but the war went on, if not with Swegen himself, at least with his Danes. After eight years of invasions, payments, brave local resistance, and inaction and treason at head-quarters, came the general massacre of the Danes in England on the day of Saint Brice in 1002. This of course does not mean the slaughter of all the men of Danish descent in England, but simply the slaughter of those men of the invading host who had stayed in England, under cover of a treaty. Then came in 1003 a more terrible invasion by Swegen in person, when Exeter was betrayed to him by a Norman follower of the queen's. A valiant resistance in East Anglia checked the invasion at the time, and Swegen himself did not appear again for some years. In the next stage, in 1006, the Danes first ravaged the inland part of Wessex. In 1010 comes the invasion of Thurkill; and the battle of Ringmere near Ipswich marks the last armed resistance. In 1013 Swegen came again. All strength and all hope was now gone; Æthelred was deposed, and took refuge in Normandy, and the Danish king was acknowledged as king—though native writers choose rather to call him tyrant—over all England.

Massacre of Saint Brice.

Swegen acknowledged king.

This Danish conquest of England, taking the form of a forced election of the conqueror, is something widely different alike from mere plundering incursions and from mere local settlements. It shows that we have got into the age of great powers. The king of an established kingdom adds another crown to the one which he has already, and strives to give his conquest an outward show of legality. Swegen's conquest is in this way almost a literal foreshadowing of the more famous conquest of William. But Swegen's conquest was only for a moment; he died the next year; his Danish host chose his younger son Cnut as his successor; the English Witan voted the restoration of Æthelred. In Denmark, it must carefully be marked, Swegen was succeeded by his elder son Harold. Cnut was chosen king over England only. A Danish dynasty was to reign in England; it was not yet ruled that Denmark and England were to have a single king. The war was now renewed between Cnut and Eadmund, surnamed Ironside, one of the younger sons of Æthelred. Englishmen had again a hero at their head, and, under his guidance, the whole state of affairs was changed. In the midst of this second war, in 1016, Æthelred died. A double election took place; Cnut and Eadmund were chosen to succeed by two distinct bodies of the English Witan. Eadmund, it would seem, was chosen, at such a moment, over the head and with the consent of his elder brother Æthelstan.[1] A series of battles followed, in which Eadmund had decidedly the upper hand, till the last fight at Assandún, that is, Ashington in Essex, was lost by the treason of Eadric. The kingdom was divided; Eadmund took the south with a formal supremacy; Cnut took the north. The division was hardly made when Eadmund died mysteriously, by the practice of Eadric, as men deemed. And now another and final election gave Cnut the crown of the whole realm.

First election of Cnut.

---

[1] This is merely a probability, not an ascertained fact; but several circumstances point to such a supposition, there is nothing to contradict it, and it would explain several difficulties. See *History of the Norman Conquest*, i. 691, ed. 3.

Reign and character of Cnut.

His dominions.

Relations with Scotland.

The personal character of Cnut, his gradual change from a barbarian conqueror into a king who stood beside Ælfred in the memory of his people, makes him one of the most interesting studies in our whole history. But we have here to deal mainly with the political results of his accession. England was now brought more closely than ever into relations with other parts of the world. But those relations took a shape which was altogether new and unexpected. Cnut was a conqueror, and his establishment in England was a conquest, so far as that a foreign king made his way to the English crown at the sword's point. And, when he had worn the crown, he did not scruple to secure it by the death or banishment of such Englishmen as he thought dangerous to him, either on account of their connection with the former royal house or on any other ground. But, when he had once made himself safe on the throne, there was nothing more of the conqueror about him. England was neither oppressed nor degraded under his rule. His government, his laws, were framed after the pattern of those of the ancient kings. He sent home his Danish army, keeping only a body of chosen guards, the famous housecarls. These were the first standing army known in England, a body of picked men, Danes, Englishmen, or brave men from any quarter. Cnut gradually displaced the Danes whom he had at first placed in high offices, and gave them English successors. He raised an Englishman, the renowned Godwine, to a place second only to kingship, with the new title of Earl of the West-Saxons. In her foreign relations, England, under her Danish king, was in no sense a dependency of Denmark. England was the centre, Winchester was the imperial city, of a northern empire, which rivalled those of the East and the West. Cnut, it must be remembered, was chosen to the crown of England first of all, while still very young. To that crown he added the crown of Denmark, on the death or deposition of his brother Harold. He won Norway, which had revolted against his father, from its king Olaf; and he seems to have established his power over part of Sweden and other parts of the Baltic lands. But all these were acquisitions made by one who was already "King of all England;"[1] they were largely won by English valor, and the complaint in Denmark and elsewhere was that Cnut made his northern kingdoms subordinate to England, and preferred Englishmen rather than natives to high offices in them. At home, after the first years of his reign, his rule was one of perfect peace. In 1018 a Scottish victory at Carham secured all Lothian to the Scottish king. This was the carrying out of the work which had been begun by the Scottish annexation of Edinburgh. Whether there had been an earlier grant, or an earlier conquest, of Lothian is uncertain. Of its Scottish occupation from this time there is no doubt. But in 1031 Malcolm of Scotland, and two under-kings, the famous Macbeth and one described as Jehmarc, did full homage to the King of all England. The northern king thus held his dominions in three distinct forms. In Scotland proper he was simply under the terms of the old commendation. Cumberland, whatever extent of territory comes under that name, was strictly a territorial fief. Lothian was an earldom held within the kingdom of England.

Cnut's relation to the church.

The position of Cnut, both as a man and as a king, derives a special interest from his being a convert to Christianity. His father Swegen was an apostate. He had been baptized in his childhood or youth; but he cast aside his new faith, and carried war into England as a heathen conqueror. His son Cnut was baptized in the course of his English wars, and he appears in English history as a Christian king, a devout king, a special favorite of the Church and her ministers. His laws are strong on all ecclesiastical points, and they contain —what was needful in his day, but which had not been needful, in Wessex at least, for some ages—a crowd of provisions for the suppression of heathen worship. In Denmark he appears as completing the conversion of that kingdom which had already begun. His newly-born religious zeal led him, like Æthelwulf, to make the pilgrimage to Rome. His reception there by the pope, the emperor, and the Burgundian king, helped to raise the position of England and her sovereign in foreign eyes; but it had no other political result.

Cnut's earls.

One change, the fruit of which was chiefly seen a little later, was made by Cnut in the administration of the kingdom. As far as we can see, the rule had hitherto been for each shire to have its own ealdorman. One ealdorman sometimes held several shires, and the arrangement, at any rate under Æthelred, was confused and fluctuating; under Cnut it was organized in a new shape. Four great chiefs were set over the four great divisions of the kingdom, Wessex, East-Anglia, Mercia, and Northumberland. The Danish title *Jarl* or *Earl*, hitherto used only in Northumberland, was now substituted for ealdorman. We find also smaller earls of one or more shires; but it is plain that these were subordinate to these great governors. Wessex, above all, received now for the first time, in the person of Godwine, a governor distinct from her king.

Relations with Normandy.

The relations between England and Normandy now get closer and more important. Æthelred had found shelter in the Norman court with his brother-in-law Duke Richard. The young Æthelings, Ælfred and Eadward, the sons of Æthelred and Emma, were brought up at the court of their uncle. But, strange to say, their mother Emma entered into a second marriage with Cnut himself, who must have been many years younger than she was. With Richard of Normandy Cnut kept unbroken peace; but Richard's more adventurous son Robert asserted the rights of his cousins and threatened—perhaps attempted—an invasion of England on their behalf. Robert presently died on his famous pilgrimage. In the same year (1035), Cnut himself died, still in the prime of life, after a reign of only eighteen years from his final election.

Division of Cnut's empire.

Such a dominion as the northern empire of Cnut was in its own nature ephemeral. Such a power can hardly endure beyond the life of its founder. The dominions of Charles the Great, geographically continuous and bound together both by Roman and by Frankish traditions, could not be kept under one ruler. Much less could the scattered empire of great islands and peninsulas which Cnut had brought under his power. Not only did his empire break in pieces, but his kingdom of England was again, for the last time, divided. Of his empire he himself had decreed the partition. He had in some sort begun it in his lifetime. His sons had been sent to reign as under-kings in Denmark and Norway. As his successor in England he named Harthacnut, his son by Emma, who at his death was under-king in Denmark. But the succession to the English crown was disputed. Godwine and the West-Saxons asserted the claims of Harthacnut, according to his father's will. Mercia and Northumberland declared for Cnut's doubtful or illegitimate son Harold. A civil war might have been looked for; but a decree of the Witan divided the kingdom between the two candidates. Harthacnut, now king of the West-Saxons, tarried in Denmark, and left his English kingdom to the care of Emma and Godwine. Now, and not under Cnut, the West-Saxon realm seemed to be dealt with as a province of Denmark. The offended subjects of Harthacnut voted the deposition of their non-resident king, and the crown of the whole realm passed to Harold. Since that day England has been a united kingdom. Its crown has often been disputed and struggled for in arms; but every claimant has been a claimant of the whole kingdom. The division of England between two kings has never been seriously proposed since the deposition of Harthacnut. The very thought of such a thing had altogether passed out of men's minds before the end of the century with which we are now dealing.

Reigns of Cnut's sons.

The divided reign of Harold and Harthacnut was marked by an event which is told in as many and as contradictory shapes as any event in our early history. But it is certain that Ælfred, the elder of the two Æthelings who were living in banishment in Normandy, came over to England to make an attempt on the crown. The case is an exact parallel to the coming of the two Stuart pretenders seven hundred years later. As Ælfred landed on the south coast, his immediate design must have been on the kingdom of Harthacnut; but he came, in some way or other, into the power of Harold. His Norman companions were put to cruel deaths; the Ætheling himself was blinded, and died soon after. Such dealings are quite contrary to either the English or the Norman practice of the age. It shows that the son of Cnut, unlike his father, retained the full spirit of a Scandinavian pirate. That Earl Godwine had a share in the crime was rumored in his own day; but, as the tale is commonly told, it is absolutely impossible. If his guilt was asserted by some, it was carefully denied by others; he was tried on the charge, and was solemnly acquitted; and, in the state of our evidence on the subject, he is entitled to the benefit of that acquittal. The reign of Harold was short. On his death in 1040, Harthacnut was chosen to the whole kingdom. A son of Emma, therefore a half brother of the surviving Ætheling Eadward, he sent for that prince to his court. But Harthacnut proved as worthless and brutal as Harold, and his reign, like Harold's, was short. On his death in 1042, the English nation were thoroughly tired of Danish rule. The memory of Cnut could not outweigh the infamy of his two sons. There was still a Danish party, whose candidate was Swegen, the nephew of Cnut through his sister Estrith, a prince who afterwards ruled Denmark with consummate prudence. But the English people had made up their minds to go back to the old kingly stock of the West-Saxons. In two distinct elections the nation chose the Ætheling Eadward, an unwilling candidate, recommended by his birth. But at such a moment English and kingly birth outweighed every other consideration. It should be also remarked that Eadward, like so many other kings, was chosen over the head of a nephew, who, according to modern ideas, was the direct heir. This was another Eadward, the son of his elder brother Eadmund Ironside. But he was far away in Hungary and none thought of him.

---

[1] Up to this time the title is always "King of the English," never "King of England." Cnut uses the special style of "King of all England," "Rex totius Angliæ." This is not strictly a territorial style; still less is it the style of a conqueror. The object is to distinguish his kingship over all England from his earlier divided kingship when the land was parted between him and Eadmund.

Eadward the Confessor.

The election of Eadward was in some sort the beginning of the Norman Conquest. The English nation had chosen Eadward, who seemed an Englishman, rather than Swegen, who seemed a foreigner. But Eadward was in truth far more of a foreigner than Swegen. Born in England, but taken to Normandy in his childhood, he was in speech and feeling far more Norman than English. His monastic virtues won him the reputation of a saint and the title of Confessor, but no man could have been less fitted to wear the crown of England in such an age. His reign falls into two parts. Elected mainly by the influence of Godwine, Eadward married his benefactor's daughter, and raised his sons to earldoms. But the greatness of the West-Saxon earls was looked on with more or less jealousy by central and northern England, or at least by the earls who ruled over them. According to the division of Cnut, Northumberland was ruled by the Danish Siward, Mercia by Leofric, seemingly a descendant of the ancient kings of Mercia. Leofric himself was, as a party leader, eminently moderate and conciliatory: but the rivalry between his house and the house of Godwine formed a marked feature in the reign.

Banishment of Godwine.

Meanwhile the king himself filled every place that he could with Norman favorites, who plotted against Englishmen of every district and party. Above all, the king was under the influence of the Norman Robert, a monk of Jumiéges, whom he raised successively to the bishopric of London and the archbishopric of Canterbury. The influence of strangers was now at its height; so was their insolence. Against the king's foreign favorites no justice could be had. Godwine and his sons took up arms in the cause of the nation (1051). He was induced to abide by the decision of a national assembly, by which he and his sons were banished. The power of the strangers now seemed secure. William duke of the Normans, a kinsman of Eadward through his mother, visited Eadward; and it was most likely now that Eadward made to him that promise of the succession to the crown on which William afterwards founded his claim to succeed him. It seemed as if the Norman conquest of England had been already brought about without slash or blow. The king was Norman in feeling; he was surrounded by Norman courtiers; Normans and other men of French speech held high offices and great estates. The peaceful succession of the Norman duke to the English crown seemed far from unlikely. But all this was only on the surface. It is needless to show that a king of the English had no right to bequeath his crown. The utmost that he could do was to recommend a candidate to the Witan, and their choice was, under all ordinary circumstances, confined to the royal house. William himself might doubtless see through all this; but his kindred to Eadward, the bequest of Eadward in his favor, worthless as either was in point of English law, were advantages which he well knew how to turn to his own purposes.

Schemes of William of Normandy.

A peaceful conquest of this kind, had such a thing been possible, would have been an unmixed evil. When the actual Norman Conquest came, its final results were on the whole for good. But that was because the violent overthrow of our national freedom did in effect breathe a new life into the nation. It called forth the spirit of Englishmen, and step by step we won back more than we had lost. But had the Normanizing schemes of the Confessor been carried out, the ancient freedom would have been undermined rather than overthrown; there would have been less to call forth the full strength of antagonistic feelings, and England might, without knowing it, have sunk to the level of continental states. It is therefore not only in the patriotic view of the moment, but in the longest-sighted view of general history, that we set down the return of Godwine and his sons in the year after their banishment as one of the great events of our history.

Return of Godwine.

They came in arms; but the nation received them with all gladness, and the army which the king had brought together refused to fight against the deliverers. The restoration of Godwine and his sons, and the banishment of the archbishop and of a crowd of other Normans, was decreed in a national assembly which was one of the most memorable in English history. The old Teutonic constitution revived. At such a moment the Witenagemót ceased to be a mere gathering of the chief men of the realm. The nation itself came together. Such a name may fairly be given to an assembly made up of the citizens of London and of the two armies which had refused to fight against one another. This is the most conspicuous among several instances which show that, narrow as the constitution of the national assembly had become in ordinary practice, the rights of the common freemen were only dormant, and could still be made good whenever circumstances were favorable for making them good. It should be noticed also that this armed assembly of the nation took upon itself to depose an archbishop, and seemingly to nominate his successor. So to do was, there can be no doubt, fully within the powers of an English national assembly. But the breach of all ecclesiastical rule, as ecclesiastical rule was understood on the continent, was turned by Norman cunning into another count against England and her deliverers.

Administration of Harold.

Godwine died the year after his return, and his place in the kingdom was taken by his son Harold. His policy was one of conciliation. The king was allowed to keep his personal favorites about him; but the Norman influence in public affairs was stopped. On the other hand, Harold cultivated the friendship of Germany, and many Lotharingian churchmen were promoted in England. The Welsh were now again formidable, having been united under a vigorous prince named Gruffydd ap Llywelyn. After some victories over other English commanders, the Britons were at last brought to more complete dependence by Harold himself, in a war in which Gruffydd was killed by his own people. Earlier than this, the Northumbrian earl Siward had overcome Macbeth, and had restored the Scottish crown to Malcolm, the heir of the former kings.

England thus, under the administration of Harold, held a high place at home and abroad. Still there were several sources of weakness, all of which the Norman knew how to make use of. When the Norman archbishop Robert was deposed and banished, his English successor Stigand was looked on at Rome as an usurper of the see. In the early years of Eadward, Roman influence had greatly grown in England, and the canonical scruple about Stigand's appointment was shared by many at home. And when at last Harold procured the acknowledgment of Stigand from Pope Benedict X., matters were only made worse; for Benedict himself was presently declared to be an usurper. It was of more importance still that Harold himself was alleged to have entered into some personal engagements with Duke William. The tale, which comes to us only from the Norman writers, is told with so much contradiction that it is impossible to get at the exact truth. The Normans gave out that Harold was sent by Eadward to announce his bequest of

Harold's oath to William.

the crown to William, that he did homage to William, engaged to marry his daughter, and promised to promote his succession at Eadward's death and to give him immediate possession of the castle of Dover. This tale is altogether impossible; but it is very likely that Harold was shipwrecked on the shore of Ponthieu and imprisoned by its count Guy; that he was released by the interference of Duke William; that, in return for this favor, he helped him in his war with the Bretons; that he promised—though an older man than Duke William—to marry his daughter; and that he did an act of formal homage to his intended father-in-law and temporary military commander. Here is most likely the germ of the story, a story about which the contemporary English writers are significantly silent, while the Normans improve it into such forms as suited their own purposes. It is plain that the canonical question about Stigand, and the story of Harold's oath, gave every opportunity, when the time came, to represent the English as a sacrilegious and schismatic people, and their ruler as a man faithless to his oath.

Banishment of Tostig.

While these sources of danger were growing up abroad, a third source was growing up in England itself. The rivalry between the West-Saxon and the Mercian, between the house of Godwine and the house of Leofric, went on. The character of Leofric himself is without stain; but his son Ælfgar did not scruple to ally himself with the Welsh against England. Outlawed and restored, he held his father's earldom of Mercia till his death, when it passed to his son Eadwine. But, in the latter days of Eadward, all the rest of England was under the government of the sons of Godwine. Of these Tostig had succeeded Siward in Northumberland. He was a personal favorite of the king, and his appointment may well have been King Eadward's own act. In the last year of Eadward's reign the Northumbrians deposed Tostig, and chose as their earl Morkere, the brother of Eadwine. Rather than plunge the country into a civil war, Harold confirmed the choice of the Northumbrians. Tostig went into foreign lands to complain of his brother, and to plot against his country. Harold thus drew on himself the enmity of his brother, without winning the gratitude of the sons of Ælfgar.

Election of Harold.

Such were the three-fold dangers which threatened England when Eadward died, January 5, 1066, while the Witan were assembled at Westminster for the Christmas feast. Eadward was childless, and the question of the succession must have been in men's minds during the whole of his reign. That he promised the crown to William at the time of the duke's visit is, as we have seen, very likely. But such thoughts passed away under the administration of Harold. Eadward sent for his nephew Eadward from Hungary, clearly designing him as his successor. The younger Eadward came to England and died. He left two daughters, and a son Eadgar, young and of little promise, who was at Eadward's death the only male left in the royal family. In such a strait it was needful to look for a king beyond the royal family. Eadward on his death had recommended Harold to the choice of the electors, a recommendation which was willingly accepted. Harold was chosen and crowned, taking care to avoid any question as to the validity of the crowning rite, by having it performed, not by Stigand, but by Ealdred archbishop of York. The Northumbrians for a moment refused to acknowledge the election of the new king; but he won them over by his presence and the eloquence of his friend Wulfstan bishop of Worcester. It was most likely at the same time that he tried to win the northern earls to his side by a marriage with their sister Ealdgyth. This was a direct breach of his promise to William; and, as Ealdgyth was the widow of Gruffydd of Wales, this last fact was made a further charge against him by the Normans.

Its lawfulness.

Of the lawfulness of Harold's succession, according to the English law of the time, there can be no doubt. He was nominated by the late king, regularly chosen, regularly consecrated. The Witan had always exercised a free choice within the royal house, and the same principle would justify a choice beyond the royal house, when the royal house contained no qualified candidate. Minorities had been endured after the death of Eadred and after the death of Eadgar. But then the only man in the land who held at all the same position as Harold now did was the churchman Dunstan. In fact the claims of Eadgar do not seem to have been put forward at the time. They begin to be heard of at a later time, when the notion of strict hereditary right was growing. When Harold is blamed at the time, it is not for disregarding the hereditary right of Eadgar, but for breaking his own personal engagement to William. Whatever was the nature of that engagement, its breach was at most a ground of complaint against Harold personally; it could give William no claim as against the people of England. According to English law, William had no shadow of claim. The crown was not hereditary but elective; and he was not elected to it. Nor had he even any hereditary claim; for he was not of the kingly stock of Cerdic. The alleged bequest of Eadward was cancelled by the later bequest in favor of Harold. The whole question was a personal question between William and Harold. A single act of homage done by Harold to William when in William's military service could not bind Harold to refuse the crown which the nation offered him. The engagement to marry William's daughter was undoubtedly broken. To this charge we have Harold's own answer: A King of the English could not marry a foreign wife without the consent of his Witan.

Claims of William.

William then had no claim to the crown on any showing, either of natural right or of English law. But, by artfully working together a number of points which had no real bearing on the matter, he was able to make out a plausible case in lands where English law was unknown. His kindred to Eadward, the alleged bequest of Eadward, the alleged perjury of Harold, the alleged wrong done to Archbishop Robert and the other Normans, were able to be worked into a picture which gradually won supporters to William, first in his own duchy, and then beyond its bounds. His own subjects, who at first listened but coldly, were before long stirred to zeal in his cause. Foreign princes encouraged him; to the Roman see above all it was the best of opportunities for winning increased power in England. Pope Alexander II., under the influence of his archdeacon Hildebrand, afterwards the renowned Pope Gregory VII., approved of William's claims. He was thus able to cloak his schemes under the guise of a crusade, and to attack England alike with temporal and spiritual weapons.

William's invasion of England.

Thus doubly armed, the Norman duke set forth on his enterprise against England. He had not a single partisan in the country; but Tostig, the banished Englishman, was indirectly doing his work. For Tostig William was too slow; he betook himself to Harold Hardrada, the famous king of Norway, and either stirred him up to an attempt on England or joined him in an attempt which he had already planned. Harold of England was thus attacked at once by two enemies, either of whom alone it might be hard to overcome. The Norwegian came first; he landed in Yorkshire, defeated Eadwine and Morkere at Fulford, and on September 24 received the submission of York. Harold of England on the morrow overthrew the Norwegian invader at Stamfordbridge. Three days later the Normans landed at Pevensey; the English king marched southward; the northern earls kept back their forces, seemingly in the hope of a division of the kingdom. On October 14, Harold, at the head of the men of Wessex, East-Anglia, and part of Mercia, met William and his host on the hill of Senlac. After a hard-fought struggle, the Normans by a stratagem made their way on to the hill; the king was wounded by an arrow and cut down by four Norman knights, and his personal following was slaughtered around him. The first step in the conquest of England was thus taken; but the work was far from being done. After the fall of Harold, William had never again to fight a pitched battle; the land was without a leader, and therefore without union. Local resistance was often valiant; but it was only local resistance, and the land was conquered bit by bit.

His election as king.

On the death of Harold, the Witan in London chose Eadgar to the vacant throne. But the Mercian earls failed him, as they had failed Harold; and their treason hindered any general national resistance. Before the end of the year, the newly chosen king and a large body of the chief men of the realm found it expedient to submit to the invader. He had then subdued the shires south of London, whose forces had been utterly cut off at Senlac; he had crossed the Thames and

ENGLAND
ACCORDING TO DOMESDAY
Shewing the progress of
WILLIAM'S CONQUESTS.

threatened the city from the north. He was now chosen king and crowned at Westminster on Christmas day. He was thus king by the submission of the chief men, by the rite of coronation, and by the absence of any other claimant. But he was very far from having full possession of the whole kingdom. His actual authority did not go beyond the south-eastern part of the country. His dominions certainly reached from Hampshire to Norfolk. They probably took in Wiltshire, Oxfordshire, and Northamptonshire, with an outlying post in Herefordshire; but the north, the south-west, and the greater part of central England were still unsubdued.

Progress of the conquest.

Plate III.

The conquest of these still independent districts was the result of a series of local campaigns spread over about two years, from the beginning of 1068 to the beginning of 1070. In 1067 William visited Normandy, and the oppression of his lieutenants, his half brother Odo, bishop of Bayeux and earl of Kent, and William Fitz-Osbern, earl of Hereford, stirred up revolts in Kent and in Herefordshire. The Kentish revolt took the strange form of an alliance with a foreign prince, Eustace count of Boulogne, who had been himself in William's service in his invasion. In Herefordshire the movement was more strictly national, though its chief, Eadric, surnamed the Wild, who had never submitted to William, did not disdain an alliance with his Welsh neighbors. Eadric in fact held out till a much later time; but the Kentishmen with their foreign allies were subdued before William's return. At the end of the year the king came back, and with the beginning of the next year he betook himself to the conquest of what was still unconquered. His first march was towards the west, where Exeter and the whole of western England were still independent. They were first subdued in the spring of 1068. After a revolt in the next year, after two attempts in successive years on the part of Harold's sons, western England was finally subdued in the course of 1069. Northern England, as far as the northern boundary of Yorkshire, was first conquered in the autumn of 1068. An attempt on Durham in January, 1069, was defeated. York and the North generally revolted more than once. In September, 1069, Swegen of Denmark sent a great fleet to the help of the English, who were under the leadership of Eadgar, Waltheof the son of Siward, earl of Northampton and Huntingdon, and the other northern leaders. But, in the course of the winter of 1069–70, the whole of northern and central England was finally conquered, Chester being the last point to hold out. After this time there were local revolts, but no very general resistance of any large part of the country. Early in 1070 William reviewed and dismissed his army at Salisbury. At the Easter feast of the same year, being now full king over all England, he was again solemnly crowned by legates from Rome.

Revolt of Hereward.

A distinction must be carefully drawn between the resistance to William's arms in those districts which had never submitted to his authority and the revolts which happened after his power was fully established. The two are however divided by a very short interval of time. In the course of the summer of 1070 the fen-land was in revolt under Hereward. That inaccessible district can never have fully submitted; still the warfare there was a new and distinct outbreak, and not a continuation of the earlier warfare at Exeter, York, and Chester. The abbey of Ely was the centre of resistance, and, in a country which so often formed the last shelter of defeated parties, it was defended for about a year. Earl Eadwine was slain on his way to join the insurgents; Morkere was in the island at the time of its surrender, and was condemned to a life-long imprisonment. Hereward alone, with a few valiant followers, escaped by sea. He appears to have been afterwards reconciled to William, and even to have served him in his foreign wars. The manner of his death is uncertain.

William's earldoms.

The war at Ely was the last patriotic warfare on the part of the English against William. He was now undisputed master of England; the nation had learned that the time for national resistance was past, and that local revolts could avail nothing. On the Welsh border he established the great earldoms of Chester, Shrewsbury, and Hereford, whose holders largely extended the power of the English kingdom at the expense of the Britons. Northumberland was entrusted to the care of a succession of earls, first English, then Norman. But on this side the frontiers of the kingdom were not at this time enlarged.

Relations with Scotland.

But from the very beginning of William's conquest the northern frontier was a source of the deepest anxiety. The banished English, and specially the royal family, found shelter at the court of Malcolm of Scotland, who married Margaret, the sister of Eadgar. Under cover of asserting their rights, Malcolm cruelly ravaged northern England. But in 1072 William himself entered Scotland and received the homage of Malcolm at Abernethy. He had thus succeeded to the empire, as well as to the immediate kingdom, of his West-Saxon predecessors. In the next year he employed English troops on the continent in winning back the revolted county of Maine. In 1074 he could afford to admit Eadgar, the rival king of a moment, to his favor.

Revolt of the earls.

Execution of Waltheof.

A revolt which took place in 1075 only showed how firmly William's power was established, and how little disposition there was on the part of the English to rise against him. Two of his own earls rose against him. One, Ralph earl of Norfolk, was an Englishman by birth; but as he came over with William and served with him at Senlac, he must have been banished under Eadward or Harold. His fellow rebel, Roger earl of Hereford, was the son of William's special friend William Fitz-Osbern. These two revolted; but they had to trust mainly to the help of Breton mercenaries or adventurers: Normans and English were leagued against them. The revolt was crushed; Ralph escaped; Roger, like Morkere, spent the rest of his days in prison. But their fall brought down with them the last Englishman who held a secular post of the first rank under William. This was Waltheof, formerly the leader of the English at York, but who had submitted again and had been received to the king's highest favor. Besides his former earldoms of Northampton and Huntingdon, he had received the earldom of Northumberland. That name now means so much of Bernicia as had not passed to the Scottish kings; that is, the present county so-called. Waltheof seems to have listened to the plans of his brother earls; but he took no part in their revolt, and he even revealed the conspiracy to William. Yet he was the only one of the three whose life was taken. After a long imprisonment, he was on May 31, 1076, beheaded at Winchester. At no other time in William's long reign did he send a political enemy to the scaffold; and Waltheof could hardly be called a political enemy. The Norman courtiers and his own Norman wife, the king's niece Judith, seem to have called for his blood. By the English he was looked on as a saint and martyr.

Murder of Bishop Walcher.

Death of William.

The last eleven years of William's reign are far richer in continental than in English events. He was engaged in wars with his French and Breton neighbors, and with his rebellious eldest son Robert. In England a Danish invasion in 1075, in concert with the revolt of the earls, led to a sack of York, and to nothing further. In 1080 Walcher, bishop of Durham and earl of Northumberland, was killed in a popular tumult. A revolt it could hardly be called; but it was cruelly punished by the king's brother Bishop Odo. After this we do not hear of so much as a tumult. In 1086 an invasion from Denmark was again threatened by the Danish king Cnut. His enterprise was stopped by his death by the hands of his own subjects, which won him, somewhat strangely, the honors of martyrdom and the title of a saint. The next year, 1087, William himself died of an accidental hurt received while burning the town of Mantes in warfare with his neighbor and lord, Philip king of the French.

Accession of William Rufus. Revolt of the Normans suppressed by the English.

The Conqueror was now gone, but the tale of the Conquest is not quite over. One act more of the drama is still to be told before we stop to consider the nature, the cause, and the results, of this wonderful revolution. By the dying will of William, Normandy passed to his eldest son Robert; England he wished to be the portion of his second son William. William, surnamed the Red, was acknowledged and crowned without opposition. In the next year (1088) almost the whole of the Norman nobles rebelled on behalf of Robert. The king appealed to his English subjects. By their valor, seconded by the loyalty of the bishops, the Norman revolt was put down, and the crown of the Red King was made safe. This was the last time that Normans and English, as such, met in arms on English soil. The work of the Conquest had been so thoroughly done that it could bear in a certain sense to be undone. The conquest made by the Norman had been so thorough that it was not disturbed even by English victories over Normans. Within twenty-two years after William's landing, his son, the second Norman king, owed his crown to the support of the native English against his own countrymen. Signs of distinction and jealousy between the two races may be discerned for some time longer; but the last open warfare between them was when the English defended the throne of William Rufus against his Norman rebels.

Character of the Conquest.

Such is a short sketch of the leading events of the period which we may call the period of the Norman Conquest. Looking at it simply as an event, it is most important to bear in mind its gradual nature. Nothing can be further from the truth than the notion that England passed at once into the hands of the Normans after a single battle. Still there is a sense in which it is not untrue to say that England was conquered in a single battle. After the fall of Harold, at all events after the northern earls withdrew their forces from the service of Eadgar, the conquest of England was only a question of time. Just as in the days of Æthelred, there was no acknowledged leader; and throughout that age, under a worthy leader, the English people could do everything; without such a one, they could do nothing. There was no man who could gather the whole force of the nation around him. There was no man who could stand up as William's rival either in military or in political skill. Hence, after the one great battle, there was no common effort. The West resisted valiantly; the North resisted valiantly; but the resistance of each was isolated without any intelligent concert. Help came from Denmark; but it was of no avail when there was no generalship, no common plan, and when the Danish leaders were actually bribed by William. In all these ways the strength of the country was frittered away. Ælfred and Eadmund Ironside, whether defeated or victorious, fought battle after battle. They were real leaders. After Harold fell in the first battle, there was no real leader left, and the first pitched battle was the last. Next to the fall of Harold and his brothers in the first battle, William's greatest advantage was the submission of London and of the chief men assembled in London. This enabled him to be crowned king at an early stage of the war, when not more than a third of the country was in his actual possession. From that time his government had a show of legality. The resistance of the west and north was, in fact, as truly resistance to an invading enemy as the fight on Senlac itself. But, when William was once crowned, when there was no other king in the land, resistance to him took the outward form of rebellion. The gradual nature of the conquest, together with William's position as crowned king at the head of an established government, even enabled him to turn the force of the conquered districts against those which were still unconquered, and to subdue England in some measure by the arms of Englishmen. Thus, within five years from his landing, anything like real resistance had come to an end. William was full king throughout the land. The revolt of the earls met with no national support, and the tumult in which Bishop Walcher was killed was a mere tumult, caused by local and personal wrongs, such as might have happened in any age. The one general national impulse of a later date than the fall of Chester was, as we have just seen, that which led the English people to support that son of the Conqueror who appealed to them against that son of the Conqueror who was supported by the Norman nobles.

Title of *Conqueror.*

But the Norman conquest of England was something much more than the mere establishment of a Norman king or a Norman dynasty upon the throne of England. William, we must always remember, did not give himself out as a conqueror. The name *Conqueror*, *Conquæstor*, though applied with perfect truth in the common sense, must strictly be taken in the legal meaning of purchaser or acquirer. William claimed the crown as the lawful successor of Eadward. No doubt he would have been well pleased, if his title had been peaceably acknowledged. As his claim was not acknowledged or taken notice of in any way, he had, from his own point of view, no course left except to make good his rights by force; and, in a land where he had no native partisans, the making good of his rights by force meant the conquest of the land by a foreign army. The peculiar character of the Norman Conquest comes from this, that a legal claim to the crown was made good through conquest by a foreign army. William's accession was something quite different from the mere peaceful succession of a foreign king. It was also something quite different from a mere foreign invasion without any legal pretext at all.

We must here, in considering the effects of the Norman Conquest, distinguish between those immediate effects which are rather the form which the Conquest itself took and those lasting effects which the peculiar nature of the Conquest caused it to have upon the whole future history of England. The peculiar nature of William's claim, and the personal character of William himself, had the deepest influence both on the character of the Conquest itself as an event, and on the character of its permanent results.

Character of William.

We may say generally of William that he was a man who united the highest military skill of his age with a political skill which would have made him great in any age. He knew how to knit together a number of points, none of which really proved anything, but all of which in one way or another told in his favor, so as to give a plausible look to a claim which had no legal or moral ground whatever. He deceived others; most likely he deceived himself. He was in no sort a vulgar oppressor, in no sort a contemptuous despiser of law and right. He never lost sight of a formal justice and of a more than formal piety. He was cruel, in the sense of not scrupling at any severity which would serve his purpose; he was not cruel, in the sense of taking any pleasure in oppression for its own sake. He was guided strictly by the letter of the law, according to his reading of the law. In his own idea, he was not only guided by justice, but he tempered justice with mercy. It is certain that he often forgave those who revolted against him; it is also certain that he carefully abstained from blood except in open battle. When he punished, it was always, with the single exception of Waltheof, by some penalty short of death. That the worse part of his character grew at the expense of the better is not wonderful in such a career. Early in his reign he laid waste Northumberland out of a cruel policy; later in his reign he laid waste a large tract of Hampshire to form a forest for his own pleasure. In his earlier days Exeter withstood him, Le Mans revolted against him. Both those cities he entered as a peaceful conqueror. In his last days he gave Mantes to the flames, and enjoyed the sight, when he had no wrong to avenge on the part of the people of Mantes, but when he was simply stirred up to wrath by a silly jest of their king.

His confiscations and grants of land.

The effect of the peculiar position and character of William was that his settlement was in truth a territorial conquest veiled under legal forms. In William's reading of the law, if he was not himself actually king from the moment of Eadward's death, yet at least he was the one lawful successor to the kingdom. It was therefore treason to fight against him, or to put any hinderance in the way of his taking possession of the crown. The lands and goods of traitors were confiscated to the crown; therefore the lands and goods of all who had opposed William, living or dead, were confiscated to him. The crown lands—and in William's reading of the law, the *folkland* was crown land—of course passed to the new king. The whole *folkland* then, together with the lands of all who had fallen on Senlac, including the vast estates of Harold and his brothers, all passed to William, and was at his disposal. But, as no Englishman had supported his claims, as many Englishmen had opposed him arms, the whole nation was involved either in actual or in constructive treason. The whole soil of England, then, except the property of ecclesiastical corporations, was forfeited to the new king. But William was not inclined to press his claims to the uttermost; at his first entry he allowed the mass of the English landowners to redeem the whole or a part of their possessions. Gradually, after each conquest of a district, after each suppression of a revolt, more land came into the king's power. That land was dealt with according to his pleasure. It was restored wholly, or in part, to its former owners; it was granted away, wholly or in part, to new owners, as William thought good in each particular case. But in every case, whether a man kept his own land or received land which had belonged to some one else, all land was held as a grant from the king. The only proof of lawful ownership was either the king's written grant, or else evidence that the owner had been put in possession by the king's order. Of this process of confiscation and regrant, carried out bit by bit during the whole reign of William, Domesday is the record. We see that, in the course of William's twenty-one years, by far the greater part of the land of England had changed hands. We see further, as we might take for granted in such a case, that by far the greater part of the land which was granted to new owners was granted to William's foreign followers. By the end of William's reign all the greatest estates in England had passed into the hands of Normans and other strangers. But we see also that it is an utter mistake to believe that Englishmen were indiscriminately turned out of hearth and home. A few Englishmen who had, in whatever way, won William's special favor, kept great estates. A crowd of Englishmen kept small estates or fragments of great ones. In a vast number of cases the English owner kept his land as tenant under a Norman grantee. Altogether the actual occupants of the soil must have been much less disturbed than might have seemed possible in so great a transfer of lands from one set of owners to another.

Legal character of William's acts.

The special feature of this great transfer of land from men of one nation to men of another is that it was done gradually and under legal form. It was not a mere scramble for what every man could get; nor was it like those cases in the early Teutonic invasions when the lands of the conquered, or a part of them, were systematically divided among the conquering army. Every step in William's great confiscation was done regularly and according to his notion of law. There was no formal or general distinction between Normans and Englishmen. Every man, Norman or English, was dealt with according to his personal merits. Every man, Norman or English, held his land only by a grant from King William. No general change was made in the tenure of land. The new owner got his land on the same terms on which the old owner had held it. The new owner was clothed with the same rights, and was burdened with the same liabilities, as the old one. William took lands here, and granted them there, according to the circumstances of each case. Most commonly he took from Englishmen and gave to Normans. But he took from Englishmen and gave to Normans, not by virtue of any legal distinction between Englishmen and Normans, but because it was, as a rule, Englishmen who incurred forfeiture by resisting him, Normans who deserved reward by serving him.

His disposal of offices;

of earldoms;

As William dealt with lands, so he dealt with offices. The two processes were to some extent the same; for most ecclesiastical and many temporal offices carried with them land or rights over land. Gradually, and under cover of law, the highest offices in Church and State were taken from Englishmen and bestowed on Normans. At the end of William's reign there was no English earl, but one English bishop, and only a few English abbots. But this change was not made all at once. In the appointment of earls William brought in a new policy which reversed that of Cnut. The great earldoms were broken up. There were no more earls of the West-Saxons or of the Mercians, and the earldom of Northumberland now meant only the modern county. Indeed William did not appoint earls at all, except in districts which were open to attack by land or sea—districts, in short, where the earls would have to play the part of *marquesses*. Kent, Norfolk, Northumberland, Chester, Shrewsbury, Hereford, were William's only earldoms. Each of these had a special duty of guardianship against the Briton, the Scot, the Dane, and any possible enemies from Gaul or Germany. At his coming he established Norman earls in such parts of the earldoms of Harold and his brothers as he thought needed defence. Elsewhere he kept the English earls, and even appointed new ones, as the circumstances of the time dictated. At last, ten years after William's coming, the last English earl was removed by the beheading of Waltheof. Other officers, sheriffs, stallers, and the like, were in the same way gradually changed. But smaller posts largely remained in the hands of Englishmen. It has been noticed, as marking some traits in William's personal habits, that Eadward's English huntsmen kept their places, but that all the new king's cooks were strangers.

of bishoprics and abbeys.

The same system was carried on with ecclesiastical offices also, though in this case a greater degree of caution was needed. The king might by himself, or at all events with the consent of his Witan, remove a sheriff, an earl, or any temporal officer: to remove a bishop or abbot needed, in William's view, full ecclesiastical sanction. Throughout William's reign, when a bishop died, a foreign successor was found for him, and those English bishops against whom any canonical charge could be devised were removed without waiting for their deaths. The same general rule was applied to the abbots, though here the exclusion of Englishmen was not quite so strict. Though the greater number of the newly appointed abbots were strangers, a few Englishmen were appointed to abbeys even down to the end of William's reign. In a series of synods held in 1070 by the papal legates, the new organization of the English Church began. The two metropolitan sees were filled by foreigners. York was vacant in ordinary course by the death of Ealdred; it was bestowed on the Norman Thomas of Bayeux. Canterbury was vacated by the deposition of Stigand, and was bestowed on a far more famous man, Lanfranc of Pavia, William's right-hand man in the settlement of Church and State. Other sees were filled in the same year, and gradually, as bishops died or were deposed, Normans took their places. At William's death, Wulfstan of Worcester was the only bishop of English birth.

Domesday.

Of these changes in the possession of landed property Domesday Book is the great record. This unique and invaluable document was drawn up in pursuance of a decree passed in the Christmas assembly of 1085–1086, and the necessary survey was made in the course of the first seven months of 1086. The immediate object of the survey was a fiscal one, to insure that the tax on the land known as *Danegeld*[1] might be more regularly paid and more fairly assessed. But William further took care to have a complete picture of his kingdom drawn up. We are told in all cases by whom the land was held at the time of the survey, and by whom it had been held in the time of King Eadward. We are told what was the value of the land at those two dates. This is the essence of the inquiry; but we also get a mass of statistics and a mass of personal and local detail of every kind. As a mere list of landowners under Eadward and under William, it enables us to trace the exact degree to which land had passed from Englishmen to Normans. And the incidental notices of tenures, customs, personal anecdotes, the local institutions of districts and towns, are at least as valuable as the essential parts of the survey. With their help we can see England as it was in 1086 more clearly than we can see it at any earlier time, more clearly than we can see it any later time for a long while after. And not the least instructive thing about the survey is the light which it throws on the general character of William's government, the system of legal fictions, the strict regard to a formal justice. William is assumed throughout as the lawful and immediate successor of Eadward. The reign of Harold is ignored. The grant of William is assumed as the one lawful source of property; but there is throughout a clear desire to do justice according to that doctrine, to secure every man in his right, as William understood right, without any regard to race or rank. Powerful Normans, William's own brothers among them, are entered as withholding lands wrongfully, sometimes from other Normans, sometimes from Englishmen. Domesday, in short, may be set alongside of the English Chronicle as one of the two great and unique sources of English history. They are possessions which have no parallel elsewhere.

Assemblies under William.

In the constitution of England William made no formal change, and the particular laws of his enacting were few. The direct changes of his reign had some analogy to the direct changes which followed on the introduction of Christianity. No old institutions were abolished; but some new institutions were set up by the side of the old ones. The old national assemblies went on, without any change in their formal constitution. The real change in their character was not a formal, but a practical one. The assembly which, at the beginning of William's reign, was an assembly of Englishmen with here and there a Norman, had, before the end of his reign, changed into an assembly of Normans with here and there an Englishman. The assemblies, as before, were in ordinary times mere gatherings of the great men of the realm; but, as before, on special occasions, a vast multitude was brought together. Thus, when Domesday was finished in 1086, William gathered all the landowners of his kingdom, great and small, whether his tenants-in-chief or the tenants of an intermediate lord, and made them all become his men. No one act in English history is more important than this. By it William secured his realm against the growth of feudal doctrines and their abuses. It established the principle that, whatever duty a man might owe to any inferior lord, his duty to his sovereign lord the king came first. When this rule was once established, the mightiest earl in England could never be to William what William himself was to his own lord the King of the French. This one act of the wisdom of the Conqueror secured the unity of England for ever.

---

[1] The more correct name is *Heregeld*—that is, a tax for the support of a paid military force. *Danegeld* is, in strictness, money paid to the Danes as blackmail by Æthelred and others. But, as both payments were unpopular, the two names got confounded, and *Danegeld* became the received name of the chief direct tax paid in those times.

The *gemót* of 1086.

Changes in the law.

Of the few actual changes in the law which William made, the most part were mere ordinances enacted to meet the immediate needs of the time. Thus, for instance, in the appeal to the judgment of God, the English ordeal and the Norman wager of battle were alike legalized and regulated. Provisions were made for the safety of William's foreign followers, especially by the singular law of *Murder* and *Englishry*, according to which, if an unknown man was found dead, he was held to be a Norman, unless he could be proved to be English. In legislating against the slave-trade, William only followed in the steps of former kings; but in wholly forbidding the punishment of death, he acted on a personal theory of his own. But it must be remembered that, in William's jurisprudence, the substitutes for death were mutilations which in modern ideas would be deemed worse than death. Most of these provisions were in their own nature temporary. The chief permanent change in our law which was due to an actual ordinance of William was a part of his ecclesiastical reformation, the separation of the temporal and spiritual jurisdictions. Hitherto the bishop and the earl had sat together in the *Scírgemót*, and had heard both ecclesiastical and temporal causes. This was now forbidden, and separate ecclesiastical courts began. The strict forest law of William's reign must also have been an innovation; but it does not exist in the shape of a code; we know it only by the complaints of the contemporary chronicles, and by the practice of later times. In all legal matters the ancient assemblies and the ancient forms went on; nor was there any direct change in the language of the law. English remained, as before, an alternative language with Latin. But from this time the use of Latin gradually encroaches on the use of English. French is not used till a much later time.

Effect of the conquest

But the immediate and formal changes which followed on William's coming were of small account when compared with the indirect, and far more important, changes which came as it were of themselves as the natural result of his coming. A revolution was gradually wrought in everything that touched the relations of the kingdom within and without. But it was a revolution of a strange kind. It was a revolution which seemed, if not to root up our ancient institutions, at least practically so to transform them that they might be deemed to have in truth passed away. It was a revolution which seemed to have broken down the spirit of Englishmen for ever under the yoke of strangers. But what that revolution really did was to call forth the spirit of Englishmen in a stronger and more abiding shape, and to enable us to win back under new forms the substance of the institutions which seemed for a moment to have passed away. This will then be the best place to go through the chief lasting results of the Conquest, and to show how deeply, and in what ways, that event has influenced our institutions and the general course of our history down to our own day.

on foreign relations,

First of all, the Norman Conquest altogether changed the European position of England. As soon as England was ruled by a continental prince who kept his dominions on the continent, Britain ceased to be that separate world which it had hitherto been. And, though after events brought us back in no small degree to our older insular character, yet Britain has never again become so completely another world as it was in the older day. We have already seen that it was through her connection with Normandy that England was first led into that rivalry with France which has had so great an influence on our later history. England took up the quarrel of Normandy, and she carried it on on her own account after Normandy had gone over to the other side. And, besides this special side of our history which is formed by the relations between England and France, the Norman Conquest brought England in every way into closer connection with continental nations generally. In ecclesiastical matters this took the form of a far closer connection with the see of Rome than had been known before. The insular position of Britain had hitherto made the English Church far more independent of the see of Rome than the western churches generally. If the king of the English was looked on as the emperor of another world, the primate of all England was also looked on, and was sometimes directly spoken of, as the pope of another world. And it may be that the very fact that the English Church was more directly the child of the Roman Church than any other of the western churches may really have helped to strengthen the independence of the island church. It was pre-eminently a child. It was not a subject or a servant, nor could it pass for a part of the Roman Church itself. It was a child, but a child of full age, who owed reverence indeed, but who no longer owed servile obedience. One great effect of the Conquest was to weaken this insular independence, and to bring the insular Church more nearly into the same position as the churches of the mainland. In this, as in many other things, the Conquest did but confirm and hasten tendencies which were already at work. The reforms of Dunstan's day marked one step Romewards. Another, we may say, was marked by the pilgrimage of Cnut. The zeal of a new convert naturally filled the Danish king with a special reverence for the chief seat of the religion which he had embraced. The reign of Eadward, a special devotee of the Roman Church, wrought still more strongly in the same direction. In his day the interference of the Roman see in the affairs of England becomes more marked and constant than ever. But the great step of all was taken by William himself. When he sought for a papal confirmation of his claim to the crown of England, he went very far towards clothing the pope with a power to dispose of that crown. In William's own hands the rights of his crown were safe. When Hildebrand himself called on him to do homage for his crown, he refused to do what no king of the English had done before him. So, while the great struggle of investitures was raging in Germany and Italy, William went on in England and in Normandy investing bishops and abbots with the staff, as the kings and dukes before him had done. Nor did Hildebrand ever blame William for doing what he branded as such deadly sin in his own sovereign the emperor. Under William the old ecclesiastical supremacy of the crown remained untouched; but it is none the less true that two acts of his had a direct tendency to undermine it. The separation of the ecclesiastical and temporal jurisdictions led the way to those claims on the part of churchmen to be exempted from all temporal jurisdiction which were unheeded in his day, but which became matter of such important controversy under his successors. And, though he himself firmly refused all homage for his crown, yet, when he made the pope a judge between himself and Harold, he led the way for the day when his descendant took his crown back again as a fief of the Roman see.

on ecclesiastical relations.

English share in the crusades.

In other points also we see the way in which the Norman Conquest opened a path for increased intercourse between England and the continent. It was doubtless mainly owing to the Norman settlers that England took the share which she did in the crusades. The crusades were primarily a Gaulish movement. Germany was less stirred than Gaul, and Scandinavia was less stirred than Germany. England, in her old insular state, could hardly have played a greater part than Scandinavia. Again, with the accession of a foreign line of kings, foreign marriages became more common. The settlement of foreigners in England which began with the conquest and confiscations of William was followed by the coming of settlers of a more peaceful kind, of foreign merchants and of foreign scholars. And, if strangers came to make their fortunes in England, the general breaking down of barriers between nation and nation equally opened the way for the advancement of Englishmen in other lands. These were gradual and indirect results of the great Norman revolution. But the Conquest itself, its confiscations and its outlawries, led directly to an emigration of Englishmen of quite another kind. Englishmen, chafing under the yoke of the stranger, found their way to the extremest bounds of Europe. They took service under the Eastern emperor, and remained the surest bulwarks of his throne against the assaults of Turk and Frank alike.

William hinders feudalism.

With regard to the effects of the Conquest on English institutions, the Norman king stepped into the position of his English predecessors. As king he claimed their rights, and no more. But the circumstances of the Conquest worked in every way to increase his power, and to provide him with new means of influence and new sources of revenue. The notion that William introduced a "feudal system" into England is a delusion which shows utter ignorance both of the position of William and of the general history of Europe. If by a "feudal system" is meant the state of things in Germany and Gaul, a state of things in which every great vassal became a rival to the king, William took direct care that no such "feudal system" should ever be introduced into his kingdom. But if by a "feudal system" is meant merely the holding of land by military tenure, subject to the burdens of reliefs, wardship, marriage, and the like, though William certainly did not introduce such a "system" ready-made, yet the circumstances of his reign did much to promote the growth of that kind of tenure, and of the whole class of ideas connected with it. Such tendencies were already growing in England, and his coming strengthened them. Under him the doctrine that all land is a grant from the crown became a fact. And, though he did not directly innovate on the Old-English tenures, yet we can see that the doctrine of military tenure began in his reign, and that it was put into a systematic shape, and carried out to its logical consequences, in the reign of his son. The Norman kings ruled in a two-fold character; they were all that their English predecessors had been, and something more. The Norman king was the chief of the state; he was also the personal lord of every man in his kingdom. In the one character, he could call out the military force of the state; in the other, he could call on his tenants for the military service due from their lands. As chief of the state, he levied the ancient taxes due to the state; as lord he levied the new-fangled profits which, according to the new-fangled ideas, were due to the lord from his tenants. In short, William brought in that side of feudal doctrine which helped to strengthen the crown, and kept out that side which helped to weaken it. The doctrine that a man was bound to follow his immediate lord had destroyed the royal power in other lands. William, by making himself the immediate lord of all his subjects, turned that doctrine into the strongest support of his crown.

Power of the Norman kings.

This union of two sources of power in the Norman kings made their rule practically despotic. But their very despotism preserved English freedom. They had no temptation to uproot institutions which they found means to turn into instruments of their power. They had no temptation to abolish the national assemblies, in which they found little check on their will, and in which they both displayed their power and practically exercised it. The coming of William practically changed the character of those assemblies; it gradually gave them a new constitution and a new name.

No break in the constitution.

But there was no sweeping away, no sudden revolution; all was done gradually and by force of circumstances at particular times. Thus the forms of a free constitution went on; there is no break between the earliest national assemblies and the latest. At some points of our history, the freedom of England seems sometimes to slumber; but it never died. The seeming slumber under Norman despotism led to the awakening of the thirteenth century. The seeming slumber under Tudor despotism led to the awakening of the seventeenth.

Their two-fold position.

The king was thus in possession of two sources of power, of two sources of revenue. One source came by inheritance from his English predecessors; another came from the circumstances of William's conquest. He was both king and lord of all men within his realm. To the English he was in the first place king; to the Normans he was in the first place lord. Each race had need of him, and the Norman kings knew how to play off each race against the other. In the first days of the Conquest, the king, if he was not the friend of his English subjects, was at least not their worst enemy. His power was some protection against local oppressors. Both William Rufus and Henry I. were raised to the throne by the English in the teeth of Norman opposition. Gradually, as the two races drew together, as in a word the Normans became Englishmen, neither race needed the support of the king against the other, while both alike felt the heavy yoke of his dominion. Instead of the English people siding with the king against the Norman barons, the Norman barons, changed into Englishmen, now became the leaders of the English people against the king.

Changes in the administrative system.

Effects of the practice of summons.

Lords and Commons.

The greatest effect of the Norman Conquest is really to be looked for, not in any sudden changes, least of all in any great and immediate legislative changes, but in a complete, though gradual, change of the administrative system, and in such changes of the law as followed upon those changes in the administration. And even the administrative changes seldom took the form of the utter abolition of anything old. They too rather took the form, sometimes of setting up something new by the side of the old, sometimes only of increasing the importance of one old institution at the expense of another. Thus the national assemblies themselves changed their character, and a variety of institutions were developed out of the national assemblies, by no cause so much as by the growth of the practice of summons. Wherever it becomes usual specially to summon particular members of an assembly, the first step is taken towards the exclusion of all who are not so specially summoned. In the great assembly at Salisbury, where all the landowners of England became the "men" of the king, we see the first germs of Lords and Commons. The Witan are distinguished from the "land-sitting men." By the Witan, so called long after the Conquest, we are doubtless to understand those great men of the realm who were usually summoned to every assembly. The vast multitude who came to do their homage to the king were summoned only for that particular occasion. The personal right of summons is the essence of the peerage. It is the distinctive mark round which all the other honors and privileges of the peer have grown. The earls and the bishops of England, by never losing their right to the personal summons, have kept that right to personal attendance in the national assembly which was once common to all freemen, but which other freemen have lost. The House of Lords represents by unbroken succession the Witan of the assembly of Salisbury; that is, it represents by unbroken succession the old assemblies of the Teutonic democracy. Never did any institution so utterly change its character. But the change has been the gradual result of circumstances, without any violent break. The "land-sitting" men, on the other hand, not summoned personally or regularly, but summoned in a mass when their attendance was specially needed, gradually lost the right of personal attendance, till in the end they gained instead the more practical right of appearing by their representatives. Thus grew the Commons. The steps by which our national assemblies took their final shape do not begin till a later time. But it is important to notice that the first glimpse of something like Lords and Commons—a distinction which doubtless already existed in practice, but which is nowhere before put into a formal shape—dates from the last years of the Conqueror.

The King's Court.

The practice of summons thus gave birth to our final parliamentary constitution. It gave birth also to a vast number of administrative and judicial institutions, of which we see traces before the Conquest, but which put on their definite shape under the Norman kings. The practice of summons produced the House of Lords. It produced also the *curia regis*, the King's Court, out of which so many institutions grew. The King's Court is properly the national assembly itself; but the name gradually came to be confined to a kind of judicial and administrative committee of the assembly. Even before the Norman conquest, we get a faint glimpse of a body of the king's immediate counsellors, bearing the name of the *Theningmannagemót*. Out of this body, to which was gradually attached the name of *curia regis*, grew, on the one side, the Privy Council, and out of that the modern Cabinet, and on the other side the courts of law. The Cabinet, our most modern political institution, an institution so modern as to be unknown to the written law, is the last growth of the principle of summons. The Cabinet, the body to which in common use we have latterly come to give the name of *Government*, is simply a body of those privy councillors who are specially summoned. Those who are not summoned stay away. All the king's courts, administrative and judicial, grew in the same way. They were committees of the national assembly, which gradually grew into separate being and separate powers, as the legislative, executive, and judicial branches of government parted off more distinctly from one another.

The great officers.

The exchequer.

Along with the practice of summons grew the importance of those who were most specially and habitually summoned, the great officers of the king's court and household. Soon after the Conquest these officers began to rise into an importance which they had never held before. They may be divided into officers of state and officers of the household. The notion that offices in the royal household were honorable is part of the general doctrine of the *comitatus* and its personal service, the doctrine out of which grew the nobility of the thegns. Some of these offices were simply old offices with new names. The *staller* became the *constable*, the *bower-thegn* became the *chamberlain*, the *steward* kept his English name. Some of these posts became hereditary and almost honorary. In some cases, as in that of the chamberlain and the steward, a secondary office of the same name grew up. Of greater importance and interest are those officers into whose hands came the chief powers of government under the king. Nothing is so important under the Norman reigns as the exchequer. But the exchequer is simply an old institution with a new name, and the treasurer is simply an old officer with a new name. The king's *hoard* or treasury must always have had a keeper; but the *hoarder*, under the Latin name of *treasurer*, grew into increased importance in times when the main object of government seemed to be to fill the king's hoard. The hoard or treasury got the playful name of exchequer,[1] and it grew into two departments of state, administrative and judicial. The treasurer himself grew into an officer of such power and dignity that, for a long time past, his office has been put into commission among several holders. And of these the chief has drawn in late years to himself more than the power, though without the dignity, of the old single-headed treasurer. The chancellor again is found by that title under Eadward the Confessor, and his office must have existed under some title as early as there was any settled government at all. But it is under the Norman kings that he gradually grew to great importance and dignity, an importance and dignity which have been more lasting in his case than in the case of any other of the great officials of those days. But the greatest dignitary of the Norman reigns, the justiciar, really seems to have been wholly new. The name is first given to the regents who represented William in his absence from England; and the office may well have grown up through the need which was felt for some such representative when the king visited his dominions beyond sea. The justiciar appears as the first in rank among the great officers of state; but while the chancellorship, remaining a single office, grew, the office of the justiciar was gradually divided among many holders. Among them all those, great and small, who administer justice in the king's name may claim to have a share.

The judicial system.

The king's judges displace the local judges.

Origin of the jury.

Recognitions.

The modern judicial system of England begins, in something like its present shape, in the reign of Henry II. But its growth is one of the direct results of the Norman Conquest. The older judicial system is essentially local and popular. The men of the township, of the hundred, of the shire, come together under their local chiefs. The highest judicial body of all, as well as the highest legislative body of all, the assembly of the nation, comes together under the chief of the nation, the king. At least as early as the reign of Æthelred we find examples of royal commissioners, like the *missi* of the Frankish emperors and kings, who are sent on the king's errand to the local courts. After the Conquest this system grows, till in the end the local chiefs, the earl and the bishop, are wholly displaced by the king's judges. Thus grew up the lawyers' doctrine that the king is the fountain of justice. But the popular element survived in the various forms of the jury. It is idle to debate about the invention or introduction of trial by jury. The truth is that it never was invented or introduced, that, even more than other institutions, it emphatically grew. Its germ may be seen in all those cases, compurgation or any other, where a matter is decided by the oaths of men taken from the community at large. The Conquest caused a step in advance by the more constant employment of recognitions taken on oath. Under Henry II. the practice was still further strengthened; but it was not till long after his day that the modern idea of the jury was established, as no longer witnesses but judges of facts. When their judicial character was fully established, that is, when in the reign of Charles II. they ceased to be called to account for their verdicts, the old popular character of the courts in a great measure came back to them.

Centralization of justice.

In this way justice became more centralized in England than anywhere else. All the weightier causes came to be tried either in the king's own courts or by judges immediately commissioned by him. The local chiefs gave way to the king's representatives. One local officer indeed grew into increased activity. This was the officer who in each shire had always been specially the king's officer, the *shire-reeve* or *sheriff*, who looked after the interests of the king, while the ealdorman or earl represented the separate being of the shire. Under William, earls ceased to be appointed, save where they had distinct military duties. Under his successors earldoms gradually sank into merely honorary dignities. But the sheriff was in the Norman reigns the busiest of all officers; for he had to collect and bring in all that was due to the royal exchequer from the endless sources of income by which it was fed.

Folkland becomes *terra regis*.

Growth of manors.

The main political result of the Norman Conquest thus was to strengthen every tendency that was already in being—and such tendencies have been powerfully at work ever since the beginning of the growth of the thegnhood—by which the king, his authority, his officers, took the place of the nation and its authority. But the older system was undermined rather than overthrown, and the course of our history has, to a great extent, given us back the old institutions under other shapes. Thus, for instance, there was a strong tendency at work to turn the *folkland*, the land of the nation, into the land of the king. To this process the Conquest gave the finishing touch. The stroke by which the whole lay soil of England was held to be forfeited to the Conqueror turned all *folkland* into *terra regis*. From Domesday onward the *folkland* vanishes; but now that the crown lands are placed under the control of parliament, as part of the national revenue, the *terra regis* has practically become *folkland* again. And while the king, the highest lord, was thus encroaching on the nation, that is, on the community which took in all others, smaller lords were doing the like to the lesser communities which made up the nation. Under the older system all grants of *sac* and *soc*, that is, all grants to a particular person of any special jurisdiction exempt from the ordinary local courts, were in their own nature exceptional. As the new ideas grew, the *manor*, as it was called by the Normans, finally supplanted the *township*. Lawyers gradually found out that the exceptional novelty was the original state of things. Just as they ruled the king to be the fountain of justice, because he had gradually taken the administration of justice into his own hands, so they ruled that, wherever any rights of the community had escaped the grasp of the lord, their existence must necessarily be owing to an unrecorded grant of the lord. The ancient court of the people, the *court baron*, was held to be the court of the lord. Here again the evil has cured itself. The lord and his court have become harmless; but they remain as curious examples of the way in which lawyers have read the history of England backwards.

New idea of kingship; property rather than office.

Both as regarded the greater lord and the lesser, the tendency of the ideas which the Norman Conquest strongly confirmed was to put the notion of property before the notion of office. Kingship, the highest office in the commonwealth, came to be looked on mainly as a possession. The king of the people has now put on the character of the lord of the land; his title gradually changes into a form which better expresses this new position. The *King of the English* gradually changes into the *King of England.* William himself is still almost always *Rex Anglorum.* But the new territorial title now begins to creep into use, and from the beginning of the thirteenth century it altogether displaces the older style. But the new ideas did much more than merely change the royal style. As soon as office had changed into property, as soon as the chief of the people had changed into the lord of the land, the old rule that the king should be chosen out of the one kingly house began to stiffen into the doctrine of strict hereditary right. The general results of the Conquest were all in favor of that doctrine; but the circumstances of the reigns which immediately followed the Conquest all told the other way, and helped to keep up the elective character of the crown for some time longer. The ancient doctrine died out very slowly, but it did die out in the end. And then lawyers found out that the crown had been hereditary from the beginning, and ruled that the king never died, and that the throne never could be vacant. On the other hand, as office was turned into property, so property in land was turned into office, and carried with it much of the likeness of a miniature sovereignty. The doctrine of primogeniture also now naturally supplanted the old principle of division of lands. No doctrine could be more opposite to the old doctrine of nobility than the doctrine which gave everything to a single son in the family. In this way primogeniture has its good side. It gave us a peerage; but, in giving us a peerage, it saved us from a *noblesse.*

---

[1] The older names are *fiscus* and *thesaurus*. *Scaccarium* or *exchequer* was the established name by the time of Henry II. It comes from the parti-colored cloth with which the table was covered, which suggested the notion of a chess-board.

Primogeniture.

Ecclesiastical results of the Conquest.

Change in the position of bishops.

Exemptions of monasteries and chapters.

The immediate ecclesiastical effects of the Norman Conquest, those which in truth formed part of the process of conquest, have been already spoken of. But the introduction of foreign prelates, and the closer relations with Rome, worked in many ways. The foreign bishop naturally stood at a greater distance from the native clergy than his English predecessor had done. Moreover, the new theories as to the tenure of land turned the bishop into a baron, holding as a tenant-in-chief of the crown. The bishop became in his own diocese more of a lord and less of a father, while he was often kept away from his diocese by holding high temporal office. It gives a false view of the case to say that the prelates grasped at high temporal office: the case rather is that, in a time when education was chiefly confined to the clergy, public business was mainly in the hands of the king's clerks, and that they received bishoprics as the reward of their temporal services. Under such bishops the Church was secularized and feudalized. Ecclesiastical livings were looked on less as offices with an endowment for the maintenance of the holder than as *benefices* charged with certain duties which might be discharged by deputy. The relation of the parish priest to his bishop put on the likeness of the relation between a man and his lord. At the same time, the rage for founding monasteries, which was at its height in Normandy at the time of the Conquest, came into England with the Normans, and in the next century drew a fresh impulse from the foundation of the Cistercian order. The love of exemptions of all kinds led to a constant striving on the part of ecclesiastical bodies to be exempted from the ordinary ecclesiastical jurisdiction. This is shown, not only by separate monasteries, but even by the cathedral chapters, especially where the place of the chapter was filled by a monastic body. And one immediate result of the Conquest was the transfer of the seats of several bishoprics from smaller towns to greater. This was in accordance with the continental notion of a bishop, by which he was looked on as primarily bishop of a city, while in English ideas he was rather the bishop, first of a tribe, and then of a district. But this very change, one made by the Norman bishops themselves, may well have helped to bring about that separation between the bishop and his church which dates from this time. The bishop who had become a feudal lord, even when he was not altogether away from his diocese on the king's service, commonly fixed his dwelling-place in his rural castle rather than in his palace in the city.

The social results of the Conquest were such as naturally followed on the general transfer of the greatest estates and highest offices of the country. The Conquest itself, the military occupation of William, was followed by a peaceful immigration of Normans and other strangers into England, especially into the merchant towns. London, above all, received a crowd of citizens of Norman birth. That these men, and the Norman settlers generally, turned into Englishmen in a wonderfully short time is one of the great features of our history. The causes are easy to see: with most men, if there be no special reason to the contrary, place of birth goes for more than descent by blood, and the stranger is gradually assimilated by the people among whom he dwells. And, in the case of Normans and English, we can hardly doubt that original kindred went for something. The Norman was simply a Dane who had adopted the French tongue and some French fashions; he was easily won back into the Teutonic fold. But the circumstances of William's conquest, his pretended legal claim to the crown, and the whole system of legal fictions which grew round that claim, helped largely to bring all classes of his subjects together. The Norman settled in England was driven to become in some sort an Englishman. He held his estates of the King of the English, according to English law. The fusion of the two races was so speedy that a writer a little more than a hundred years after the Conquest, the author of the famous *Dialogus de Scaccario,* could say that, among the free population, it was impossible to tell who was of Norman and who was of English birth. That is to say, the great nobles must still have been all but purely Norman; the lowest classes must have been all but purely English. In the intermediate classes, among the townsmen and the smaller landowners, the two races were so intermixed, and they had so modified one another, that the distinction between them had been forgotten. We might say that the effect of the Norman Conquest was to thrust every class, save one, of the older English society a step downwards. The churl, the simple freeman, had been gradually sinking for a long time before the Conquest. In the course of the century after the Conquest, he finally sank into the villain. On the other hand, if the churl gradually sank to the state of villainage, the slave gradually rose to it. The Norman Conquest, while thrusting down every other class, undoubtedly helped to raise the most wretched and helpless class of all.

The Normans become English.

Changes in social relations.

Chivalry.

But while the Normans who settled in England changed into Englishmen with remarkable speed, they of course, by the very fact of their fusion, did much to modify the character of Englishmen. A way was now opened for all that class of ideas which, for want of better names, may be called feudal and chivalrous. Chivalry is rather French than Norman; and its development comes rather under the Angevin than under the Norman kings. Still, so far as Normandy was influenced by France, so far as the Norman Conquest opened a way for French influence, and, we may add, French kings, in England, so far this whole class of ideas and feelings may be set down as results of the Norman Conquest. But in England chivalry never was really dominant. Teutonic notions of right and common sense were never wholly driven out. For the man unassisted by birth to rise was harder in some ages than in others. There was no age in England when it was wholly impossible.

Effects on language.

Late use of French.

The greatest of the outward changes which were caused by the Norman Conquest was its effect on the language and literature of England. In the matter of language, as in other matters, the Conquest itself wrought no formal change. Whatever change happened was the gradual result of the state of things which the Conquest brought about. French was never substituted for English by any formal act. Documents were written in English long after the Conquest; and, though the use of English gradually dies out in the twelfth century, it dies out, not in favor of French, but in favor of Latin. French documents are not found till the thirteenth century; they are not common till the latter part of that century. As it was with institutions, so it was with language. The old language was neither proscribed nor forgotten, but a new language came in by the side of it. William himself tried to learn English; his son Henry, if no other in his family, understood English, and seems even to have written it.

English the common speech.

Henry II. understood it, but seemingly did not speak it. By the end of the twelfth century, English seems to have been the most usual tongue among people of all classes. It was the language of common speech and of purely popular writings; French was the more polite and fashionable language, the language of elegant literature; Latin was the language of learning. Every educated man in the latter part of the twelfth century must have been familiar with all three.

Changes in the English language.

Loss of inflexions.

Infusion of foreign words.

A foreign language was thus brought into England alongside of the native language, and it displaced the native language for certain purposes. Such a state of things could not fail to have a great effect on the English language itself. That effect largely took the usual form of strengthening tendencies which were already at work. The two changes which took place were the loss of the old inflexions and the infusion of foreign words into the vocabulary. Neither of these processes began with the Conquest; the Conquest simply strengthened and quickened them. The other Low-Dutch and Scandinavian tongues, which were brought under no such influences as English was by the Conquest, have lost their inflexions quite as thoroughly as English has. Even the High Dutch, which keeps a comparatively large stock of inflexions, has lost a large part of the forms which were once common to High and Low. We may be sure then that we should have lost our inflexions, or most of them, even if the Normans had not come. Indeed, in one form of English, the dialect of the North, the inflexions had largely given way already, chiefly, it would seem, through the influence of the Danes. But when English lost its place as a polite and literary speech, when, though spoken by all classes, it was written only for the lower classes, there was no longer any fixed literary standard; the grammatical forms therefore became confused and inaccurate. We see the change at once in those parts of the Chronicles which were written in the twelfth century. On the other hand, the English tongue had taken in a few foreign words from the first coming of the English into Britain. The Roman missionaries brought in another stock. The Normans brought in a third. But the third stock, like the second, consisted for a while mainly of words which were more or less technical; they were new names for new things. Through the twelfth century the two languages stood side by side, without either borrowing much from the other. It was not till the thirteenth century that French words came in to any great extent to express things for which the English tongue had names already. Thus the English tongue gradually put on its later character. It remained Teutonic in its essence, Teutonic in its grammatical forms. But it lost its inflexions, more thoroughly than some kindred tongues, not more thoroughly than some others. It also received a vast infusion of Romance words into its vocabulary, an infusion far greater in degree, but exactly the same in kind, as the Teutonic infusion into the vocabulary of the Romance languages, especially into French.

Effects on literature.

In literature, as distinguished from language, and also in art, the Norman Conquest is one of the most strongly-marked epochs in our history. The breaking down of the barrier between the insular and the continental world did much for both. Learning had gone down again in England through the Danish invasions; and Eadward the Confessor, with all his fondness for foreigners, did little for foreign scholars. Under William and his son Henry things altogether changed. The first two occupants of the see of Canterbury after the Conquest were the two greatest scholars of their day. Both of them were strangers in Normandy no less than in England: Lanfranc came from Lombard Pavia, Anselm from Burgundian Aosta. After them England herself produced a goodly crop of scholars among her children of both races. While the Chronicle was still writing in our own tongue, a crowd of learned pens recorded English history in Latin. Florence of Worcester told the unvarnished tale of the early Norman reigns in a chronicle which is English in all but language. Henry of Huntingdon preserved to us large fragments of our ancient songs in a Latin dress. William of Malmesbury aspired to the character of a critical historian, a character still more nearly reached somewhat later by William of Newburgh. The statesmen-historians of Henry II.'s day follow, and lead us on to the monastic historians of the thirteenth century. Yet, after all, one would gladly exchange much of the light which they give us for a continuation of the English Chronicle in the English tongue.

Change in proper names.

One form of influence on language was the almost complete exchange of the Old-English proper names for a new set of names which came over with the Conqueror. The strictly Norman proper names, those which the Normans either brought with them from the North or had borrowed from the Franks, are as truly Teutonic as the English names; a few names only were common to both countries. But, just at the time of the Conquest, the Normans were beginning to adopt scriptural and saintly names, which were all but unknown in England. With the Conquest a new fashion set in, and the names, whether Teutonic or saintly, which were in Norman use gradually displaced the ancient English names. A few specially royal and saintly names, like Eadward and Eadmund, alone survived. Throughout the twelfth century we constantly find the father bearing an English name, while the son has one of the new fashion. This point is of importance. It at once marks and hides the fusion of races. It helps us to see that many a man who was to all outward appearance a stranger was in truth of genuine English descent.

Use of hereditary surnames.

Along with the change in personal names came in the use of hereditary surnames. Surnames, in the sense of mere personal descriptions or nicknames, were already common both in England and in Normandy. But the hereditary surname, the name of the family handed on from father to son, was at the time of the Conquest unknown in England, and it was only just coming into use in Normandy. The Normans brought the fashion into England, and the circumstances of the Conquest gave it a fresh impulse. While many of the Norman settlers brought with them the surnames which they had already taken from their estates or birth-places in Normandy, a crowd of men of both races now took surnames from their estates and birth-places in England. The fashion to some extent affected local nomenclature also. On the whole, the Norman Conquest made but little change in this way. Few places, if any, lost their names. But some towns, castles, and monasteries of Norman foundation received French names; and a crowd of English towns and villages did, as it were, take Norman surnames, by taking the name of a Norman lord to distinguish them from other places of the same name.

Changes in architecture.

The Norman style.

In those days art was almost synonymous with architecture, and the changes in that art which were wrought by the Norman Conquest were great indeed. There was then but little room for great displays of artistic architecture anywhere but in churches. But in this, as in all periods of genuine art, the style used for buildings of all classes was the same. Up to the eleventh century all Western Europe had built in one style, in that older form of the Romanesque or round-arched architecture which came direct from Italy and was known as the *mos Romanus*. Its most striking feature is the tall, slender bell-towers which in England are a sign of work not later than the eleventh century, while in Germany they go on through the twelfth, and in Italy they never went out of use at all. In the course of the eleventh century several parts of Europe struck out new styles of their own, which still keep the round arch, and which are therefore properly classed as later varieties of the Romanesque type. One of these arose in Normandy, and was, among other Norman fashions, brought into England by Eadward in the building of his new church at Westminster. After the Conquest the Norman style naturally became the prevailing fashion. One part of that fashion was the building of churches on a gigantic style, such as had never before been seen in England. This fashion led the Norman bishops and abbots to pull down and rebuild most of the minsters of England. The earliest Norman style was an advance on the Primitive Romanesque in proportion and in vigor of style, casting off the mere imitation of Roman models which had lingered for so many ages. But in mere amount of ornament it was certainly no advance. The enriched Norman style comes in later. However, from the reign of William, one might perhaps say from the reign of Eadward, the older style gave way to the new. The Primitive models were now followed only in smaller and less important churches, where the use of the slender bell-towers lasted longer than any other feature. Yet the Norman style, in supplanting the earlier English fashion, was in some measure influenced by it. The Norman churches of England have some distinctly English features of which there is no sign in those of Normandy.

Norman castles.

We are told that great improvements in domestic architecture were brought in by the Normans; but, when we see the few Norman houses that are left to us, we may be inclined to think that the chief change was the freer application of stone to domestic work. It was only in houses of the very highest class, as in kings' palaces, that there was room for any great display of art. Such buildings allowed of the great hall, with rows of columns and arches, like those of a church. For municipal architecture there was as yet no room in our island. But military architecture took one of its greatest steps in this age. Fortification had advanced in England from the hedge or palisade which Ida built at Bamburgh to the wall of squared stones with which Æthelstan had surrounded Exeter. But the Norman *castle*, name and thing, was brought in as something new in the days of Eadward, and the land was covered with them in the days of William. The massive square tower, of which the Conqueror's Tower of London is the greatest example, is one type. The shell-keep, the polygonal wall raised most commonly on a mound of English work, is another type. In the days of our forefathers the castle was the very embodiment of wrong and oppression. The Chronicle never speaks of castle-building without some epithet of horror.

Changes in warfare.

One result of these changes in the art of fortification was largely to change the character of the warfare as well as the tactics of the age immediately following the Conquest. The older warfare of England is a warfare of pitched battles. Such is the warfare of Ælfred; such is the warfare of Brihtnoth and Ulfcytel and Eadmund Ironside. But the warfare of the twelfth century is mainly a warfare of sieges. The taking of towns and castles is endless; but between Senlac and the wars of the thirteenth century we hardly meet with more than two great battles in the open field, those of Tinchebrai and the Standard.

The changes in the character of warfare were accompanied by a more general change in the art of war. An ancient English army fought on foot; the horse was used only to carry the warrior to the field. When the time for action came, the king or ealdorman and all his following dismounted. The old national weapon was the sword, which under Cnut was exchanged for the heavy Danish axe. The English armies of the eleventh century consisted of two classes, both footmen. The housecarls, the paid force, and the thegns and other personal followers of the king, wore coats of mail and carried shields, which could be made into a kind of fortification called the shield-wall. They hurled javelins at the beginning of the fight, and came to close conflict with the axe. The irregular levies of the shires came armed with axes, javelins, clubs, or any other weapons that they could bring. But there was no cavalry, and there were but few archers. In the Norman system of warfare, cavalry and archers are the chief arms. The mailed knights charge on horseback with long lances raised high in the air; they use the sword, and sometimes the iron mace, for close combat. The infantry are mainly archers; the mounted archer is rare. With the Conquest the Norman tactics naturally displaced the English. The Englishman grasped the weapon of his conqueror, and the fame of the English archers began. Yet the Norman manner of fighting was itself to some extent influenced by English practice. The English archer, though he had changed his weapon, was really the true heir of the English axeman. In the fourteenth century, as in the eleventh, the main strength of an English army lay in its infantry. And, earlier than this, the old traditions of English warfare were sometimes followed by the the Normans themselves. More than once in wars of twelfth century we find kings and nobles getting down from their horses and fighting on foot, axe in hand, like Cnut or Harold.

Summary.

We can now sum up the main results of the Norman Conquest. We can be hardly wrong in calling it the most important event in English history since the first coming of the English and their conversion to Christianity. It was a great and a violent change, a change which, either in its immediate or in its more distant results, touched everything in the land. Yet there was no break, no gap, parting the times before it from the times after it. The changes which it wrought were to a great extent only the strengthening of tendencies which were already at work. The direct changes which we may look upon as forming the Conquest itself, as distinguished from its more distant results, were done at once gradually and under cover of legal form. No old institutions were uprooted, though some of them were undermined by new institutions set up alongside of them. The revolution which seemed to be the overthrow of English freedom led in the end to its new birth. Under an unbroken succession of native kings, freedom might have died out step by step, as it did in some other lands. As it was, the main effect of the Conquest was to call out the ancient English spirit in a more definite and antagonistic shape, to give the English nation new leaders in the conquerors who were gradually changed into countrymen, and, by the union of the men of both races, to win back the substance of the old institutions under new forms.

Reign of William Rufus.

War with France.

Election of Henry I.

His conquest of Normandy.

Under the sons of the Conqueror England appears for the first time in her new European character. Looking at her simply as a power, without regard to the nationality of her inhabitants, she now appears as an insular power making conquests on continental ground. William Rufus, placed on the throne by the English people in opposition to a Norman revolt, broke all his promises of good government, and ruled as one of the worst tyrants in our history. But it would be hard to show that he was an oppressor of Englishmen as Englishmen. His rule was rather a tyranny which pressed on all classes and all races, though the native English would doubtless be the class which felt it most bitterly. Godless and vicious beyond all parallel before or after, he was still a captain and a statesman, and no king better knew how to make use of every art to advance the power of his kingdom. He won a large part of Normandy by force of arms; and, when his brother Robert set forth on the crusade, he obtained the whole duchy under cover of a mortgage. Maine revolted and was won back; a purchase of Aquitaine was negotiated; Rufus was believed to have designs on the crown of France itself. A short war waged between Rufus and Philip of France, a war which now begins to put on the character of a war between England and France, rather than that of a mere war between the duke of the Normans and his overlord at Paris. The wealth and strength of England now for the first time directly told in continental affairs. But the schemes of the Red King were cut short by the stroke of an arrow in the New Forest (2d August, 1100). By an agreement between William and Robert, if either died childless, his brother was to succeed to his dominions. But at the death of Rufus, Robert was far away on the crusade, and the English nation had never paid much heed to any attempts to settle the succession of the crown before a vacancy. Henry, the youngest son of the Conqueror, the only one of his sons who was the son of a crowned king and born on English ground, was unanimously chosen and speedily crowned. An Englishman by birth, if not by descent, he further married a wife who had some English blood in her veins, and who, in the eyes of his subjects, passed for an Englishwoman. This was Edith, the daughter of Malcolm of Scotland, who at her marriage took the Norman name of Matilda. The English king and the English queen were mocked at by the Norman courtiers, who again conspired to bring in the Norman duke. Again a son of the Conqueror owed his crown to English loyalty. A second Norman invasion of England followed. Robert landed at Portsmouth, as his father had landed at Pevensey, but the policy of Henry found means to send him and his host away without fighting (1101). One of the usual agreements was made, an agreement which had little chance of being kept, by which again each brother was to succeed to the dominions of the other in case of the failure of direct heirs. But Robert was incapable of ruling his own dominions; a party in Normandy invited the King of the English to save the duchy from anarchy. Two campaigns, ending in the great fight of Tinchebrai (1106), brought Normandy into the hands of Henry. Men at the time looked on the day of Tinchebrai as the reversal of the day of Senlac. Normandy was conquered by England, as England had before been conquered by Normandy. Such a view put forth only one side of the case; but from one side it was true.

Wars with France.

Intended succession of Matilda.

During the rest of Henry's reign there was perfect peace in England; but nearly the whole time was filled with continental wars. The warfare between France and England, of which there had been only a glimpse in the days of Rufus, now began in earnest. It is true that the wars of Henry were waged wholly for Norman and not at all for English interests, and Englishmen at home bitterly complained of the taxes which were wrung from them for wars beyond sea. But it is none the less true that, in their European aspect, they were English wars, and that they tended to give the England of Henry a wholly different position from the England of the days before the Conquest. The later years of Henry were chiefly occupied in schemes of dynastic policy on the continent. His only legitimate son, the Ætheling William, to whom homage as his successor had been done both in Normandy and in England, was drowned in 1120. The king's daughter Matilda had been married to the emperor Henry V. Strict alliance with Germany formed part of Henry's policy, as it had formed part of the policy of Godwine and Harold; and the two Henries, emperor and king, joined in warfare against Lewis of France. On the death of the emperor, Matilda returned to England, and, by an act without precedent either in his kingdom or in his duchy, Henry procured that homage should be done to his daughter as his successor. No more striking comment can be needed as to the growth of the new ideas of kingship. The crown was beginning to be so thoroughly looked on as a possession that it was deemed that it might pass to a woman. On the other hand, no settlement could be more opposed to modern notions of hereditary right. When homage was first done to Matilda, Robert's son William, who, according to modern notions, was the direct heir of the Conqueror, was still living. In Normandy indeed he was his uncle's enemy, and in England his claims seem never to have been heard of. But, in the lack of legitimate male heirs, the choice either of the king's natural son Robert or of his sister's son Stephen would have been much less opposed to earlier ideas, both English and Norman, than the succession of Matilda. The imperial widow was presently married to Geoffrey of Anjou, a marriage clearly designed with a view to the enlargement of the continental dominions of her father's house.

Election of Stephen.

The anarchy.

Succession of Henry II.

Plate IV.

European position of Henry.

King Henry died in 1135, leaving, as he deemed, the succession to his daughter and her young son Henry. As usual, an arrangement made before the vacancy was set aside, and the choice of England fell on Stephen. The case of the new king's election was not unlike the older and more famous case of the election of Harold. In itself it was perfectly good. Against it stood the fact that Stephen had, with the rest of the chief men, sworn to the succession of Matilda. Stephen then was a perjurer as regarded his own soul; he was no usurper as regarded the nation. He was accepted without opposition, and King Henry's son Robert did homage to him with the rest. But Stephen, a man of many winning personal qualities, was utterly unable to reign in those times. Rebellions broke out; Earl Robert asserted the rights of his sister in England, and Normandy was conquered by her husband Geoffrey. The empress landed in England (1139); she was chosen Lady (1141)—the name Queen was not used; but she was never crowned. A civil war, a time of utter anarchy and havoc raged, till (1153) another agreement of the usual kind was made between Stephen and Matilda's son Henry, now duke of the Normans. He had been brought over to England as a child; he had taken his share in the wars; and it was now agreed that Stephen should keep the crown for life, and that Henry should succeed him. This time the agreement took effect. When Stephen died in the next year, Henry succeeded without opposition. Again a duke of the Normans succeeded to the crown of England; but Henry of Anjou, by birth-place Henry of Le Mans, was far more than duke of the Normans and king of the English. To the lands of his mother's father he added the lands of his father, Anjou, Maine, and Touraine; and a politic marriage gave him a greater dominion still. The designs of William Rufus upon the duchy of Aquitaine came to pass in another way. The great dominion of Southern Gaul, Poitou, Aquitaine, and Gascony, had passed to Eleanor the daughter of their last duke. She married Lewis, the heir of the crown of France, who almost immediately succeeded to the kingdom (1137). For a moment France and Aquitaine, Northern and Southern Gaul, the land of *oil* and the land of *oc*, were joined together. It might seem that a kingdom of France, in the modern sense, was about to begin. But the northern king and the southern duchess did not agree. A canonical objection to the marriage was conveniently found, and it was accordingly annulled. The divorced queen at once married the young duke of the Normans (1152). Her dominions came with her, and the prince who now succeeded to the crown of England already held the greatest power in Gaul, a power far greater than that of his nominal lord at Paris. With that dominion he won the undying hatred of the lord whose wife with her splendid heritage had passed to him. The king of Paris was not yet to be master of Southern Gaul. He was to be again shut up in his inland dominion, while his mighty vassal held the mouths of the great rivers and the fairest cities of the land. As England under Cnut might seem to have become part of a Scandinavian empire, so under Henry she might seem to have become part of a Gaulish empire. The strictly Norman period of the English history comes to an end. Normandy and England have alike become parts of the dominions of a king who by female descent might be called either Norman or English, but who, both by birth and by general character, was neither Norman nor English. In ruling over a vast number of distinct states, widely differing in blood, language, and everything else, ruling over all without exclusively belonging to any, Henry II., king, duke, and count of all the lands from the Pyrenees to the Scottish border, was the forerunner of the emperor Charles V.

Fusion of Normans and English.

It was during the reigns of the two sons and the grandson of the Conqueror that the chief steps were taken towards the fusion of English and Normans into one people, or rather towards the change of Normans into Englishmen. At the accession of Rufus the distinction was in full force; at the accession of Henry I. it is clearly visible. In the course of Henry's reign it so far died out that, though it was doubtless not forgotten, it was no longer marked by outward distinction. The name of Englishman now takes in all natives of England, of whatever descent. A tale of a general conspiracy to kill all the Normans soon after the accession of Stephen proves, when it is examined, to mean, just as in the case of the massacre of St. Brice, not a design to slay every man of Norman descent in England, but merely a design to slay a particular body of Norman mercenary soldiers.[1] Everything during these reigns tended to draw the two races more nearly together; nothing tended to keep them apart. The brutal tyranny of Rufus wronged both races alike; yet men of native English descent could rise even under him.[2] The cold despotism of Henry at once benefited and offended both races alike. At one time of his reign we meet with a complaint that he would admit no Englishman to high office. When the complaint is tested, it is found that the exclusion extended to natives of England of both races, that the preference was a preference for absolute foreigners as such. The horrors of the anarchy in Stephen's day fell on both races alike; the foreign mercenaries who laid waste the land were hateful to both alike. We may safely say that, at the time of the accession of Henry of Anjou, the man of Norman descent born in England had, altogether in feeling and largely in speech, become an Englishman.

Feudal innovations of Flambard.

None of these three reigns was a time of great legislative changes, but the reigns of Rufus and Henry were the time in which the new system of administration grew up. Under Rufus the doctrine of military tenures, and of the incidents consequent on such tenures, was put into systematic shape by his rapacious minister Randolf Flambard, whom he raised to the bishopric of Durham. This man is distinctly

[2] The career of the crusader Robert the son of Godwine, whose history will be found in William of Malmesbury and in the Scottish writer John Fordun, who represents Turgot, is a case in point. So at the accession of Henry I. there were several Englishmen holding abbeys, one of whom, Godric of Peterborough, had been chosen by the monks, who paid William Rufus a large sum for leave to elect freely.

charged with having first subjected ecclesiastical property to these burdens, and there can be little doubt that it was he who laid them on lay property also. The evidence is this. Under the Conqueror we see the germs and beginnings of certain usages, but nothing more. At the accession of Henry they appear in a systematic shape as established usages, usages which Henry does not promise to abolish, though he does promise to reform the abuses of them. The feudal burdens were a logical deduction from the doctrine of military tenure. The land is held of the lord on condition of certain services being rendered. It passes from father to son; but in order that each successive tenant may strictly hold it as a grant from the lord, the heir must receive it again. For the new grant he must pay a *relief*, the price of the *relevatio*, the taking up again, of the estate which has lapsed to the lord. But it may be that the heir is from age or sex incompetent to discharge the services due to the lord. In the case of the minor heir, the lord takes the fief into his own hands till the heir is of age to discharge them. The heiress can never discharge them in person; she must discharge them through a husband. But the interests of the lord require that she shall marry only with his approval, lest she should carry the fief into the hands of an enemy. All these occasions were turned by the perverse ingenuity of Randolf Flambard into means for increasing the royal revenue. The wardship,—that is, the temporary possession of the minor's estate,—might be granted or sold. So might the marriage of the heiress. The lord might either sell her and her estate for money, or else he might take money from the heiress herself for leave to marry according to her own inclinations. So with bishoprics and abbeys; Flambard found out that they too were held of the king by military service. During the vacancy of the benefice, there was no one to discharge the service; the king therefore took temporary possession of the ecclesiastical estate. And, as the new prelate could not be chosen without the royal consent, the king might prolong that temporary possession as long as he chose. All these inferences were logically drawn out and sternly carried into practice by the minister of Rufus. The utmost that Henry pledged himself to do was to reform the grosser oppressions of his brother's reign, and to limit his exactions within some reasonable bounds. The claims themselves went on, to the oppression and sorrow of successive generations of heirs and heiresses, till, as regards lay tenures, the whole system was swept away by the famous Act of Charles II.

The laws of Henry I.

There is nothing to make us think that the innovations of Flambard were ever put forth in a legislative shape. At all events, no laws of William Rufus are extant. A book is extant which calls itself the Laws of Henry; but, like the codes called the law of Eadward and William, it is rather a private compilation or law-book. It has a certain value, as a witness to the state of the law in Henry I.'s time; but it must not be mistaken for a collection of real statutes put forth by that king. It is remarkable for the strongly English character of the jurisprudence described. There can be little doubt that the compiler purposely gave his work as English a character as he could; but there is as little doubt that Henry strove to give to his government, as far as he could, at least the appearance of an English character. In his charter he grants to his people the law of King Eadward —that is, the system of government which prevailed in Eadward's reign—with his father's amendments. And, both in the charter and in other documents of his reign, the time of King Eadward is constantly taken as the standard. Henry however kept the forests in his own hands, and preserved the stern forest law of his father. The reign of Henry is also memorable as the time of the earliest extant charters, both of the king and of other lords, granting new privileges to boroughs, often calling them into legal existence for the first time. Thus the citizens of London are exempted from various burdens of different kinds, and from the jurisdiction of any but their own courts. They have further the farm of all Middlesex—their subject district—and the appointment of their own sheriff. In the next reign or rather anarchy, the citizens of London appear distinctly as a *communio* or *commune*.

Charters to towns.

Administration of Henry.

But if this period was not marked by many formal changes in the law, the new administrative system grew stronger and stronger. If the reign of Rufus systematized the military tenures, the reign of Henry systematized the exchequer and the great offices of state. A family of able ministers begins with Roger, chancellor, justiciar, and bishop of Salisbury, a family of the secularized churchmen of that day, most of whom rose from the king's service to high ecclesiastical office. Henry, a strict administrator of justice, looked no less narrowly after his own interests. Under him we get the earliest pipe-roll of the exchequer, and a wonderful document it is, showing how many and how strange were the sources of income which flowed into the hoard of a Norman king.

Controversies of Rufus and Henry with Anselm.

These reigns are also of the highest moment in ecclesiastical history. We now see what the ecclesiastical effects of the Conquest really were. As we have seen, the tendency of the time was to make bishoprics the reward of temporal services, a practice which under Rufus easily sank into direct simony. Yet Rufus himself, in a fit of sickness and repentance, put a saint at the head of the English Church. After a vacancy of four years (1089–1093) Anselm succeeded Lanfranc in the see of Canterbury. Anselm was forced into the office; but at this stage he showed no objection whatever to the ancient English mode of investiture, by which the prelate received his staff from the king, and became his man. But, in such a reign as that of Rufus, the tendencies of such a man as Anselm could not fail to be Romewards. Rome might well seem to be the seat of law, as opposed to the *unlaw* of the reigning king. The quarrel began about the acknowledgment of a pope of disputed title; it went on about various matters, till Anselm crossed the sea to confer with Pope Urban. He remained in banishment till the death of Rufus, and learned at Bari and at Rome that the laws of England were evil, that no churchman ought to receive investiture from a lay lord or do homage to a lay lord for the lands of his church. He was recalled by Henry, and served him loyally during Robert's invasion. But he refused to do homage or to consecrate the bishops whom the king had invested. A second absence from England (1103-1106) followed, till a compromise was made between the king and Pope Paschal. The king gave up the claim to invest with the staff; but the prelate was to do homage to the king for his lands. Anselm then came back.

Growth of ecclesiastical claims.

The controversy is a memorable one, not the least so because Henry and Anselm are an almost solitary example of a king and a bishop who could each maintain claims which he held to be right without loss of temper or breach of personal friendship. Anselm was a true saint. He was no mere stickler for ecclesiastical privileges, but a denouncer of moral evil. One of his canons again denounces the slave-trade, and indeed denounces slavery itself. Yet it is plain that through Anselm the power of the Roman see in England greatly advanced, and he labored hard to forbid the English use which allowed marriage to the clergy. Under his successors the claims of Rome grew yet faster, and a succession of canons were passed against the married clergy. Under the anarchy it is not wonderful if the ecclesiastical power grew; it was the only thing in the realm which kept any likeness of law. Ecclesiastical synods took upon themselves to judge the king; and the right of succession to the English crown was argued in a solemn pleading before the court of Rome. The doctrine of clerical exemptions grew; it was held that no clerk might be tried in a temporal court for any crime whatsoever. Nothing did greater damage to Stephen than his imprisoning two bishops, the famous Roger of Salisbury and his nephew Alexander of Lincoln. On the other hand, the ecclesiastical courts continued to draw to themselves a large class of causes which concerned laymen. Nor was this in those days altogether without a good side. The bishops' courts had a bad name for corruption—that is, for letting off offenders for money. But at least they were not bloody. As they could not inflict death, so neither could they inflict the horrible mutilations which were common, even in the case of very trifling offences, in the courts of the king.

The Cistercian order.

This period was also marked by the introduction of the Cistercian order into England. Houses of this order, a reform of the older Benedictine rule, never reached the wealth and importance of the Benedictine houses; but they have added a special feature to English scenery. The monks of this order habitually sought wild and lonely spots; the ruined abbey is

The universities.

most commonly Cistercian. At the same time, we see the first beginnings of the university system in England. Oxford, a flourishing borough, a strong military post, a favorite seat of national assemblies, and an occasional royal residence, now became for the first time a seat of learning. The teaching of divinity began under Robert Pullein in the days of Henry; that of law began under Vacarius in the days of Stephen. This is really all that we know of the beginnings of that great university; but its growth must have been steady during the whole of this century; for at the beginning of the next the scholars of Oxford were a numerous and important body.

Relations with Scotland.

The relations of England to the rest of Britain are of considerable importance during this time. The marriage of Malcolm and Margaret had most important results on both countries. The Scottish kings became in truth English kings, more truly English than the Normans and Angevins who reigned in England. Their culture was English; they dwelled mainly in the English or Anglicized parts of their dominions; strangers from England of both races were welcome at their court. This English influence began under Malcolm; after a period of struggle, it became fully established under David. Malcolm invaded England more than once, both in the days of the Conqueror and in those of Rufus, and his last invasion saw also his death at Alnwick (November 14, 1093). This invasion was perhaps caused by an act of the king of the English which may well have been dangerous to Scotland. Rufus was the one king of his race who enlarged the actual kingdom of England. He made Cumberland, meaning by that name the old diocese of Carlisle, an integral part of England; he peopled it with colonists from southern England, and he rebuilt or repaired the local capital, which became a strong fortress against Scotland. After Malcolm came a time of struggles between the Scottish and the new English party in Scotland, which was ended by Eadgar, the son of Malcolm and Margaret, being placed on the throne by English help. Under his reign and those of Alexander and David (1097–1153) the relations between England and Scotland were close, and, as long as Henry of England lived, perfectly peaceful. In Stephen's day David asserted the rights of his niece the empress; he twice invaded England; he suffered a great defeat in the battle of the Standard; but he obtained the cession of the newly won land of Cumberland, and also of the earldom of Northumberland. Like Lothian at a former time, these lands were to be held as English earldoms. Their possession by the Scottish kings was short; but it doubtless tended, along with other things, to make Lothian become more directly a part of the Scottish realm.

Affairs of Wales.

Along the Welsh frontier the power of England greatly advanced under the two Williams and under Henry. We may say, roughly speaking, that South Wales was conquered at this time. But the conquest amounted to little more than the settlement of Norman lords with a following of all nations, who kept up from their castles an endless warfare against the Welsh in their mountains. But one part of the land was settled in another way. The southern peninsula of Pembrokeshire, and seemingly the peninsula of Gower in Glamorgan, were under Henry (1111) planted with a Flemish colony, which may be fairly called the last of the Teutonic settlements in Britain. In the Flemish district of Pembrokeshire the Britons and their tongue vanished as utterly as they had done from Kent. Two of the chief towns, Pembroke and Tenby, keep Welsh names in a corrupt form; the rest of the local nomenclature preserves the names of the Flemish leaders.

Reign of Henry II.

Thomas of London.

Primacy of Thomas.

His disputes with the king.

With the accession of Henry of Anjou a new period begins. The purely English period has ended. The Norman period has ended also; England and Normandy are alike under the rule of the cosmopolitan prince from Le Mans. Englishmen tried to see a native king in the man who sprang through three generations of females from the son of Eadmund Ironside.[1] And Henry was too wise to refuse to listen. Whatever he was, he was not Norman, and under him the last traces of distinction between men of English and of Norman birth in England altogether died out. Of all the kings between the Conqueror and Eadward the First, he has the best right to the name of lawgiver. He is not the author of any formal code; but he is the author of a greater number of actual enactments than any king before him. His reign falls naturally into three parts. The first is taken up with the restoration of order after the anarchy. To this work the young prince of twenty-one, who had already won a name beyond the sea, gave himself with a good will. He was helped in the work by one of the clerical statesmen of the age, Thomas the son of Gilbert Becket of London, archdeacon of Canterbury and the king's chancellor. Thomas is one of the great examples of the fusion of Normans and English. Born in London of Norman parents, he appears throughout his career as a passionate lover of his native land and his native city. He was a favorite with the English people, nor is there a word to show that he deemed himself, or was deemed by them, to be other than their countryman in the fullest sense. King Henry and Chancellor Thomas worked hard for eight years to restore the rule of law. One great difficulty in their path was the new doctrine of the immunity of the clergy from secular jurisdiction. These years were a time of comparative peace, broken chiefly by a war (1159) with Lewis of France for the succession of Toulouse. This war was, as we shall presently see, of great importance in a constitutional point of view; and in it the chancellor's functions, ecclesiastical and civil, did not hinder him from showing himself in the third character of a stout man-at-arms. At last, on the death of Archbishop Theobold (1162), Henry committed the fatal mistake of raising his great minister to the see of Canterbury, and the further mistake of expecting the new archbishop to remain his minister. The step was in every way new; other bishoprics had been used as rewards for temporal services; the primacy had been reserved, if not always for saints, at least for men whose character was not prominently worldly. Most archbishops had been monks. And though, both before and after the Conquest, archbishops of Canterbury had been rulers of the realm in more characters than one, no archbishop had ever held a post in the king's service like that of chancellor. The see was forced upon Thomas; but, once archbishop, he put on the character of his new office in all its fulness. As a mere deacon holding secular office, he had been the king's most trusty servant; now become priest, bishop, archbishop, he threw up his secular post, and became the champion of the ecclesiastical claims in their most extravagant shape. Quarrels soon arose between him and the king, quarrels which neither king nor primate carried on in the spirit of Anselm and Henry I. Thomas showed himself violent and provoking; Henry showed himself mean and spiteful. The first great quarrel arose out of the ecclesiastical claims; for Thomas, in his new position, tried to shelter even the most guilty churchman from any punishment at the hands of the temporal courts. The king caused a body of ordinances, known as the Constitutions of Clarendon, to be drawn up, which professed to state the law as it stood under Henry I. before the anarchy. They were certainly not, as the ecclesiastical party called them, innovations of his own; but it was only natural that they should seem innovations to the ecclesiastical party. There was to be no appeal to any power out of the realm without the king's special leave. As a natural consequence, the clergy were not to leave the realm without the king's license. The ecclesiastical courts were no longer to shelter offenders against the laws of the land. Advowsons were declared to be lay fees. The baronial character of the estates of bishops and abbots was distinctly asserted, and on this followed, as a logical consequence, the rule that those estates should pass into the king's hands during a vacancy. Elections of prelates were to be made in the king's chapel, with his consent. Another provision was added, not wholly new, and which hardly touched the general question, but which still marks the growth of the new ideas. The villain was not to be admitted to holy orders without the consent of his lord. The ecclesiastical legislation of Henry II. was, in fact, only a little more than a codification of the practice of Henry I.; it was only a little less than a forestalling of the legislation of Henry VIII. It contained innovations on the practice of England before the Norman Conquest; but they were the innovations of Flambard, not of Henry himself. But the attempt was premature. Thomas, in a moment of weakness, assented to the Constitutions, and then withdrew his consent. Henry, thus far in the right, put himself in the wrong by raking up all kinds of forgotten and frivolous demands against the archbishop. Thomas fled from England and found shelter in France. It was the interest of Lewis to support any enemy of Henry. A weary time of dispute and intrigue followed, in which Thomas was but feebly supported by the pope Alexander III. Henry sometimes threatened to acknowledge the imperial antipope; sometimes he forsook his own position; once, men said at the time, he went so far as himself to accept a legation from the pope. At last the first quarrel was patched up (1170). Thomas came back to England only to find a new and distinct ground of quarrel. The king had caused his eldest son Henry to be crowned by Roger archbishop of York, to the prejudice of the rights of the see of Canterbury. New excommunications, new disputes, followed. At last four knights in the king's service, mistaking a few hasty words of their master, crossed from Normandy to England, and slew the archbishop in his own church.

---

[1] See especially the dedication of the *Genealogia Regum* by Æthelred of Rievaux to Henry II. The king's pedigree is there traced up to Adam, without any reference to his Angevin father or to his Norman grandfather.

His death.

Later years of Henry.

Thomas really died for the rights of the church of Canterbury, not for any more general principle. But the second quarrel, as could not fail to happen, got mixed up in men's minds with the first; and the murdered archbishop was looked on as a saint and as a martyr to the general privileges of the church. The dead martyr was a more dangerous enemy to the king than the living primate had been. We now enter on the third period of Henry's reign, a time of nineteen years, in which Henry had to struggle against foes on every side, but chiefly against foes that were of his own household. His overlord of France, his vassal of Scotland, his own nobles, his wife and his own children, were all arrayed against him. As far as England was concernd, Henry was successful against all. The rebellion of the earls and the Scottish invasion (1174) both failed. On the continent his fate was harder. The death of his eldest son, the rebellion of the youngest, the loss of the city of his birth, utterly broke down his spirit. At the age of fifty-six he died (1189) at Chinon, far away alike from England and from Normandy, a worn-out and broken-hearted man.

Reign of Richard I.: its un-English character.

The great lawgiver was gone, and his dominions passed to his rebellious son Richard. This king has in popular belief become one of the heroes of England. That he should ever have been looked upon as such, that he should by strangers have been so looked upon even in his own time, shows how England had come to be looked on as the head and centre of the vast dominion of her kings. Personally Richard, though born on English ground, was the least English of all our kings. Invested from his earliest years with his mother's Southern dominions, Richard of Poitou had little in him either of England or of Normandy: he was essentially the man of Southern Gaul. Twice in his reign he visited England; to be crowned on his first accession, to be crowned again after his German captivity. The rest of his time was spent in his crusade, and in various continental disputes which concerned England not at all, except so far as she had to pay for them. The mirror of chivalry was the meanest and most insatiable of all the spoilers of her wealth. For England, as a kingdom, all that he did was to betray her independence by a homage to the emperor, which formed a precedent for a more famous homage in the next reign. His reign is an important one in constitutional progress, but as such it was the reign of his ministers and not of himself. One event towards the end of his reign has been often misunderstood. A commotion was raised in London (1196) by William the son of Osbert, known as William with the Long Beard, a fellow-crusader and seemingly a personal friend of the king's. William professed to be the champion of the poor against the rich. Out of this a romantic story grew that he was the champion of the English against the Normans. The writers of his own time show that he was deemed a martyr by his followers and a traitor by his enemies; but they give no hint that he was the champion of one race against another. Nor do they give us any clue as to his own descent, English or Norman. There is not a word in any writer of the reign of Henry or Richard to make us think that the distinction between the two races was at all remembered in any hostile sense. Everything shows that all the inhabitants of the kingdom were fast drawing together, in opposition to men born out of the realm, whether in Normandy or anywhere else.

Sedition of William Fitz-Osbert.

Reign of John.

Richard died, as he had lived, far away from England and Normandy, in a petty quarrel with a southern vassal (1199). Constitutional progress had gone on silently in his absence. In the next reign freedom had to be won openly from a tyrant by force of arms. No period of our history, save those of the Conversion and the Conquest, is of greater importance than the seventeen years of John. A popular confusion has to be got rid of with regard to his accession at the death of Richard. John, the youngest son of Henry, was the only survivor of his brothers; but Geoffrey, the third son of Henry, had left a son Arthur. Richard seems at one time to have designed Arthur for his successor. But his last bequest was in favor of his brother; and, even without that bequest, all English precedent was in favor of the brother rather than of the nephew. Arthur does not seem to have had a single partisan either in Normandy or in England. John was received as duke, chosen and crowned as king, without opposition. But on the continent generally the new doctrine of hereditary right had made much greater advances than it had in England. Anjou acknowledged Arthur; and Philip of France was led by an obvious policy to receive his homage for all the continental dominions of his uncle. But Arthur and his followers were soon crushed by the king-duke (1202), and the disappearance of Arthur left little room for doubt that he had been put out of the way by his uncle. The king of the French called into being a new jurisprudence out of the romances of Charlemagne, and called on the twelve peers of France to sit in judgment on their felon brother. Sentence of forfeiture of all lands held of the French crown was pronounced against John. The sentence was carried out by an easy conquest of continental Normandy. The islands clave to their duke, and they have ever since remained possessions of the English crown, keeping their local independence and their ancient laws. On behalf of the duchy John did not strike a blow; but he led more than one expedition to secure or to win back his southern dominions, and the final result was that, of all the continental possessions of Henry and Richard, Aquitaine alone remained to their successors. The relations of England to the continent were thus completely changed. Under Henry and Richard England had been only one, though the greatest, among the endless possessions of her king. Now that Normandy, Maine, and Anjou became provinces of France, Aquitaine became distinctly a distant dependency of England. To the crown of France the gain was beyond words; the king was now a greater potentate than any of his vassals. He had won back those old possessions of the French duchy which had so long cut off its dukes and kings from the sea. To England the loss was the greatest of gains. It broke the last tie which bound any part of the inhabitants of England to any land beyond the four seas of England. If anything was still wanting to wipe out every trace of distinction between the descendants of those who a hundred and forty years earlier had been the conquerors and the conquered, the French conquest of Normandy did the work. Every man in England was now an Englishman, and nothing but an Englishman. One question only has to be asked: Why did Normandy, the old foe of France, submit so tamely to a French conquest? The reason seems plain. Normandy was a conquered land. With Henry I. the line of her national dukes had ended. If the French king was a stranger, he was not more a stranger than the king of England and count of Anjou. The duchy really lost nothing by passing from a state which might seem that of a dependency, to become an integral portion, often a royal apanage, of a kingdom of its own speech. Aquitaine, on the other hand, foreign alike to England, Normandy, and France, found its account in cleaving to the more distant sovereign. The nobles were drawn to France by community of feeling in many ways; but the cities clave to the distant king, who was their ally and protector rather than their master.

Loss of Normandy.

Union of Normans and English.

The English nation was now united: the smaller mass of the conquerors had been received and assimilated by the greater mass of the conquered. Events now thickly pressed one upon another, and all of them tended to draw all the sons of the soil closer and closer together. John, like Richard, was born in England; but, like Richard, he was in feeling neither English nor Norman. He surrounded himself with foreign counsellors and with foreign soldiers.

John's quarrel with the pope.

He presently plunged into an ecclesiastical quarrel which showed the weak side of the ecclesiastical policy of the Conqueror. It needed William himself to carry out William's system. A disputed election to the see of Canterbury gave Innocent III. an opportunity for putting in a nominee of his own, and his choice—it must have been unwittingly—fell on one of the foremost of English patriots, on the first of the noble band who defied pope and king alike on behalf of the freedom of England. The candidate of the king and the candidate of the monks both gave way to Stephen Langton. John had so utterly turned away from him all the hearts of his people that none stood by him, even when the pope took upon him to declare the king of the English deposed from his crown, and to offer that crown to the king of the French. In his despair John became the man of the Roman pontiff, as his brother had become the man of the Roman Cæsar. Archbishop Stephen now came back to England. The laws of King Eadward were renewed. When John flew to arms, the barons and people of England, with the primate at their head, swore to bring back the ancient laws, the laws of Eadward, the laws of Henry. Those names are now heard for the last time.

The Great Charter.

John was constrained (1215) to sign the Great Charter; and from that day Englishmen called for the observance of the Great Charter, as they had hitherto called for the laws of Eadward. By that charter resistance to the royal power was legalized; in the struggle that followed it was the king who was the rebel. John had hardly sealed the charter, when he sent to his overlord at Rome, and the pontiff took upon him to annul the recovered liberties and to denounce suspensions and excommunications against those who had won them. At the head of his foreign mercenaries, the king laid waste his own dominions. The barons in despair chose a new king, and offered the crown to Lewis of France.

Election of Lewis.

Such a choice seems to us yet more strange than the speedy submission of Normandy to Lewis's father. That the step was most unwise was presently proved; but at the time it was intelligible alike to Normans and to Englishmen. If Lewis was a stranger, so was John. Personally Lewis promised far better than John, nor was it easy to find any other available candidate. If not Lewis himself, yet his wife, came by female descent of the royal stock; and the only likely competitor, the emperor Otto, was at once closely allied with his uncle John and had shown that he could not keep the kingdoms which he had already. But, even before John died, men began to feel that, in inviting a French king, they had invited a French conquest.

Succession of Henry III.

In a few months (1216) the death of John cut the knot; all English feeling turned to the side of his young and innocent son. He was indeed a minor, but a minor was better than a stranger. Henry III. succeeded as a national king, and a burst of national feeling drove the French out of the land. A long and weary time followed, in which the freedom of England was slowly growing up, till, fifty years later, the time came when it had to be again asserted on the field of battle.

Legislation of Henry II.

No time is richer than this in legal history. The whole reign of Henry II. was a reign of legislation, and the work was not interrupted even during the time of the great struggle with the archbishop. In the year before the promotion of Thomas to the primacy, king and chancellor had dealt one direct blow at all feudal ideas. In the war of Toulouse the *scutage* was first devised; a money payment was accepted instead of personal military service. The money was of course spent in hiring mercenaries; and it was largely by the help of mercenaries that Henry subdued his rebels in England. But later in his reign, by the Assize of Arms (1181), he regulated the old constitutional force of the country, and enjoined that every free Englishman should be ready to serve with the weapons belonging to his rank. Other incidental notices show us that much legislation was done while Henry still had Thomas to his minister. But the ordinances of which the text is preserved belong to a later time. The reign of Henry is rich in charters to boroughs, several of which are early enough in his reign to bear the signature of chancellor Thomas. And a reference in the Constitutions of Clarendon shows that, thus early in his reign, Henry had begun that great step towards the development of jury trial which is one of the special marks of his reign. By the work of Henry and his chancellor the system of recognition was organized, by which sworn men gave a verdict, but as yet a verdict given from their own knowledge. The great legal writer of Henry's reign, the justiciar Randolf of Glanville, speaks of the recognition as a special gift of Henry to his people, and enlarges on its superiority to the wager of battle. All this comes within the chancellorship of Thomas; and we shall do the chancellor great injustice if we think wholly of his later ecclesiastical character, and forget his services in the days when he was the chief minister of one of our greatest kings. Of the extant ordinances of Henry's reign, the oldest after the charter issued at his coronation are the Constitutions of Clarendon themselves (1164). The Assize of Clarendon—a wholly distinct document (1166) and the Inquest of Sheriffs (1170) came during the time of the quarrel with Thomas. On these, after the death of Thomas, follows in 1176 the Assize of Northampton, in 1181, the Assize of Arms, and in 1184 the Assize of the Forest. All these bear witness to Henry's care, even when he was most occupied with other matters, to preserve the peace of the land, and to enable all his subjects to have justice done to them in the king's name. And in all, the mode of inquisition by the oath of twelve lawful men grows at each step.

Administration of justice.

The Assizes of Clarendon and Northampton have a special reference to one of Henry's great measures, that by which the visitation of the country by itinerant judges going regular circuits was finally established. It was not an invention of his own; the visits of the king's judges had begun to take a regular shape under Henry I. But it was Henry II. who organized the whole system afresh after the anarchy. It was he who finally established the specially English principle that justice should be administered in different parts of the kingdom by judges not belonging to the particular district, but immediately commissioned by the king. When the king's judges came and received the inquisitions of the local jurors, though the complete modern ideal of a judge and jury had not been reached, yet something had been reached which could grow into that ideal without any one moment of change so great as the changes wrought by Henry himself. By him the jury was applied to all manner of purposes. The Assize of Arms was distinctly a return to the old military system. It gave a new life to the *fyrd*, the ancient militia, which had never gone out of use, but which had been overshadowed by feudal levies on the one hand and by the use of mercenaries on the other. Each man was to have the arms which befitted the amount of his property. It was by a jury that the liability of each man to be ranked in such or such a class was to be fixed. Even in the Assize of the Forest, an ordinance framed to protect the most exceptional and most oppressive of all the royal rights, the popular element comes in. Sworn knights are appointed in each shire to protect those rights. Lastly, when in 1188 the tithe was levied for the defence of Eastern Christendom against Saladin, the liability of each man to the impost was assessed by a local jury. In all these ways the appeal to the oath of lawful men, as opposed to any other form of finding out truth, was strengthened by every step in the legislation of Henry.

Henry's administrative system.

Meanwhile the administrative system which had been growing up ever since the Conquest took firm root under Henry. We have a contemporary picture of it, drawn by one of Henry's own officials, in the *Dialogus de Scaccario*. This was the work of Richard, treasurer of the exchequer and bishop of London, one of the family of officials founded by Roger of Salisbury. Alongside of this, we have our first strictly legal treatise, as distinguished from private compilations and codes, in the work of the great justiciar Randolf of Glanville. In short, we may say that under Henry the legal system of England took a shape which it has practically kept ever since. The endless changes of the last seven hundred years are rather special amendments of Henry's work than anything which can be said to start altogether afresh from a new point. Strictly constitutional advance rather belongs to the reigns of Henry's sons than to that of Henry himself. Nor is this wonderful. Constitutional advance commonly means the lessening of the royal power, and acts which lessen the royal power do not often issue from the free will of kings. In Henry's time, above all, a time when law and order had to be restored after the reign of anarchy, the momentary need was rather to strengthen the royal power than to lessen it. Legal reforms are often, as in this case, the free gift of wise kings; constitutional reforms have commonly to be wrested from weak or wicked kings. But the legal reforms of Henry supplied an element which largely entered into the constitutional reforms of the next stage. Out of Henry's favorite institution of recognitions on oath grew, not only trial by jury, but also the House of Commons.

Beginnings of representation in parliament.

By the time of Henry II. the force of circumstances, especially the working of the practice of summons, had gradually changed the ancient assembly of the whole nation into a mere gathering of the great men of the realm. The work which had now to be done, and which, in the space of about a hundred years, was gradually done by a number of instruments, conscious and unconscious, was to call into being a second and more popular assembly alongside of the assembly which had lost its popular character. To use language which belongs to a somewhat later time than that with which we are now dealing, the House of Lords already existed; the House of Commons had to be called into being alongside of it. The details of this great process of constitutional growth must be drawn out by the strictly constitutional historian. All that can be done here is to call attention to the main lines of the process and to its more remarkable landmarks. And it may be well from the very beginning to give the warning that the two Houses of the English Parliament did not arise out of any theoretical preference for two houses over one or three. The number was fixed, liked everything else in English history, by what we are apt to call circumstances or accidents. Our whole parliamentary system was eminently one which was not made, but grew. Thus, for instance, it was only gradually established that the barons should be personally summoned to the same house as the bishops and earls, while the knights should appear only by their representatives along with the smaller freeholders and the burgesses of the towns. It is in the reign of Richard I. that we begin to see the first faint glimmerings of parliamentary representation. The one object of the absentee king was to screw all the money that he could out of the kingdom for which he cared not. The object of his wise ministers, of Archbishop Hubert among the first, was to gain the greatest amount of money for their master with the least amount of oppression towards the nation. Under Hubert's administration, chosen bodies of knights or other lawful men, acting in characters which become more and more distinctly representative, were summoned for every kind of purpose. How far they were nominated, how far freely elected, is not always clear. It seems most likely that in one stage they were nominated by the sheriff in the county court, while at a later stage they were chosen by the county court itself. In other words, the principle of representation was first established, and then the next stage naturally was that the representatives should be freely chosen. Summoned bodies of knights appear in characters which are the forerunners of grand jurors and of justices of the peace. They appear also in a character which makes them distinctly forerunners of the knights of the shire which were soon to come. A chosen body of knights have to assess the imposts on each shire. From assessing the taxes the next stage was to vote or to refuse them. In 1213 the sheriffs are called on to summon four discreet men from each shire, to come and speak with the king about the affairs of the realm. When we have reached this stage, we have come very near to a parliament, name and thing.

The Great Charter.

The reign of John, in short, is marked by common consent as the time from which Englishmen date the birth of their national freedom in its later form. From his day men no longer asked for the observance of the laws of Eadward. They asked for the observance of John's own charter, which was deemed to be nothing else than the laws of Eadward in a new shape. By that charter all the great principles of constitutional government were affirmed. They were so fully affirmed as to be in advance of the age: only a few years later men shrank from affirming them again with so clear a voice. Stephen Langton doubtless saw further than other men of his day; but, if in one or two points he claimed more than his generation was ready for, the great mass of his legislation took root at once, and so prepared men for the final acceptance of all a generation or two later. The Charter is the first solemn act of the united English nation after Norman conquerors and Norman settlers had become naturalized Englishmen. Of distinction of race or law there is not a word. The one distinction drawn is that between freeman and villain, and even the villain has rights which the Charter protects. It ordains nothing new, except the temporary provisions for its own enforcement, provisions which give a legal sanction to the natural right of resisting a king who rebels against the law. Novel abuses are to be redressed; new means of redressing them are supplied; but the old law of England, the law of Eadward, the law of Henry, stands firm. But it is with the strictly constitutional provisions of the charter that we are here most concerned. Representation was already fast growing up; but it had hardly yet reached such a stage that it could be ordained in legal form. But rules are laid down out of which, even if it had not begun already, representation in the strictest sense could not fail shortly to arise. The distinction which had been growing up ever since the Conquest, and indeed before, between the *Witan* and the *Landsitting men* now receives a legal sanction. The practice of summons makes the distinction. Certain great men, prelates, earls, and greater barons, are to receive the personal summons. The rest of the king's tenants-in-chief are to be summoned only in a body. Here we have almost come to a separation of Lords and Commons. But in modern ideas those names imply two distinct houses; and it was not yet settled, it had not yet come into men's minds to consider, whether the national council should consist of one house or a dozen. But it is decreed in so many words that the acts of those who came would bind those who stayed away. On such a provision representation, and not only representation but election of the representatives, follows almost as a matter of course. The mass stay away; a few appear, specially commissioned to act in the name of the rest. The Charter mentions only the king's tenants-in-chief; so far had things been marred and feudalized by the influence of the Conquest. But as the election could only be made in the ancient county court, every freeholder at least, if not every freeman, won back his ancient right. If he could not come himself to cry Yea or Nay, he at least had a voice in choosing those who could do so with greater effect.

The power of the purse.

The point in which the legislation of the Charter seems to have been in advance of the age was with regard to the power of the purse. The old threefold burden, the *trinoda necessitas*, seems, in the new feudalized state of things, to have given way to the three cases in which the lord might lawfully call on his man for an aid. These were his own ransom from captivity, the knighting of his eldest son, and the marriage of his eldest daughter. This right is allowed to the king; but he could call for money in no other case, unless it was voted to him by the national council. This was the old law, and in quite recent times both Thomas of London and St. Hugh, the Burgundian bishop of Lincoln, had, in full assembly, withstood exactions on the part of Henry and Richard. But, though both ancient law and modern precedent were for the clause, men were not ready for the direct assertion of its principle. The clause was left out at the later confirmations of the Charter, and the right was not again fully established till the end of the century. The provisions which were temporary were not the least important. Twenty-five barons were appointed to carry them out, and, to show the advance of municipal rights, among them was the mayor of London. If the king broke his oath, they were to call the whole commons of the kingdom to their help, and to constrain the rebel king by force. When John again rebelled, his barons and people drew the sword against him, and they were but carrying out the letter of the law.

Resistance legalized.

European position of England.

The main principles of constitutional government had thus been established; the old freedom had been won back in a new shape. England was England again. But the European position of England had altogether changed. The final outcome of Norman and Angevin rule in England had been to make England a European and a continental power, holding two Gaulish dependencies, the duchy of

Aquitaine and the insular Normandy. But the vast extension of the Angevin dominions before they were thus cut short had brought England into connection with most parts of Europe. The daughters of Henry II., like the daughters of Eadward the Unconquered, were married to princes in distant lands, in Castile, Sicily, and Saxony. This last marriage, that of Matilda with Henry the Lion, gave the old connection between England and Germany a special direction.

Connection with Germany.

During the dispute with the archbishop, Henry was more than once tempted to forsake the obedience of Alexander III., and to accept the pontiffs who were successively set up by the emperor Frederick. But the Saxon marriage caused kings whose internal policy was distinctly Ghibeline to appear in foreign lands as the allies of the Guelf. Otto IV., the son of Henry the Lion and Matilda, was constantly at the court of his uncles, and he received from them earldoms and promises of kingdoms. It was in alliance with him that Englishman, German, and Fleming stood side by side when all three were overcome by the French king at Bouvines. In other parts of the empire, we find Henry seeking a wife for his son John in Savoy, and bringing a saint from Grenoble to rule at Witham and at Lincoln. But more than all, England, as a power, began at this period to take a direct share in the crusades. Individual Englishmen of both races had fought in earlier crusades, and had entered the service of the eastern emperors.

The crusades.

But Henry himself took the vow of a crusader, and Richard carried that vow into effect. In foreign lands the Poitevin count appeared as an English king, and his followers, of whatever race or speech, were looked on as Englishmen. The fame of England was thus spread through all lands; yet it was in the reigns of Richard and John that the crown of England was humbled as it never was before or since. Richard became the man of the emperor for his kingdoms; John became the man of the pope. That he also offered to become the man of the Almohade Commander of the Faithful reads almost like a piece of satire; but the evidence on which the story rests cannot be lightly cast aside.

Conquest of Ireland.

Within the island world of Britain the power of England rose for a moment under Henry II. to a greater height than it had ever risen at any earlier time. Or we might say that another island world, less only than Britain itself, was brought into relation with the world of Britain, as the world of Britain was brought into relation with the world of Europe. The first Angevin king of England became the first English lord of Ireland. The connection between the two islands had been growing close for a long time. Shadowy tales are told of a dominion exercised by Eadgar and by Cnut on the eastern shore of Ireland. It is more certain that, under the two Williams and under Henry I., first the Danish settlers, and then the Irish themselves, entered into spiritual relations with the see of Canterbury which could hardly fail to grow into temporal relations with the crown of England. One Irish king was, if not the vassal, at least the attached friend, of Henry I. One of the first acts of Henry II. was to obtain a bull from the one English pope, Hadrian IV., granting him the dominion of the island of Ireland. But the conquest of the new realm was begun only by private adventurers in 1169. For one moment, in 1171, the conquest seemed to be a reality. The Irish princes became the men of Henry, who presently granted the kingdom of Ireland to his son John. But in truth all that was done was to begin that long and dreary tale of half-conquest and local warfare which gave Ireland five centuries of greater wretchedness than England had endured in the first five years of Norman dominion. As if from a feeling how unreal the claim was, the kingly style granted to John was dropped by John himself; and, till the reign of Henry VIII., the king of England took from his precarious Irish dominion no higher title than Lord.

Relations with Wales;

On the Welsh frontier the endless warfare went on; but this cannot be called a period of conquest. The armies of Henry II. suffered at least one defeat at the hands of the Britons; and the contemporary writer John of Salisbury ventures to regret that England had not in his day a leader like Harold to guard her frontier. Under John we find the first connection by marriage between the ruling houses of England and Wales. A natural daughter of John was married to the Welsh prince Llywelyn. From this time the position of the Welsh princes changes, and they begin to play a certain part in the internal affairs of England.

with Scotland.

On the Scottish frontier Henry II. took back the earldoms of Northumberland and Cumberland, which had been yielded to David and his son.

Special submission of William the Lion.

Presently the share taken by William the Lion in the revolt of the English barons was avenged in 1174 by his defeat and captivity, and by his acknowledgment of a supremacy of an altogether new kind on the part of the English overlord. For the first time, Scottish lords as well as Scottish kings did homage to Henry; and, for the first time also, Scottish castles were placed in his hands. But when the chivalrous Richard was selling everything, he sold back these newly acquired rights. The relations in which the kingdom of Scotland, the earldom of Lothian, and the territorial fief of what we may now best distinguish as Scottish Cumberland, stood to the English crown fell back to their former state, to form materials for a great controversy a hundred years later.

Use of French as a fashion.

With regard to language, this period is one in which the use of Latin becomes universal in all public documents. There are still a few English writs of the early days of Henry II., and the first known French document comes from the hand of Stephen Langton in the year of the Great Charter. The truth is that the men of this time were so familiar with the use of all three languages, English, French, and Latin, that it is rarely indeed that any writer thinks it needful to mention which of the three a man spoke at any particular moment. But it is clear that, by the end of the twelfth century, English was understood and spoken by all classes. It is equally clear that a fashion now set in in favor of French merely as a fashion. Richard was altogether non-resident, and could have had little influence on such matters. But John, and after him Henry III., kept a foreign court in England. Though born in the land, they were far more strangers than Henry II. had been. Thus, at the very moment when French had lost its position as the natural speech of one class of the inhabitants of England, it came to the front again as a mere courtly speech, foreign to all. In short, in regard to language, as in regard to matters of fashion generally, the Norman period was succeeded by a French period.

Literature.

But neither French nor English was at this time the tongue of solid literature, as distinguished from writings which are merely popular or merely courtly. Such writings were severally English and French. But all the learned writings of a learned age were in Latin. Neither in English nor in French is there any original English history of this time, unless we except the rhyming chronicles of Wace and Benoît de Sainte More, which are writings essentially Norman, though incidentally bearing on English matters. Our Latin materials for the history of this time are abundant.

Historians of Henry II.

We have the so-called Benedict of Peterborough; we have Roger of Howden and Gervase of Canterbury; we have Ralph de Diceto and the critical William of Newburgh. The quarrel between Henry and Thomas gave rise to an endless crop of letters, lives, and documents of all kinds. The expedition of Richard I. finds its place among the histories of the crusades. And, while history was thus abundant, legend was not wanting. The actual life of Geoffrey of Monmouth belongs to the days of Henry I. and Stephen; but it was in the second half of the century that his writings began to have a lasting influence.

Legends of Arthur.

His wild fables of Arthur and earlier British kings seem at the outside to have preserved a few distorted scraps of genuine West-Welsh history. But they gave birth to a vast legendary literature, Latin, French, and English, which has done more perhaps than any other one cause to make Englishmen forget that they were Englishmen. And, besides history and legend, there was also at this time no lack of Latin literature of a more general kind, such as the writings of John of Salisbury, Peter of Blois, and the often misunderstood Walter Map or Mapes. Among many others these may pass as some of the chief; but the literature of this age, of all classes, is overflowing. Many of these writers were real scholars, well versed in both sacred and profane learning. In Giraldus we see something higher still. He was vain, spiteful, and careless of truth. But, as we see in William of Malmesbury and William of Newburgh the beginnings of historical criticism, so in Giraldus we see the first approaches to something like scientific observation alike in language and in natural history.

Transition in architecture.

In the history of art this age is one of the greatest turning-points. It is the time of transition between the round and the pointed arch, between the Romanesque and the so-called Gothic style. The richer and lighter Norman style of Roger of Salisbury was through the reign of Henry II. gradually getting still richer and still lighter. The pointed arch, first introduced in the vaults, then in the main arcades, gradually spread itself into every part of the building. The change in the form of the arch was at first unaccompanied by any change in detail; the Romanesque ornaments continued in use. Gradually they were changed for a system of ornament which better suited the new constructive forms. By the first years of the thirteenth century, the change was complete; a style all but peculiar to England, quite peculiar to England and Normandy, a style marked by the use of untraceried lancets as windows, combined with the use of purely Gothic detail, was fully developed. The stages of the change may perhaps be best studied in the churches of Canterbury and Lincoln. Along with the development of architecture, there was an even more remarkable development of sculpture. The carvers of the eleventh century and of the first half of the twelfth could hardly represent the human figure; and when they attempted foliage, as in capitals, it was rude and inartistic. The later years of the twelfth century produced capitals almost rivalling the old Corinthian types. The next generation struck out more original, but equally perfect, forms of beauty. The sculpture, strictly so called, of the thirteenth century, if it never shook itself free from a certain amount of conventional stiffness, if its artists had neither the modern artist's anatomical science nor the old Greek's familiarity with the human figure, was at least a vast advance on works of the times immediately before them. English sculpture indeed leaped in the thirteenth century to a point of excellence which it found hard to keep.

Period 1217–1340.

The next period in English history may be measured in different ways, according to the point of view from which that history is looked at. The English nation has now taken its later form. It has assimilated its Romance conquerors, and in so doing it has received a certain Romance infusion in language, laws, and manners. The connection with Normandy has made England a European power. The separation from Normandy has made England again an English power. The nation has now to struggle against a new form of foreign invasion. Englishmen, of whichever race, have to hold their own against the Poitevin and the Savoyard. They have to wage the long struggle of the thirteenth century at once against the king at home and against the pope beyond sea. This time is marked by the reign of Henry III. But the time of struggle is also a time of constitutional progress, and under Edward I. the law and constitution of England put on the essence of their later form. Here, then, in a purely constitutional view, is one of the landmarks of our history, a landmark to be placed alongside of the Conquest and the Great Charter. But our former landmarks, the Conquest, the accession of Henry II., the reign of John, were not merely constitutional landmarks, but landmarks in the history of England as a European power. This last the legislation of Edward I. can hardly be said to be. The next great European landmark is the beginning of the long wars between England and France. From the reign of John to the reign of Edward III., the foreign relations of England hold a secondary place as compared with her constitutional progress. There are frequent wars with France; but they are rather the wars of the duke of Aquitaine than of the king of England. Under Edward III. a wholly new state of foreign relations begins. The rivalry between England and France, which had grown out of the older rivalry between Normandy and France, and which had survived the separation of Normandy from England, and its union with France, now becomes, for a hundred years and more, the leading feature in English history, one of the leading features in European history. In this European aspect, the period which follows the claim of a French prince to the crown of England comes to its natural end when a king of England claims the crown of France. We take then our present start from the day when Lewis was driven out of England, and we next draw our breath when Edward III. invades France.

Reign of Henry III.

Simon of Montfort.

The reign of Henry III. was, down almost to our own day, the longest in our annals. The first forty years of it are, on the whole, the dreariest time in our history. No time of so great a length has so few events which stand out as prominent landmarks. First comes the minority of Henry, the time when, notwithstanding the vigor of the great Earl Marshal, England was largely ruled by papal legates. The homage of John had, according to feudal principles, made the pope the guardian of his minor heir; and it was not the policy of Rome to let that guardianship be a mere name. The Charter is confirmed over and over again; but, as we have seen, with the loss of some of its most important clauses. In 1227 the king declares himself of age; presently he gets rid of his great minister Hubert of Burgh; he fills the land with Poitevins and other kindred of his mother; he drives his nobles, his brother Earl Richard at their head, into discontent, and some of them into rebellion. The new struggle of Englishmen against strangers has begun. A new phase opens when help comes from the quarter from which it could least have been looked for, when Englishmen find a leader against strangers in one who was himself by birth a stranger. In 1238 Simon of Montfort first appears; he receives the king's sister in marriage, with the earldom of Leicester to which he had an hereditary claim. Suspected at first as a foreigner, the earl grows into the truest of Englishmen. A reformer from the beginning, he gradually widens his basis, till he becomes, above all men, the leader of the people. Meanwhile the king's marriage with Eleanor of Provence brings a second shoal of strangers to feed on the good things of England. A border war is waged against France with small good luck. In 1259 that war is ended by a treaty, by which Normandy is given up for ever, and the English king keeps nothing on the continent except part of the Aquitanian heritage of the elder Eleanor. Meanwhile, during part of this time, Aquitaine is placed under the rule of Earl Simon, a ruler beloved of the cities and hated of the nobles. Meanwhile pope and king are draining the wealth of the nation; but their very extortions help the growth of freedom. Parliament after parliament meets to make grants indeed, but in making grants to protect and to assert its powers. In 1256, in 1257, new entanglements, new forms of extortion arose, while Earl Richard, the one Englishman who was ever called to the throne of the Cæsars, passed into Germany to receive his almost nominal kingship. The crown of Sicily was offered by Alexander IV. to the king's younger son Edmund. More money is demanded, more money is granted; but each grant leads to a fresh demand, and at last the spirit of nobles and people is thoroughly roused. Forty-two years after the accession of Henry, we reach the first great landmark of his reign, the famous Provisions of Oxford.

Provisions of Oxford.

The barons' war.

By these provisions the royal power was practically put in commission, very much as it had been by the Great Charter in the latter days of John. It is specially to be noticed that at this stage the king's eldest son Edward, afterwards King Edward I., appears on more than one occasion on the popular side. He and Simon were for a while fellow-workers. But Henry, like John, rebelled against the provisions which cramped his power, and about the same time Edward was reconciled to his father. The matters at issue between the king and his people were now submitted to the judgment of the king of the French, St. Lewis himself. But Lewis, if a saint, was also a king. By the mise of Amiens (1274) he annulled the Provisions of Oxford, as overthrowing the royal authority; but at the same time he decreed that the nation should keep its ancient liberties. To men who held that the Provisions of Oxford were, like the Great Charter, simply a re-enactment of ancient liberties, such an award seemed inconsistent on the face of it. There was now no hope but in arms. The civil war now begins; Earl Simon, a stranger by birth, is the leader of the barons and people of England. King Richard of Germany, who once seemed destined to hold the place which Simon had come to hold, was now fighting on the side of his brother and fellow-king. So were the two kings' sons, Edward of England and Henry of Germany. Kings and kings' sons were overthrown at Lewes (May 13, 1264), and the royal authority passed into the hands of the earl. By him, early in the next year, was held the great Parliament, the first to which representatives of the boroughs were summoned along with prelates, earls, barons, and knights of the shire. But quarrels presently arose between Earl Simon and his fellow barons. Edward, kept for a while in ward with his father, escaped and gathered an army. In the fight of Evesham (4th August, 1265) Simon was overthrown and killed, and was canonized, not by the Rome which he had always withstood, but by the popular voice of England. The war lingered at Simon's castle of Kenilworth, and, as in the days of Hereward, in the marshes of Ely. Peace was at last made (1267); and the terms on which it was made, and the generally conciliatory character of Edward's policy towards the vanquished, already showed how much he had learned from the uncle who had fallen before him, but whose work he was destined to bring to perfection. The peace of the last few years of Henry's reign seems wonderful after the storms which had filled up the greater part of it. Edward could leave the land in safety to go on the crusade; and, when his father died (1272) in his absence, his succession to the crown was at once recognized and his peace proclaimed. To say that he was the first king who reigned without election is almost a question of words. At no time in our history would there have been, in such a case as this, any chance of opposition to the eldest son of the last king. What really shows how fast the new ideas of kingship had advanced is the fact that Edward reigned for nearly two years without coronation. Henry died November 16, 1272. The reign of Edward was held to begin with his proclamation four days later; the doctrine that the king never dies is a later device still. Edward was then in Sicily, nor was his return a hasty one. He passed leisurely through several parts of Europe; he suppressed disturbances in his duchy of Aquitaine, and was crowned seventeen days after his arrival in England (August 19, 1274). Nothing could show more clearly than this how fast the office conferred by election and coronation was passing into the possession handed on by simple hereditary succession.

Accession of Edward I.

Reign of Edward.

The reign of Edward which thus began is one of the most memorable in the whole course of English history. It is more than an accident that he was the first king since the Conquest who bore one of the ancient kingly names. Under him we feel at once that the work is done, that all traces of conquest, all traces of distinction of races, have passed away. We have again an united English nation, under a king English in name and in heart. For the first time since the Norman came, England has a king whose whole policy is thoroughly English, whose work seems in so many ways a falling back on the work of the old native kings, specially of the king whose name he bore. For the first time since the Conquest, we have a king who is neither surrounded by foreign favorites nor has his policy directed to foreign objects. As duke of Aquitaine, Edward could not avoid wars and controversies with France; but wars and controversies with France were in his days something altogether secondary. His objects were those of the old West-Saxon kings, to be the lawgiver of England, and, as far as might be, to make England co-extensive with Britain. Still, like some other kings, Edward has been misunderstood through not attending to the chronology of his reign. His Scottish warfare, which is perhaps the first thing which is suggested by his name, takes up only the last nine years of a reign of thirty-five. He had been king nineteen years before the controversy as to the Scottish crown arose. So in the earlier part of his reign the Welsh warfare, which in the popular conception stands alongside of the Scottish warfare, has very much the air of an episode in a time mainly given to internal legislation. The reign naturally falls into two divisions. In the first, from 1272 to 1291, internal affairs are most prominent, though it also takes in the conquest of Wales and some important dealings with France. In the latter part, from 1291 to 1307, Scottish affairs are, or seem to be, predominant. And yet it is during this time that the greatest constitutional step of all is taken, and that parliament distinctly assumes its later form.

Conquest of Wales.

The immediate occasions of the Welsh war arose out of the disputes of the last reign. The Welsh prince Llywelyn, who still held the north-western part of Wales by the title of Prince of Aberffraw and Lord of Snowdon, had been allied with Simon; his subjects had shared in the earl's warfare, and he was himself betrothed to the earl's daughter. Disputes arose out of Llywelyn's refusal to meet the English king and do his homage. In 1276 he was declared to have forfeited his fiefs, and in the next year he was constrained to surrender the eastern part of his territory and to do homage for the rest. In 1282 a revolt began, in which David, the brother of Llywelyn, who had been hitherto in Edward's favor and was enriched with English honors, seized the castle of Hawarden and massacred all who were in it. The revolt was put down; the land was speedily conquered; Llywelyn died in war; his brother was put to death as a traitor. The part of Wales which had thus far kept its separate being as a vassal state was now forfeited to the overlord. Throughout a great part of the land English law was introduced. Shires, with their system of administration, were formed; boroughs were founded; castles were built to keep down the malcontents. The principality was designed to form a separate apanage for a younger son of the English king; but, as Edward, the first English prince, succeeded to the crown by the death of his elder brother, the title of Prince of Wales has since commonly been borne by the eldest son of the English king. The Welsh revolted again, even in Edward's own time; but their revolt was only for a moment. Later revolts were of importance only when the malcontents contrived to connect themselves with English rebels or with foreign enemies of England. The general tendency of things was to closer union between the kingdom and the principality, down to the complete incorporation of Wales with England in the sixteenth century.

Fourteen years passed between the conquest of Wales and Edward's first warfare with Scotland. In this interval much of the legislation of Edward's reign went on. He visited Gascony, and confirmed his power there; and in 1290 he freed England from the presence of the Jews. The next year began those negotiations with Scotland which led to war between the two kingdoms of Britain, to the momentary conquest of Scotland, and to its final independence.

Position of the several possessions of the Scottish kings.

Rightly to understand this great controversy, we must look back to the older relations in which the various possessions of the Scottish crown stood to the crown of England. These were three-fold. Between Scotland proper and England the relation was that degree of dependence, whatever it might be deemed to be, which arose out of the old commendation to Edward the Elder. The special burdens imposed by Henry II. had been withdrawn by Richard. Over Scotland proper the utmost claim that could be made was that of a mere external supremacy, a supremacy older than the feudal law and undoubtedly carrying with it none of the recently devised feudal incidents. Scottish Cumberland, on the other hand, was a territorial fief in the strictest sense, though again a fief older than the later feudal jurisprudence. Lothian or northern Northumberland was in strictness an earldom within the English kingdom, just as Northumberland in the latest sense was when that earldom too came for a while into the hands of the Scottish kings. Here then, in strictness, were three distinct relations for three different parts of the Scottish dominions. But it had never been the interest of either side to define the claims very strictly. As long as the two kingdoms were at peace, as they had been through a large part of the twelfth and thirteenth centuries, the English king had been satisfied to receive the homage of the Scottish kings, without defining very strictly for what territories or on what terms it was rendered. In any case, English interference in the internal affairs of any part of those dominions was unknown. The distinction between the different tenures of Scotland, Strathclyde or Cumberland, and Lothian, passed out of sight. It was remembered on the English side that some kind of homage was due from all. It was remembered on the Scottish side that the kingdom of Scotland at least was no territorial fief of the crown of England. But while the relations of the two kingdoms were in this uncertain state, the whole feudal jurisprudence had grown up, and neither side could any longer look on the matter in its strict historical bearing. The different tenures of different parts of the Scottish dominions were forgotten on both sides, and the question finally took the shape, Are the Scottish dominions, as a whole, a fief of the English crown or not? It was hardly possible that the question should take any other form; yet such a form altogether confused ancient rights and distinctions. In claiming the ordinary superiority of a feudal lord over the whole Scottish dominions, Edward claimed more than his historic right over the kingdom of

Scotland. He claimed less than his historic right over the earldom of Lothian. But the confusion was natural and unavoidable. It was only according to the ordinary workings of human nature, that the full feudal claims should be asserted on the one side, and that, on the other side, the only question should seem to be between accepting or denying them in their fulness. But it is eminently characteristic of Edward's mind that, while his evident policy was to seize every opportunity for bringing the whole of Britain into a more perfect union, he should take care to be guided throughout by the rules of at least a formal justice.

The disputed succession; award of Edward.

Division of feeling in Scotland.

His first attempt to unite the kingdoms was by the obvious means of a marriage between his son Edward and the Scottish queen Margaret. This scheme was put an end to by the young queen's death. Then came the disputed succession, a dispute which Edward was in 1291 called on to decide. Such an opportunity was not to be lost; Edward demanded to be first of all formally recognized as superior lord of the crown which he was called on to dispose of. He was so recognized; the claims of the competitors were fairly heard before a mixed commission; and the judgment given was strictly according to the laws of hereditary succession, as they were now beginning to be understood. The question between John Balliol and Robert Bruce was a question between primogeniture and nearness of kin. That question was in truth settled by the decision in favor of Balliol. The crown of Scotland was assigned to the candidate to whom it would have passed by the later law either of England or of Scotland. The decision in truth created that later law. The new King John at once entered into a relation of homage which involved a more complete dependence on England than any Scottish king had ever before acknowledged. But, though it was to Edward's manifest interest to have three weaker vassals rather than a single powerful one, he at once rejected the demand of Bruce and Hastings that the kingdom should be divided. It must be remembered that all three competitors, Bruce no less than Balliol and Hastings, though they held Scottish estates and came by female descent of the Scottish royal family, were essentially English barons, who felt no kind of degradation in a renewed homage to their own king. But it is plain that they did not carry with them the general feeling of what we must now begin to call the Scottish people. The older names of things are now strangely reversed. The English of northern Northumberland, so long under Scottish rule, had adopted the Scottish name, and had learned to feel a national patriotism, distinct from, and even hostile to, southern England. They were the Scots from whom the English kings had to endure so stubborn a national resistance. The true Celtic Scots, the men of the Highlands and islands, had in truth but little to do with the matter. Whenever they had any share in the disputes of the time, dislike to the king of Scots, the nearer enemy, commonly drove them to the English side.

Reign of John Balliol.

Edward's conquest of Scotland.

In 1292 John of Balliol received the Scottish crown as a vassal of England. A claim which we may be sure was without precedent, but which was strictly according to the rules of the feudal jurisprudence which had grown up, was before long brought to bear upon him. From the courts of the vassal there was, according to that jurisprudence, an appeal to the courts of the lord. Scottish subjects, dissatisfied with the justice which they got in the courts of King John, appealed to the courts of King Edward. Just as in the case of the arbitration, an opportunity was thrown in Edward's way, of which it was not in human nature to refuse to take advantage. John, having acknowledged himself a vassal, refused to do what was now held to be a vassal's duty. He was presently found to be negotiating against his lord with that lord's foreign enemies. That war followed was not wonderful; that, when John renounced his allegiance, he was held to have forfeited his fief was according to received feudal notions. The fief was forfeited; the kingdom was conquered; the separate kingdom of Scotland was abolished; it was incorporated with England, and was meant to have some share of representation in that parliament of England to which Edward had just given its perfect form. In 1304 the whole island of Britain, so far as its most northern parts could be said to be under the obedience of any one, was under the obedience of the English king.

Estimate of his conduct.

William Wallace.

In all this Edward simply acted as any man would act in his view of the case. He carried out the law as he understood it. There is thus far nothing to wonder at, nothing to blame. On the other hand, that the mass of the Scottish people—defined as above—should resist his claims was as little to be wondered at, as little to be blamed. Each side acted according to the ordinary workings of human nature in their several positions. The real greatness of William Wallace is shown in the fact that he was essentially a popular leader, one who kept up the heart of a nation whose natural chiefs had forsaken it. On the other hand, even setting aside the charges of special cruelties, William Wallace could not fail to seem, in the eyes of Edward and of every Englishman, a rebel who had despised the offers of mercy which were accepted by every one else. That an English court condemned him as a traitor was in no way wonderful, in no way blameworthy; that Scottish patriotism revered him as a martyr was as little wonderful, as little blameworthy.

This first war of Edward with Scotland thus began with the taking of Berwick in 1296, and ended with the taking of Stirling in 1304. Meanwhile Edward was engaged in disputes and warfare with France, which began at nearly the same time as the Scottish war. The points in controversy between France and England supply a striking and instructive parallel to the points in controversy between England and Scotland.

Analogies between the Scottish and French disputes.

As the king of Scots was the man of the king of England, so was the duke of Aquitaine the man of the king of the French. In both cases the vassalage was older than the new feudal jurisprudence. But the doctrines of that jurisprudence now began to be pressed against Edward himself. A quarrel arose between Gascons, subjects of Edward, and Normans, now subjects of Philip of France. The quarrel grew into a war which was waged by the subjects of the two kings without any commission from their respective sovereigns. Edward, summoned to appear in the court of his lord to answer for the doings of his subjects, did not deny his obligation, though he appeared only by deputy. Presently his duchy was declared forfeited, by a process which in England at least was deemed unjust; and it was in the end recovered only by a negotiation and arbitration and a double marriage. In this war, as in earlier French wars, England had the alliance of Germany and of Flanders. And, as the same years saw the beginnings of the long alliance between Scotland and France, we may say that we have come to the beginning of European arrangements which lasted till very modern times.

War of Robert Bruce.

Death of Edward I.

The second Scottish war, the war of Bruce, was quite distinct from the first, the war of Wallace. The interval which divides them is short; but the change of circumstances was enough altogether to change the conduct of Edward. As long as the war took the form of resistance to the establishment of his authority, his general clemency was remarkable. Severity began only when the war took the form of revolt against established authority. The conquest of Scotland had been completed in 1304. Robert Bruce, the grandson of the original competitor, having lost all hope of Edward's favor by the murder of his rival John Comyn, revolted and assumed the Scottish crown in 1306. In the next year, 1307, the cause of Bruce seemed again altogether hopeless, when things were changed by the death of Edward on his march to Scotland. With the single exception of the execution of Wallace, the whole of Edward's acts of severity in Scotland come within a single twelvemonth, from July, 1306, to July, 1307. After the death of the great king and the accession of Edward II., the war naturally lingered; it was interrupted by truces; and a series of successes on the part of Robert Bruce was crowned in 1314 by the overwhelming defeat of the English at Bannockburn. Then comes, from 1315 to 1318, the attempt to establish Edward Bruce as king of Ireland. For ten years follows a time of truces and of occasional invasions on both sides, till, after Edward had been deposed in 1327, a peace between Scotland and England was concluded in the next year, by which the independence of Scotland was fully acknowledged. The old claims, of whatever kind or over whatever territory, must be looked on as being from this time definitely given up. Scotland, in the sense which the word then bore, a sense which, with the exception of

Independence of Scotland.

the fluctuating possession of Berwick, is the same which it bears still,[1] must be looked on from henceforth as a kingdom absolutely independent of England. To carry on the analogy already drawn between the relations of Scotland to England and those of Aquitaine to France, the treaty of Northampton in 1328 answers to the treaty of Bretigny thirty-two years later.

Reign of Edward II.

The change in the fortune and character of the war with Scotland which followed when Edward II. succeeded Edward I. was only part of the general change which naturally followed on such a change of sovereign. The ruler, lawgiver, and conqueror had passed away, to make room for a son who inherited none of these characters. Legislation and conquest come to an end; constitutional progress becomes indirect. Edward II. was ruled by favorites; that his earliest favorite, Piers Gaveston, was a foreigner from Gascony doubtless tended to increase the usual dislike to favorites; but the fact was no longer of the same political importance as the predominance of foreign favorites had been in earlier times. There was no longer any fear of England again becoming the prey of the stranger. Still, the reign of Edward II. is, in some respects, a repetition of the reign of Henry III. The national dislike to the favorite led to an opposition to the king, which in 1310–1311 brought about the practical transfer of the royal power—in imitation, it would seem, of the Provisions of Oxford—to a body of prelates and barons, called the Ordainers. The almost immediate recall of Gaveston, in defiance of the new ordinances, led to a new Barons' War, in which the king's cousin, Earl Thomas of Lancaster, appears rather as a parody than as a follower of the great Simon. We now reach the beginning of a series of political executions which have no parallel in earlier days, but which from this time disfigure our history for many centuries. The first blood shed was that of Gaveston himself, in 1312. It was avenged ten years after by the execution of Thomas of Lancaster. Meanwhile the strife between the king and his barons had gone on. A second time, in 1318, the royal power was transferred to a council. Then came the choice of new favorites, the Despensers, father and son. They were at least Englishmen, bearing a name which had been glorious in former civil strife. But they were no less hated than the stranger Gaveston. In a moment of recovered power on the king's part follows the execution of Earl Thomas, a martyr in the belief of his party no less than Simon himself. Presently Edward has to meet with foes, not only in his own house but in his own household. Dark and mysterious causes drew on him the deadly hatred of his own wife, and gave him a rival in his own son. In the revolution of 1326, the queen is the leader; the favorites die in their turn the death of traitors. The year 1327 opens with the practical assertion of the highest right which the national council in its new form had inherited from the earliest times. By a solemn vote of the parliament of England, the king was deposed, and his own son Edward was placed on the throne. In earlier times the deposition of a king in no way implied his murder, any more than the fall from power of a great earl or prelate implied either his murder or his legal execution. But the days of blood had now set in; before the end of the year the deposed king died by a foul assassination. The new king was still a minor, and the first years of his reign were the reign of his mother Isabel and her favorite Roger Mortimer. Another revolution was needed to break their power. In 1330, with the execution of Mortimer and the imprisonment of Isabel, the real reign of Edward III. begins. And within a short space the struggle with Scotland has again begun, to be merged in a few years in the long abiding struggle between England and France.

Deposition of Edward II.; his murder.

Reign of Edward III.

In a constitutional point of view, as well as in many others, the period which we have just gone through may be deemed the most important of all periods in English history. It is the time during which our nation, our laws, our language, finally assimilated whatever was to be assimilated of the foreign elements brought in by the Norman Conquest, and finally threw off whatever was to be thrown off. At the beginning of the period we saw the English nation debating between an Angevin and a French king. At the end of it England, as England, is a great European power, waging war on the continent for the conquest of France. So it is with everything else. It is during this time that most of the things which go to make up the national life put on their later form. Above all things, this was the case with the great council of the English nation. It is for constitutional historians to trace the minuter details; the main outline may be traced in the assemblies of the reigns of Henry III. and Edward I. The name of the assembly had hitherto been fluctuating. During this period the name of *Parliament* became finally established. The name is a translation of an Old-English phrase. The Conqueror is said in the English Chronicle to have had "very deep speech with his Witan." This deep speech, in Latin *colloquium*, in French *parlement*, was the distinguishing feature of a meeting between king and people; in the end it gave its name to the assembly itself. The constitution of the assembly, as defined in the Great Charter, did not absolutely imply representation; but it showed that the full establishment of representation could not be long delayed. The work of this period was to call up, alongside of the gathering of prelates, earls, and other great men specially summoned, into which the ancient Witenagemót had shrunk up, another assembly directly representing all other classes of the nation which enjoyed political rights. This assembly, chosen by various local bodies, *communitates* or *universitates*, having a *quasi* corporate being, came gradually to bear the name of the *commons*. The knights of the shire, the barons, citizens, and burgesses of the towns, were severally chosen by the *communa* or *communitas* of that part of the people which they represented. We thus get the two houses of Lords and Commons, of which we have seen foreshadowings getting more and more clear from the days of the Conqueror onwards. But it was only gradually fixed that the members of the national council should sit in two bodies, and not in one or in more than two. The notion of local representation, by which shires and boroughs chose representatives of their own communities, had to some extent to strive with another doctrine, that of the representation of *estates* or classes of men. The thirteenth century was the age when the national assemblies, not only of England but of most other European countries, were putting on their definite shape. And, in most of them, the system of *estates* prevailed. These in most countries were three—clergy, nobles, and commons. By these last were commonly meant only the communities of the chartered towns, while the *noblesse* of foreign countries answered to the lesser barons and knights who in England were reckoned among the commons. The English system thus went far to take in the whole free population, while the estates of other countries, the commons no less than the clergy and nobles, must be looked on as privileged bodies. In England we had in truth no estates; we had no nobility in the foreign sense. Such a nobility was inconsistent with the institution of peerage, which gradually grew out of the practice of personal summons. The English peerage is strictly official. Two official classes, bishops and earls, have always kept their right of personal summons. With regard to others, both lay barons and churchmen under the rank of the bishops and chief abbots, it is plain that in the early parliaments the king summoned very much whom he would. It was only gradually that the right of summons was held, first to be vested for life in every man who had once been summoned, and afterwards to be hereditary in his descendants. Thus was formed the House of Lords, consisting of certain lay members succeeding by hereditary right, and of certain heads of ecclesiastical foundations. The office of the peer, the office of legislator and judge, passes by hereditary succession in the one case, by ecclesiastical succession in the other. The holder of the hereditary office was gradually clothed with various personal privileges, but his children remained unprivileged members of the general body of the commons. So far as nobility exists at all in England, it is confined to the person of the peer for the time being. But in truth there is in England no nobility, no estate of nobles, in the continental sense of those words.

Name of *Parliament*.

Origin of the Commons.

Doctrine of *estates*.

Nature of the peerage.

Phrase of *Three Estates*.

Yet the continental theory of estates so far worked in the development of our parliamentary system that the "Three Estates of England" became a familiar phrase. It was meant to denote the lords, the commons, and the clergy in their parliamentary character. For it is plain that it was the intention of Edward I. to organize the clergy as a parliamentary estate, alongside the lords and commons. This scheme failed, mainly through the unwillingness of the clergy themselves to attend in a secular assembly. This left, so far as there were any estates at all, two estates only, lords and commons. This led to the common mistake—a mistake of respectable antiquity—of fancying the three estates to be king, lords, and commons. The ecclesiastical members of the House of Lords kept their seats there; but the parliamentary representation of the clergy as an estate came to nothing. So far as the clergy kept any parliamentary powers, they exercised them in the two provincial convocations. These anomalous assemblies, fluctuating between the character of an ecclesiastical synod and of a parliamentary estate, kept, from Edward I. to Charles II., the parliamentary power of self-taxation. For a long time lords and commons taxed themselves separately. So did the clergy; so sometimes did other bodies. It was only very gradually that the final constitution of parliament was settled. That the barons should sit with the bishops and earls, that the citizens and burgesses should sit with the knights, were points which gradually settled themselves. And more than once things looked as if, besides separate assemblies of the clergy, we might have had also separate assemblies of merchants and of lawyers. The great fact is that, while at the beginning of the thirteenth century the name and the constitution of the national assembly were still unsettled, at the beginning of the fourteenth century we had a regular parliament of Lords and Commons. The chief point which still remained unsettled was the position of the estate of the clergy.

---

[1] That is, as regards the English frontier. The relations between Scotland and the Scandinavian islands do not concern English history.

Assemblies under Henry III.

Popular element.

Parliament of 1265. Representatives of the boroughs.

This seems to be the general result of the constitutional growth of the thirteenth century, as traced out by our great constitutional historian. Leaving the minuter details, we may here mark some of the chief steps in the progress. During the reign of Henry III. assemblies were constantly held, and their constitution is often vaguely described. But in a great many cases phrases are used which, however vague, imply a popular element. We read of knights, of tenants-in-chief, of freemen, sometimes even of freemen and villains, sometimes, more vaguely still, of "universi," "universitas Angliæ," and the like. In some cases we are able better to interpret these vague phrases. For instance, in 1224, each shire sends four knights chosen by the "milites et probi homines." Whether these knights were or were not to vote along with the magnates, they were at all events to transact business with them. We must always remember that in these times formal voting in the modern sense is hardly to be looked for. In 1254 we have a distinct case of two knights summoned from each shire by royal writ. In the Oxford parliament of 1258 four knights are ordered to be chosen in each shire, who are to report to another parliament within the same year. At that parliament they seem to appear by the title of "Communitas Bachelariæ Angliæ." It may be doubted whether this is strictly a case of the knights acting as part of the parliament. Still every instance of the kind must have helped to strengthen the growing doctrine of representation. From this time the attendance of elected knights seems to be fully established, and along with the knights we find in many cases distinct representatives of the clergy. It is in Earl Simon's parliament of 1265 that we first find distinct representatives of the boroughs. Each county sends two knights, each city or borough two citizens or burgesses, and the Cinque Ports four each. But this same parliament shows how fluctuating the practice of summons still was. The earl, strong among the clergy, strong among the people at large, was much less strong among the great men of the realm. Besides summoning the citizens for the first time, he summoned a crowd of churchmen, regular and secular, greater than appeared in any other parliament. But he summoned only five earls, including himself, those, namely, whom he could trust. We should call such a body a packed parliament; but for a long time every parliament was a packed parliament. That is to say, some barons, some abbots, were always personally summoned, some towns were always called on to send representatives; but the barons, the abbots, and the represented towns were by no means the same in every parliament. This kind of irregularity is always found till institutions have finally stiffened into some particular shape. Our whole law and constitution rests far more on precedent than on formal enactments, and in unsettled times precedents are slow in establishing themselves.

Parliaments of Edward I.

The parliament of 1265 was the model parliament, the assembly whose pattern, in its essential features, set the standard which was in the end followed, and which has lasted till our own time.[1] But the pattern which it set did not become the invariable rule till the great parliament of 1295. In the earlier parliaments of Edward I. the knights and citizens are often mentioned; but, on the other hand, we meet also with the same vague descriptions as in earlier times. But in 1295 Edward definitely adopted the model which Simon had set him, and the summoning of knights, citizens, and burgesses, though with great irregularity as to the places from which representatives were summoned, has ever since been the rule. It was thus under Edward I. that parliament finally put on the essentials of its present form. But we must still allow for irregularities in practice. It does not follow that every enactment was always passed with the consent of all the classes of which the parliament was made up. A doctrine had come in that the king was the legislator, that the votes of the parliament, or of any part of it, were petitions which he could accept or reject, or again that he might legislate on a petition from one house or branch of the assembly apart from the others. The national council had now won back its ancient constitution as an assembly of the freemen of the realm, either personally or by representation. But it was only step by step that it won back the full powers of the ancient Witenagemót. There are some indeed which it still shrinks from exercising directly, some which it shrinks from exercising at all.

Legislation under Henry III.

The reign of Henry III. was a reign of constant parliamentary action, but it was not a time rich in legislation in the strictest sense. The most direct case of change in the law during Henry's reign was the abolition of the ordeal at its beginning. This led incidentally to further changes in judicial procedure, and it is one of the chief landmarks in the development of the jury system. But it is in itself not so much independent legislation as the application to England of a decree of a General Council of the church. In short the parliaments of Henry III. are less famous for changing the law than for refusing to change it. The famous saying "Nolumus leges Angliæ mutari" dates from the council of Merton in 1236, when the barons refused to agree to the proposal of the prelates for assimilating the law of England to the civil and canon law in the matter of children born before wedlock. By the former systems of jurisprudence, the subsequent marriage of their parents admitted them to the rights of legitimate birth. But the barons chose to maintain the harsher rule of the common law of England.

Parliamentary growth under Henry III.; power of the purse.

But, if the reign of Henry III. was not a time rich in legislation, it forms an important stage in the growth of our parliamentary life. The chief work of that reign was that the first steps were taken towards the practical establishment of the doctrine set forth in the omitted clauses of the Great Charter, the doctrine, in modern phrase, that the power of the purse belongs to parliament. In Henry's day England and her parliament had to wage a never-ending strife against her two enemies, king and pope. The main duty of the nation was to withstand the extortions of both alike. The king was always asking for money; the conditions of a grant commonly were that the charters should be again confirmed and be better observed.

---

[1] In the great political poem which forms the manifesto of the patriotic party are two lines which have been often quoted:—

> "Igitur communitas regni consulatur,
> Et quid universitas sentiat, sciatur."

But what follows shows that the duties of a popular assembly were held to be, not to enact new laws, but to declare the old ones, and to procure their better observance:—

> "Cuï leges propriæ maxime sunt notæ,
> Nec cuncti provinciæ sic sunt idiotæ,
> Quin sciant plus cæteris regni sui mores,
> Quos relinquunt posteris hii qui sunt priores.
> Qui reguntur legibus magis ipsas sciunt;
> Quorum sunt in usibus plus peritæ fiunt,
> Et quia res agitur sua, plus curabunt,
> Et quo pax adquiritur sibi procurabunt."

And gradually another demand arises, that the great officers of state shall be appointed, if not by parliament, at least with the assent of parliament. But demands like these, demands for the removal of aliens and the like, are all demands for the reform of abuses and the execution of the old laws; new laws are never asked for. The Oxford Provisions of 1258 show the ideas of reform which were then entertained; it is not legislation, it is reform of bad administration, even at the cost of transferring the king's authority to other hands, which is asked for. Simon himself, the greatest of constitutional reformers, was not a legislator. His parliament is famous, not for anything that it did, but for what it was. Nor after Simon's fall do we meet with much legislation strictly so called. The ordinances of Kenilworth and Marlborough are ordinances for the settlement of the kingdom, ordinances for the better observance of the Charter and of the statutes of 1259. They are not legislation in the strictest sense, the enactment of absolutely new laws.

Legislation of Edward I.

On the other hand, the reign of Edward I., like the reign of Henry II., is emphatically a time of legislation strictly so called, as well as of constitutional progress. At no time were so many memorable statutes passed. Edward's first great act, the first Statute of Westminster, in 1275, has been described as "almost a code by itself." But it was followed almost yearly by enactment upon enactment. The statute *de religiosis* in 1279 forbade the alienation of lands in mortmain without the consent of the superior lord. Ten years later, after a mass of legislation in intermediate years, came the statute *quia emptores*, which forbade subinfeudation. The holder of land could no longer grant it to be held of himself; he could alienate it only so as to be held of the higher lord by the tenure by which he held it himself. Other statutes regulated the local administration, the range of the ecclesiastical courts, almost every detail of English law. At last, in 1297, the famous *Confirmatio Cartarum* was wrung from the king; the power of arbitrary taxation was surrendered; no tax is any longer to be levied by the king without parliamentary sanction. That is to say, those clauses of the great charter which were left out in the confirmations under Henry III. were now restored and put in force. As in all other things in these ages, we must allow for what seems to us amazing irregularity of practice. It does not follow that, because a certain course was ordained by law, therefore the law was always carried out. But the principle was established, and it could always be appealed to in case of any breach of the law. By the end of Edward's reign, a national assembly, composed of much the same elements of which it is composed still, was acknowledged to possess what is practically the greatest of parliamentary powers.

Confirmatio Cartarum.

Parliamentary power of taxation.

The extreme legislative activity of this reign is one of many signs that the immediate effects of the Norman Conquest had now quite passed away. A thoroughly united nation, which had forgotten the foreign origin of certain classes of the nation, could bear to have new laws enacted, to have old institutions put into new forms. But the particular form which the great constitutional triumph of this reign took looks both forward and backward. It looks forward, as showing that we have reached what is really modern history. The parliamentary power of the purse is the ruling principle of all later constitutional struggles. But it also looks backward. An ancient Witenagemót possessed the power of the purse, like all other powers. But in those days the power of the purse was a power of secondary importance. In early times taxation never holds the same prominent place in politics which it does afterwards. But the rule of a series of kings in whose eyes kingship was rather a possession than an office, in whose eyes the kingdom was an estate out of which they had to squeeze the greatest possible income, had made it the most needful thing of all to check the king's power of taking his subjects' money. From this time each parliamentary struggle takes the form of a bargain. The king will redress such and such a grievance, if he receives such and such a grant. By constantly pressing this new power, parliament, and above all that house of parliament in which the power of the purse came to be specially lodged, has gradually won back the powers of the older assemblies. It no longer in form makes war and peace, or elects and deposes kings. It does not even in form elect or depose their ministers. But the body which can grant or refuse the means of carrying on the machinery of government has gradually come to have, in an indirect way, the powers of government once more in its own hands.

Use of French in public acts.

Another sign that the remembrance of old wrongs and old distinctions of race had passed away is supplied by a feature of these times which at first sight might seem to prove the contrary. The reigns of the first two Edwards are exactly the time when the French language was most universally in use as the language of public acts. From this time the laws of England begin to be written in French. The truth is that the predominance of French at this period is no direct tradition of the days of the Norman Conquest. It is simply a sign of the fashion which made French to be looked on as the most polite, as it certainly was the most widely spoken, of Western languages. It was merely a fashion; Edward and his nobles knew and spoke English thoroughly well[1] But the fact that such a fashion could take root showed that the use of the French language had ceased to call up any memories of the conquest of England by men whose tongue was French. If the use of French called forth any hostile feelings on the part of Englishmen, it was now, not as the speech of a forgotten conquest in their own land, but as the speech of a rival nation beyond the sea. And when French had come to be used simply as a matter of fashion, its supremacy was doomed; in the course of the fourteenth century, English, modified as it was by the indirect effects of the Conquest, gradually won back its old place as the dominant speech of England.

Patriotic churchmen.

This age, so great in our political history, is of equal importance in the intellectual and religious development of England. It was an age when difference as to theological dogmas was still unknown in England, but when a strong national opposition was growing to the exactions and oppressions of the see of Rome. In the thirteenth century there is no sign of any revolt against the national Church; the nation and the national Church are one in opposition to the foreign enemy. The most remarkable feature of the reign of Henry III. is the union of all classes, barons, clergy, and commons, in the common struggle against pope and king. The series of patriot prelates which begins with Stephen Langton is carried on in Archbishop Edmund the saint—in Robert Grosseteste, saint, scholar, and philosopher—in Walter of Cantelupe, a statesman of a Norman baronial house. The first signs of any jealousy felt towards the national clergy do not begin till the great national strife is over, and till some at least of the English prelates had given in to the new-fangled teaching at Rome. When at the papal bidding the English clergy refused for a moment to contribute to the needs of the English state, the great Edward found the means to put them beyond the pale of English law.

The friars.

The intellectual activity of the thirteenth century, the great creative and destructive century throughout all Europe and civilized Asia, was not small in England. It was the age of the friars. As in the twelfth century the Cistercians had appeared as a reform on the Benedictines, so now the Franciscans, the Dominicans, and the other mendicant orders, began a far more thorough reform of the monastic system. The Cistercians in their wildernesses might practise an ascetic discipline for the good of their own souls; but they did little for other men. The rest of the nation knew them chiefly as diligent growers of wool. But the friars, carrying the vow of poverty to the extremest point, rejecting corporate as well as personal property, fixed themselves by choice in the most squalid quarters of the towns. They were confessors and preachers; presently they became scholars also, and they had a large share in the increased intellectual activity of the universities. Oxford and Cambridge were now established seats of learning, thronged by crowds of masters and scholars. Up to this time masters and scholars had lived where they could and how they could. In the course of the thirteenth

---

[1] When Walter of Hemingburgh (i. 337) records that Edward I. spoke to the Turkish ambassadors in English, it must not be taken, as it has sometimes been misunderstood, as if it meant that Edward's speaking of English was something exceptional. It would have had this meaning if Edward had been speaking to an Englishman of low degree who was not likely to understand French. But when Edward speaks English to Turks, and has his words interpreted to them by some one who could translate from English into Turkish or Arabic, it shows how familiarly English was spoken by Edward himself and by those about him. So again, in the famous dialogue between Edward and Roger earl of Norfolk, the play on the earl's name *Bigod*, which is found both there and elsewhere, has no force in any language but English.

Colleges in the universities

century colleges began to be founded. That is, by the bounty of some founder, societies of masters and scholars were brought together as corporate bodies, holding a house for their dwelling-place, and lands or other revenues for their maintenance. The first beginnings of this system were seen in Merton College in Oxford and Peterhouse in Cambridge. The growth of these colleges, which in the end came in a manner to swallow up the universities, is the most distinguishing feature of the English universities, as distinguished from those of other lands. But, though the foundation of the colleges and the influence of the friars in the universities were both fruits of the same movement, it must be remembered that they were wholly distinct fruits. The colleges of Oxford and Cambridge were not monastic foundations, except in a few cases where a great monastery established a college in one of the universities for the education of its own younger members. Otherwise the colleges were strictly secular, and religious vows carried with them a forfeiture of membership. The colleges lived on; the intellectual as well as the religious life of the friars was short. They presently fell away from their first love, and became yet more corrupt than the older orders which held a higher temporal position. But, while the first life of the friars lasted, it was brilliant indeed. They were encouraged by Robert Grosseteste; the friar Adam Marsh was the chosen adviser of Earl Simon. The friar Roger Bacon was the wonder of his own day, a master of knowledge beyond his day, and one who paid the penalty of thus outstripping his fellows.

Suppression of the Templars.

The thirteenth century saw the growth of a new kind of monastic order in the form of the friars. The early part of the fourteenth century saw the fall of one of the great military orders which had arisen in the enthusiasm of the crusades. The Templars, the victims of Philip the Fair and his puppet Pope Clement V., were suppressed in England as elsewhere; but it is something that, even in so bad a time as the reign of Edward II., England had no share in the torturings and murderings which marked the suppression of the order in France. The property of the Templars was for the most part granted to the rival military order of St. John, which kept it till the general dissolution of monasteries.

Historians of St. Albans.

The literature of the thirteenth century was abundant in all the three languages which were then in use in England. The statesmen and historians of Henry II.'s day now give way to the monastic annalists. Pre-eminent over other houses is the school of annalists of St. Albans, and pre-eminent among them is the patriotic historian Matthew Paris. He writes of earlier times with little criticism; he cannot be classed on this score with with William of Malmesbury or with William of Newburgh. But he stands at the head of all our annalists as a vigorous, outspoken narrator of contemporary history, not only in England but in the world in general. He is a bold champion of the popular side, a representative of the English Church and nation against pope and king alike. But it should be noted that all the monastic annalists take the popular side, with the single exception of Thomas Wykes of Oseney, the one royalist chronicler of his day. The civil wars called forth a mass of literature in all three languages. The praises of Earl Simon are sung in French and in Latin; and the English tongue now comes forth with a new mission, as the vehicle, sometimes of satire, sometimes of panegyric upon the great ones of the earth. The Englishman's right of grumbling is immemorial, and from the thirteenth century onwards his grumbling has very commonly taken the shape of outspoken rhymes in his own tongue. But, in an historical and political point of view, the most important work of the time of the civil war is the great political poem in Latin rhyme which sets forth the platform of Earl Simon and the patriots. A clearer and more vigorous assertion of popular principles has never been put forth in any age. English had hardly yet reached the dignity of being employed in such a document as this; but the native literature was advancing during the whole of the thirteenth century. Besides devotional works in prose and verse, it was used in long continued poems on various subjects early in the century. The Ormulum of Ormin is religious; the Brut of Laȝamon is legendary. It shows how the tales of Arthur had, even in the minds of Englishmen writing in the English tongue, supplanted the history of their own people. Towards the end of the century our language was put to a better use, in the form of rhyming chronicles, such as those of Robert of Gloucester and the English version of Peter of Langtoft. For a successor to the Peterborough Chronicler, for an English history in English prose, we have still a long time to wait.

Political poems.

English writings.

Architecture of the thirteenth and fourteenth centuries.

In the department of art, the pointed arch, with the details appropriate to that form, was now thoroughly established. In the time of Edward I. the long narrow window of the earlier part of the century began to be exchanged for the large window with tracery, different forms of which lasted as long as mediæval architecture lasted at all. But alongside of development in this way, the sculpture of the early part of the century gradually gave way even early in the fourteenth century, to flatter and less bold forms. In ecclesiastical architecture a new type of church, long, narrow, and simple, quite unlike the picturesque outlines of the older minsters, came in with the friars. Houses began to be larger and more elaborate in plan; but the great change was in military architecture. The massive donjons and shell-keeps of the Norman type grew under the Edwards into castles of vast size and complicated arrangement, planned with great skill according to the military needs of the time. The castle of Caernarvon, begun by the first and continued by the second Edward, shows what is called the Edwardian type of castle in its highest perfection.

Castles.

Warfare.

By this time the art of warfare in England had seemingly changed altogether from what it had been before the Normans came. And yet the change was after all more seeming than real. In the Scottish wars the English array of cavalry and archers, matched against the Scottish spearmen, seemed to show that the English had altogether adopted the tactics of their Norman conquerors. And so, as regards the weapons in use, they had. But an English army still kept its ancient character of having a national infantry as its main strength. It was the preservation of England as a military power that this was the case. We are now coming to the days of chivalry, the days of brutal contempt for all classes of mankind outside the favored pale, the days which, in warfare, went far to put mad personal enterprise in stead of rational military calculation. England was not wholly untouched by these follies; but she was far less deeply touched by them than their native land of France. The difference showed itself when the two nations were matched together in a long and deadly struggle. The French were in the end successful in war, because England had undertaken a task beyond her powers or the powers of any other nation, the task of subduing and holding a country greater than herself. But the English were invariably successful, even with much smaller numbers, in all the great battles. The cause lay in the different constitution of their armies; and the difference in the constitution of their armies lay deep in the difference of the political condition of the two countries. In France political privilege was the exclusive possession of the *noblesse* and the chartered towns. In England freedom was the birthright of all above the villain, and even the villain had many ways of reaching freedom open to him. France therefore had a gallant cavalry in her *noblesse*; for infantry she had either foreign mercenaries or an unwarlike rabble. In an English army the infantry, furnished by the mass of the freemen, formed its main strength, and, more than any other arm, won the great battles. In the course of the fourteenth century, the chivalrous type of warfare received a series of deadly blows dealt by a trained infantry of burghers or yeomen. The Flemings at Courtrai, the men of the Three Lands at Morgarten, the men of the more extended League at Sempach, the Scots at Bannockburn, the English at Crecy, are all instances of the same law. Edward III., pre-eminently the chivalrous king, helped to give chivalry its death-stroke.

Chivalry.

English and French armies.

The French wars.

Of his reign the most prominent feature was the war with France in which that death-stroke was dealt. It is a war which may be looked at from two sides. On the part of the king himself, it was less the warfare of an English king than the warfare of a French prince seeking the French crown.

Character of Edward III.

Causes of the war.

On the part of the English nation it was distinctly a national war. The French influence on England as distinguished from the earlier Norman element in England, the influence which had been going on ever since the beginning of the thirteenth century, reached its height in Edward the son of the Frenchwoman Isabel. The follies of chivalry, follies so conspicuously French as distinguished from either English or Norman, were now in all their glory. We have reached the days of Froissart, chronicler of knights and ladies. We instinctively feel that Edward III. is less of an Englishman than Edward I. But the nation is purely English. If anything was needed to wipe out the last feeble memory of old distinctions, it was the warfare which Englishmen waged in what was now the French province of Normandy. But, in common justice both to Edward and to his people, it must not be forgotten that, though the French war was in form a war waged to win the crown of France for an English king, it was a war which neither king nor people could well have avoided. Edward was goaded into the war by the ceaseless attempts which the French king made on his duchy of Aquitaine, and by the help which the French king gave to the Scottish enemies of England.

Edward's claim to the French crown.

Hereditary succession in France.

The supposed Salic law.

Succession of Philip.

In 1328 the French throne became vacant by the death of Charles IV., the youngest son and last male descendant of Philip the Fair. Edward claimed the crown in right of his mother, the sister of the deceased king. The claim found no support in France, and the crown passed to Philip of Valois, the first cousin of Charles, and the next in succession to the male line. By this decision, just as by the decision of the dispute for the crown of Scotland, a principle was settled, a principle which ever after made the French law of succession different from that of England, Scotland, and Spain. During the 341 years which had passed since the election of Hugh Capet, every king of the French had been succeeded by his own son, and in several cases the succession had been made yet more certain by the coronation of the son in the lifetime of his father. It thus came about that both the notion of hereditary succession as opposed to election, and the notion of direct male succession as opposed to any other rule of succession, had, by this time, taken firmer root in France than in any other kingdom in Europe. The result of a genealogical accident was therefore supposed to spring from an ancient law of the kingdom. As a new jurisprudence had been called up out of the romances of Charlemagne to insure the forfeiture of John, so a new rule of succession was called up out of the ancient Frankish codes to bar the claim of Edward. We now hear for the first time of the imaginary Salic law, which was held to shut out females from the succession to the French crown. According to modern English law, neither Edward nor Philip was the heir; there were females nearer to the crown than either of them. But Edward's doctrine was that, though a female could not herself inherit, yet her son could inherit through her. He claimed as the male person nearest of kin to the late king. Philip claimed in the simpler character of the next in the male line, passing by females altogether. The question was new; but, as the French crown had never passed either to or through a female, the claim of Philip naturally seemed more in accordance with earlier precedent. But, had the argument lain the other way, had female succession been asserted by the Frenchman and male succession by the foreign prince, we may believe that the native candidate would have found his way to the French crown all the same. How little these genealogical subtleties really went for was shown a little later, when, in the dispute for the duchy of Brittany, Edward appeared as the champion of male, and Philip of female succession.

Scottish war of Edward Balliol.

Philip helps the Scots.

Edward takes the title of King of France.

The Hundred Years' War begins.

Peace of Bretigny.

Plate V.

When Edward's claim to the French crown was rejected, he did homage (1329) to his rival for his Gascon duchy, though with some reservations which might keep controversy alive. Matters were hastened by a new Scottish war. The English lords who had held and lost estates in Scotland were, by the treaty of Northampton, to receive them again. This article had not been carried out, and in 1332 the disinherited lords made an attempt on Scotland under Edward Balliol, son of the former king John. Once by their own forces, and a second time by English help, they succeeded in placing their candidate on the Scottish throne. He rewarded his allies by ceding southern Scotland to England, and renewing the old dependent relation for the rest of the kingdom. The state of war between England and Scotland thus began again, and with far less show of reason on the English side than there had been in the days of Edward I. But the Scottish war led to consequences still more important than itself. Philip, ever on the watch for opportunities against Aquitaine, gave help to the Scots (1337), as his predecessor had done in the earlier war. It appears that Edward now for the first time called himself King of France, though the regular use of the title did not begin till three years later. As in former wars with France, Edward formed alliances with the Flemish cities and with the emperor Lewis; and it was to satisfy the scruples of the Flemings, whose land was a French fief, that he finally took the title of King of France.[1] Then followed the first part of the War of a Hundred Years, a struggle of twenty years, broken once or twice by truces. This stage is famous for the naval victory of Sluys in 1340, for the more famous land fights of Crecy in 1346, and Poitiers in 1356, and for the capture of Calais in 1347. The captivity of King John of France at Poitiers led to negotiations, and this first stage of the war ended with the peace of Bretigny in 1360. By its terms Edward renounced all claim to the French crown and gave up his French title. On the other hand, all his possessions on the continent, both his hereditary dominions and his recent conquests, Aquitaine, Ponthieu, and Calais, were released from all homage to the French crown. Calais may be said to have been incorporated with England, and it was afterwards represented in the English parliament, Aquitaine, now become independent of France, as Scotland had become independent of England, was granted by Edward to his famous son Edward the Black Prince, who kept his court at Bourdeaux, now the capital of a sovereign state.

Scottish war; captivity of David Bruce.

The long alliance between France and Scotland against England had now fairly set in, and the Scottish war went on alongside of the French war. In 1346 the king of Scots, David Bruce, invaded England and was taken prisoner, as John of France was ten years later. In the same year as this last event Edward Balliol surrendered his claim to Edward of England, who presently invaded Scotland in the new character of its immediate sovereign. In 1357 David was released, and was described in the treaty as King of Scotland. In later documents however the title was not given either to him or to his successor Robert, the first of the Stuart kings. A desultory and occasional warfare long went on, and the claims of the English kings, either to the old superiority or, by the cession of Edward Balliol, to the Scottish crown itself, are ever and anon put forward. England had now, in the form of Scotland and France, a standing enemy on each side.

Second French war.

The peace of Bretigny was not long kept. The English rule in Aquitaine was, speaking generally, acceptable to the cities; but the French connection was more to the taste of the nobles. The prince of Aquitaine presently embroiled himself in the affairs of Spain, supporting Pedro the Cruel of Castile against his brother Henry. In 1367 he won the splendid but useless victory of Navarete or Najara; but the cost of the expedition led to injudicious taxation in Aquitaine. Though the principality no longer owed homage to the French crown, those who deemed themselves aggrieved appealed to the French king as superior lord. Charles V., who had succeeded John in 1364, accepted the appeal, and summoned the prince of Aquitaine to his court. A new war began, which, often carried on with much languor, often interrupted by truces, but not ended by any formal peace, lasted till the treaty of Troyes in 1420. The peace was clearly broken by the French, and Edward again took up the title of King of France. But fortune now dis-

---

[1] The usual Latin title of the French kings had always been national and not territorial: "Rex Francorum," not "Rex Franciæ." But, as the territorial style was now fully established in England, Edward called himself "Rex Franciæ et Angliæ." The territorial style was finally adopted by the French kings when the French crown passed to a king of Navarre. The style then became "Rex Franciæ et Navarræ," till the ancient title was revived in 1791.

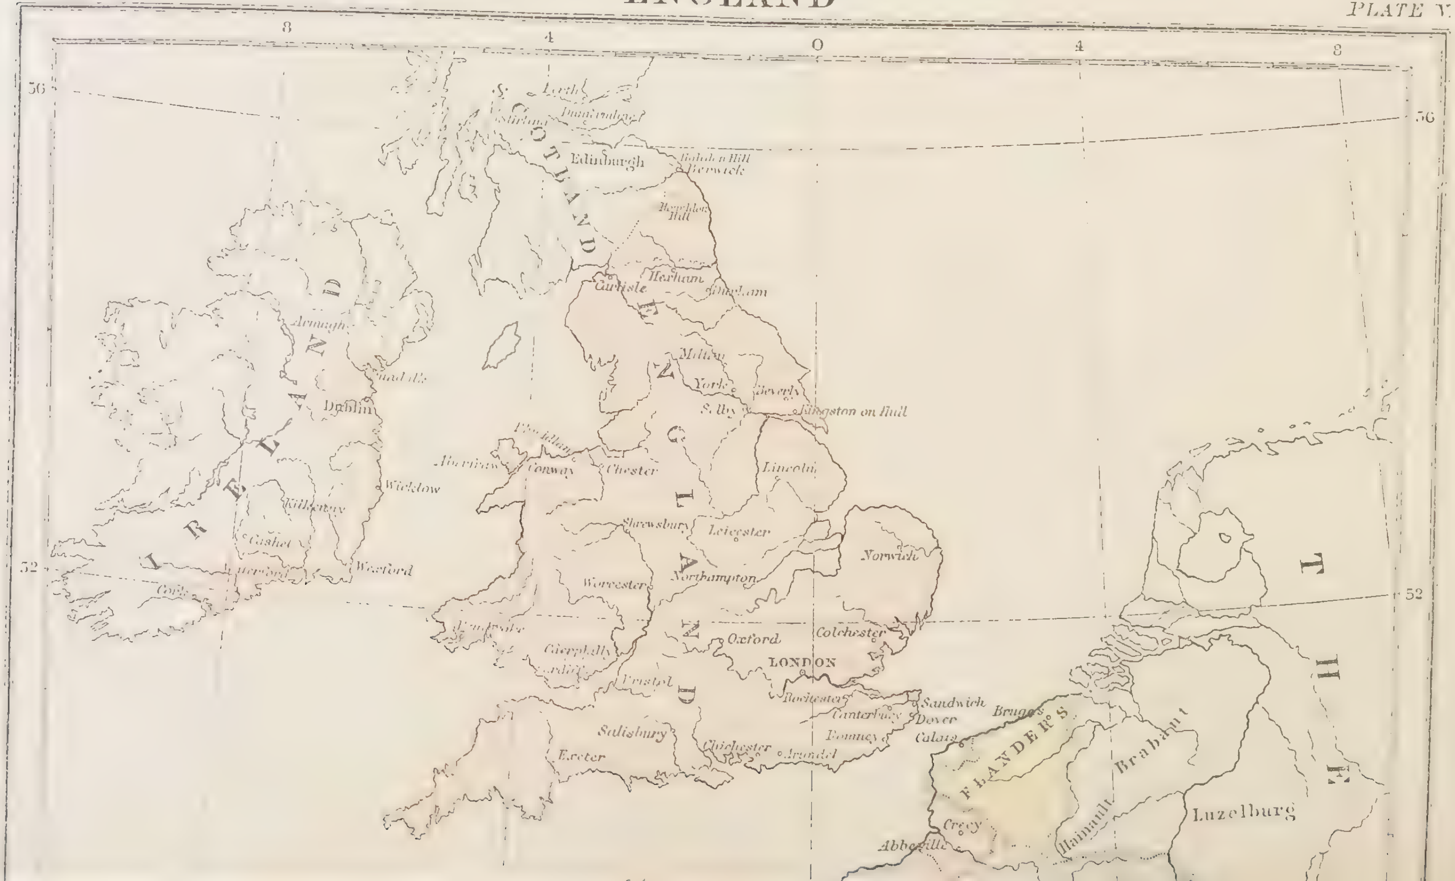
ENGLAND

PLATE V.



tinctly turned to the French side. The most striking event of the war was the recovery and massacre of Limoges by the prince of Aquitaine in 1370. The prince now came to England to end his days more worthily as a patriotic statesman. The war went on, till in 1374 all was lost save Calais, the great southern cities of Bourdeaux and Bayonne, and a few other points in the south. The last few years of Edward's reign were a time of truce.

Reign of Richard II.

The change from the reign of Edward III. to that of Richard II. is in some points like the change from the reign of Edward I. to that of Edward II. The leading events again touch the internal rather than the external history. The internal history of the reign of Edward III. is of the highest importance. But it is of an importance wholly constitutional and social. It is not marked on the surface by any striking internal events. In the reign of Richard we have over again the same kind of internal events which mark the reign of Edward II., but with the addition of a great social struggle to which we have seen no parallel in earlier times. But, if there is much in common in the two reigns, there is a marked difference between the two men. Richard, if foolish and extravagant, was not weak; he had distinct political aims; he seems to have seriously designed the establishment of a despotic power in the crown. His accession marks another stage in the growth of the doctrine of hereditary succession. Richard, the minor son of the Black Prince, succeeded his grandfather without opposition, without any public mention of any claims on the part of his uncles, the surviving sons of the late king. In fact the dissatisfaction which was shown at a vague rumor that the young king's eldest uncle, John of Gaunt, duke of Lancaster, had designs on the crown, shows how men's ideas on such matters had changed, not only since the days of Ælfred, but even since the days of John. In the reign which thus began foreign affairs become quite secondary. The wars both with France and Scotland go on, but they go on for the most part languidly; occasional raids alternate with truces. But the very beginning of Richard's reign saw an actual French invasion of England, in which the Isle of Wight was ravaged and Hastings burned. The French war was ended, as far as this reign is concerned, by Richard's second marriage with Isabel of France in 1396, which was accompanied by a truce for twenty-five years.

Succession of grandsons.

The peasant revolt.

The first marked internal event of Richard's reign was the result of political, social, and religious causes which had been busily at work during the reign of Edward. The immediate occasion of the famous outbreak of Richard's time was a poll-tax which was laid on by parliament in 1380. The peasant revolt of the next year followed. The spirit shown by the young king in the famous story of the death of Wat Tyler has often been dwelled on, as if it were something exceptional. But Richard did not like spirit at any time; and at this time his spirit was chiefly shown in making promises which were not, and could not be, carried out. The revolt was put down, and the rest of the internal history of the reign consists of disputes, not so much between the king and the people or the barons in general as among his uncles, his favorites, and his ministers. One of Richard's favorites, Michael de la Pole, earl of Suffolk, deserves notice, less on his own account than as one who, sprung from a merchant family at Kingston-on-Hull, rose to the height of power. Though he himself fell from power and died in obscurity, yet he was in the end the founder of a ducal house. We thus see that the contempt for trade which had lately come in among the other follies of chivalry was, after all, not very deep set. Richard's other chief favorite was Robert Vere, of the house of the earls of Oxford, whom he raised to the rank of marquess of Dublin, and at last to that of duke of Ireland. The year 1386 saw the fall of the favorites; and the impeachment of the earl of Suffolk by the Commons marks a constitutional stage. This time the accused escaped with a slight punishment; but, as in the times of Henry III. and Edward II., the royal authority was transferred to a council under the duke of Gloucester. The next year the king attempted a revolution; but a new impeachment followed, on which both the favorites were condemned to death as traitors in a parliament known as the Wonderful and the Merciless; but they escaped beyond sea. In 1389 the king, by a sudden stroke, won back his power. For a while his rule was constitutional and seemingly not unpopular; but he gradually aimed at despotism. In 1397 he procured the overthrow of his uncle the duke of Gloucester and the chief of the nobles of his party, contriving that all that was done openly should be under legal forms. Duke Thomas died in a mysterious way. His chief adherent, the earl of Arundel, was beheaded. In the next year, on occasion of a judicial combat between Thomas Mowbray, duke of Norfolk, and the king's cousin Henry, duke of Hereford, the son of John of Gaunt, the king arbitrarily banished both disputants, but promised them the possession of their estates. But in breach of this promise, when John of Gaunt died in 1399, Richard seized on the inheritance of his son. He then chose this very inopportune moment to go personally to settle the disturbances of Ireland. During his absence Henry came back; Richard, on his return, found himself generally forsaken, and he was presently deposed by parliament. The election of Henry in his place was perfectly regular according to ancient precedent. But two things again mark the growth of the new ideas. Not only, as in the case of Edward II., was the deposed king made to resign, but Henry himself, in claiming the crown, did not rely solely on his perfectly good parliamentary title, but mixed up with it a vague claim by hereditary right. He was "descended by right line of blood coming from the good lord King Henry III." This phrase makes it needful to explain a little more fully the state of the royal succession, which becomes of such importance in the next period.

Revolutions of Richard's reign.

Impeachment by the Commons.

Richard's deposition.

Claim of Henry IV.

Growth of the hereditary doctrine.

Richard himself had, as we have seen, succeeded without opposition, according to the doctrine of representation, though in earlier times the choice of parliament would have rather fallen on one of his uncles. The new ideas were carried yet further when, under Richard, Roger Mortimer, earl of March, was declared presumptive heir to the throne. The doctrines both of representation and of female succession were here implied, as Roger was through his mother grandson of Lionel, duke of Clarence, second son[1] of Edward III. In earlier times, whatever might have been thought of Richard's own claim, such a claim as this of Roger would have seemed ridiculous while three sons of Edward, the dukes John of Lancaster, Edmund of York, and Thomas of Gloucester, were all living. And in fact the claim of Roger was not put forward at the deposition of Richard and election of Henry; but it was not forgotten, and later events again gave it importance. Henry's own challenge by descent from Henry III. was shrouded in purposed vagueness. He is commonly thought to have referred to a claim of his own yet more strange than the claim of Earl Roger. He was, through his mother, the direct representative of Edmund, earl of Lancaster, the second son of Henry III., who, according to an absurd rumor, was really his eldest son. Such a claim could hardly be put forward publicly; and Henry's vague words might be taken as meaning only that he was the next to the crown in male succession. But that any claim of the kind should have been thought of, when Henry had a perfectly good right by parliamentary election, shows how the ancient right of the nation freely to choose its sovereign, at all events from among the members of the royal house, was gradually dying out of men's minds.

Reign of Henry IV.

The short and troubled reign of Henry IV. has commonly led to forgetfulness of his earlier fame as a gallant and popular prince, a pilgrim to Jerusalem, a crusader in Africa and Prussia. The fourteen years of his reign are almost wholly filled with plots, civil wars, and the endless warfare in Scotland and France. Now again Wales becomes of importance, through the union of a Welsh pretender with the discontented party in England. In the early insurrections, as in that of 1400, the name of the late king Richard was used. The fate of the deposed king was never certainly known; but there seems no just ground for doubting that he either died or was murdered soon after this first revolt. That a pretended Richard appeared, that he was made use of by Henry's French and Scottish enemies, was simply what commonly happens in such cases. The revolt of 1400 was hardly suppressed when it was followed by the more dangerous revolt of Owen Glyndwr, who restored for a while the old independence of North Wales, and acted in concert with the French, the Scots, and the English rebels. In fact, down to his death in 1415, he was never fully subdued. His English allies, the Percies and Mortimers, were defeated at Shrewsbury in 1403; and other plots and revolts, in all of which the house of Percy had a hand, were crushed in 1405 and 1408. At the time of Henry's death, in 1413, there was a truce with Scotland; but the war in France, which had gone on during the whole of his reign, was being waged with a greater vigor than usual.

---

[1] Lionel was strictly the third son of Edward III.; but he was the second of those who left descendants. As all the three elder sons of Edward died before their father, John of Gaunt was the eldest surviving son of Edward at his father's death.

State of France.

In 1406 the crown was settled by parliament on Henry and his sons; and on his death his eldest son Henry succeeded without opposition. A new æra in the French war at once began. France, under its weak or rather mad king Charles VI., was torn in pieces by the factions of Orleans and Burgundy. Henry IV. had, in the latter years of his reign, employed the policy of playing off one party against the other, and had given help to each in turn. The war, which had gone on, though mostly in a desultory way, ever since the return of the Black Prince to England in 1370, now began again in earnest under a king who was one of the greatest of warriors and statesmen. The character of Henry's enterprise is often misunderstood. It is said that, whatever claim Edward III. might have had to the crown of France, Henry V. could have none. It is said that, according to Edward III.'s doctrine, by which the right to the crown might pass through females to their male representatives, the rights of Edward III. had passed to Roger of March. So, as a matter of genealogy, they certainly had; and, as a matter of genealogy, there was doubtless an inconsistency in the use of the French title by Henry IV. and Henry V. But the true way of looking at the matter is that both the peace of Bretigny and the truce made in the latter years of Richard II. had been broken by the French, that the war was going on at Henry's accession, that it was just then being more vigorously pressed than it had been for some time, and that all that Henry V. did was to throw the whole national power, guided by his own genius, into its vigorous prosecution.

The war pressed by Henry V.

At his accession, his only continental possessions were Calais and its small territory, and a small part of Aquitaine, including Bourdeaux and Bayonne.

Character of his policy.

In Henry's policy, Southern Gaul, which had been so nearly lost, becomes secondary. He puts forward the treaty of Bretigny, as he also puts forward his claim to the French crown; but his real object seems to have been the conquest of as large a continental territory as possible, but in any case the conquest of Normandy. At this distance of time, we see that such a scheme was neither just nor politic. His own age did not condemn it on either ground. He was checked for a moment, first by a Lollard revolt, then by a conspiracy on behalf either of Richard or of the earl of March. But in 1415 he was able to begin his great enterprise. A negotiation, in which Henry claimed, first the crown of France, then the whole continental possessions of the Angevin kings, and lastly the territory ceded at Bretigny, naturally failed. He then crossed the sea in 1415, took Harfleur, and won the battle of Agincourt.

His conquests.

The three next years saw his alliance with Duke John of Burgundy, and completed the conquest of Normandy. In 1419 the murder of Duke John by the partisans of the dauphin Charles drove Philip, the new duke of Burgundy, and the whole Burgundian party altogether to the English side. Paris itself received Henry.

Treaty of Troyes.

Next year (1420), by the treaty of Troyes, Henry gave up his title of King of France. Charles VI. was to keep the French crown for life; Henry was to marry his daughter Katharine, to be declared his heir, and to be meanwhile regent of the kingdom. But the party of the disinherited dauphin still held out, and the war went on in the centre of France, while the rule of Henry was established in the north and south. On August 31, 1422, Henry V. died, revealing the true object of his policy by his last injunction that in no case should peace be made, unless Normandy was ceded to England in full sovereignty.

Henry VI. succeeds to both kingdoms.

The infant son of Henry and Katharine, Henry VI., succeeded to the kingdom of England and the heirship of France. Two months later, by the death of his grandfather the French king, he succeeded, according to the provisions of the treaty, to the crown of France. His two kingdoms were intrusted to the regency of his two paternal uncles, England to Humfrey duke of Gloucester, and France to John, the great duke of Bedford. The babe was king at Rouen and Paris, and either king or sovereign lord at Bourdeaux;[1] but in the intermediate land he had a rival in a third uncle, his mother's brother, Charles VII.

Reign of Henry VI.

A time of thirty years follows, in which the English were gradually driven out of France and Aquitaine, till nothing was left of the old heritage except the Norman islands, and nothing was left of the new conquests except Calais and its small territory. Even after Henry was dead, the great regent was far stronger than the French claimant; but several causes, one after the other, joined to break the English power on the continent. The mainstay of England was the Burgundian alliance. This was first put in jeopardy by the marriage of Duke Humfrey, the regent of England, with Jacqueline, countess of Holland and Hainault, and his attempt to get possession of her dominions. Then, in 1429, came the wonderful career of the Maid, Joan of Arc. She raised the siege of Orleans; she led Charles to be crowned at Rheims, a ceremony which gave him a certain advantage over his uncrowned rival. Her intervention turned the tide for a while on the French side; but Charles seemed quite unable to press his advantage, and he did absolutely nothing for the deliverance of the Maid when in 1430 she was taken prisoner, and was the next year burned as a heretic and sorceress. Meanwhile Henry was crowned in England in 1429 and in Paris in 1431. In the next year the death of the duchess of Bedford, sister of the duke of Burgundy, broke the tie between her husband and her brother. At last, in 1435, at the peace of Arras, Philip altogether forsook the English alliance. Almost at the same moment the duke of Bedford died, and from this time the English power in France gradually fell back.

Losses in France.

Paris was lost in 1436. Presently comes a time of truces and negotiations; and in 1445, on the king's marriage with Margaret of Anjou, Maine and Anjou were surrendered. In 1449 Rouen was lost, and the second French conquest of Normandy was completed in the next year. In 1451 the French conquered all that was left to England in the south, Bourdeaux being the last town to hold out. But here the tide once more changed for a moment. The Aquitanian cities found that they had gained nothing by their transfer to the nearer instead of the more distant master. In 1453 John Talbot, the great earl of Shrewsbury, came with an English force, and was welcomed as a deliverer. He was slain at Castillon in July; Bourdeaux was again taken by the French in October, and the tie of three hundred years which united England and Aquitaine was broken for ever.

Final loss of Aquitaine.

Less striking in the history of the world, the French conquest of Aquitaine is, in the history of Western Europe, almost as marked an epoch as the Turkish conquest of Constantinople which happened nearly at the same moment. Two great questions were decided by it. The Norman Conquest first made England a continental power; the succession of the Angevins greatly increased her continental position. That position now wholly passed away. England is now again shut up within her own four seas.

New relations between England and France.

From this time she constantly takes a part in continental affairs; but she holds no continental possessions save such outlying posts as Calais, Boulogne, Dunkirk, or Gibraltar. Calais she kept for another century, partly no doubt because the cessions made by France to Burgundy at Arras cut off Calais from the French territory, and made Burgundy the one continental neighbor of England.

French conquest of Aquitaine.

Again, the French conquest of Aquitaine is no less an epoch in the history of France itself. It completed the formation of France in the modern sense. Ever since the twelfth century, the French kings had been striving after dominion south of the Loire, that is, after the union of Southern with Northern Gaul. They gained their point for a moment by the marriage of Lewis and Eleanor. They gained it again for a moment by the surrender of Aquitaine to Philip the Fair. They now gained it for ever. The whole relations between

---

[1] After the peace of Bretigny, Edward III. changed his style of *Duke* of Aquitaine to *Lord*. He was "Dominus Hiberniæ et Aquitaniæ." When he again took up the title of King of France, it might have been doubted whether Aquitaine remained a distinct sovereign lordship or was merged in the kingdom.

England and France were now changed. There were to be many later wars between the two kingdoms, and for a while the old claims of England were always remembered and were now and then asserted. But any serious hope of an English conquest of France, or even of an English conquest of Normandy or Aquitaine, passed away when Bourdeaux opened its gates to the French in 1453. From that day the modern relations between England and France begin.

Internal growth of England.

The period of the Hundred Years' War was the time in which what we may call the growth of England came to an end. The nation in its later shape was fully formed at the end of the thirteenth century. The great lines of its later law and constitution have been already drawn. During the following period law and constitution have to take their perfect shape at home, and the nation, now fully formed, has to take its final position among the powers of Europe. During this time England and the English people became essentially all that they have been ever since. The changes in later times have been great and important; but they have been changes of detail. In the thirteenth century it was still by no means clear what was to be the final shape of English institutions, what was to be the final position of the English people at home and abroad. In the fifteenth century all this had been fixed. The constitution, the laws, the language, the national character, of Englishmen had all taken a shape from which in their main points they were never again to change. The island realm, with the character of islanders impressed upon its people, with its political constitution and its social state differing from that of any other European nation, was by the end of this period fully formed. When we have reached the end of this period, we know what England is. The personal character of the nation is now fixed. Up to this time the history of the nation has been the record of its growth; our study has had somewhat of a physical character. From this time our study is rather biographical; our history ceases to be the record of the growth of a nation; it becomes the record of the acts of a nation after it has taken its final shape.

Constitutional aspect of Edward III.'s reign.

Relations of Lords and Commons.

Petitioning power of the Commons.

Judicial powers of parliament.

In a specially constitutional aspect, the reign of Edward III., the central time of the period with which we are dealing, is hardly less important than the reign of Edward I. But its importance is of a different kind. The earlier reign fixed the constitution of parliament; it decreed that in an English parliament certain elements should always be present. It laid down as a matter of broad principle what the essential powers of parliament were. In the later reign, the essential elements of parliament finally arrange themselves in their several places and relations to one another. The powers, rights, and privileges of each element in the state, and the exact manner of exercising them, were now fixed and defined. The Commons are now fully established as an essential element in parliament. It is further established that prelates, earls, and barons are to form one body, that knights, citizens, and burgesses are to form another. That is to say, as the attempt to make the clergy act as a parliamentary estate came to nothing, parliament now definitely took its modern form of an assembly of two houses, Lords and Commons. A statute of Edward II. in 1322 distinctly asserted the right of the Commons to a share in all acts which touched the general welfare of the kingdom. But a distinction was for a long time drawn between the older and the newer element in the assembly. For a long time the doctrine was that the Commons petitioned, and that their petitions were granted by the king with the assent of the Lords. This position of the Commons as a petitioning body is of the deepest importance, and looks both forwards and backwards. Looking backwards, it was an almost necessary result of the way in which parliament had grown up. The Lords were, and the Commons were not, representatives by direct succession of the ancient sovereign assemblies of the land. It was for them by immemorial right to advise the king and to consent to his acts. The Commons had been called into being alongside of them; they had no such traditional powers; they could win them only step by step. Looking forwards, the position of the Commons as a petitioning body was a source of immediate weakness and of final strength. For a while they simply petitioned; not only might their petitions be refused, but, if they were granted, they had no control over the shape in which they were granted. If the king granted a petition which involved any change in the law, it was by royal officers that the petition was put into the form of a statute after the representatives of the Commons had gone back to their homes. Such a practice gave opportunity for many tricks. It was a frequent subject of complaint that the petitions which were said to be granted, and the statutes which were enacted in answer to them, were something quite different from what the Commons had really asked for. This evil was first seriously checked in the reign of Henry VI., when the practice was established which still prevails, that of bringing in, instead of a mere petition, a bill drawn in the form which the proposed statute was intended to take. Again, as long as the Commons were mere petitioners at whose request a law was enacted, it might be held that the king was equally able to enact at the request of some other petitioning body. Thus we still find statutes sometimes enacted, without the petition of the Commons, sometimes, for instance, at the petition of the clergy. So again, this same position of the Commons as a petitioning body led to one distinction between them and the Lords which has gone on to our own times. In one chief function of the ancient assemblies the Commons never obtained a direct share. Parliament, like those ancient assemblies, has always been the highest court of justice. But its strictly judicial powers have always been exercised by the Lords only. The Commons, by virtue of their petitioning power, have become denouncers and accusers; but they have never become judges. By virtue of their petitioning power, they began, as early as the reign of Edward III., to denounce the ministers of the king, and to demand their dismissal. In the Good Parliament of 1376, and again in the parliament of Richard ten years later, this power grows into a regular impeachment of the offenders, which is brought by the Commons as accusers before the Lords as judges. Whenever the Commons have taken part in action which was practically judicial, it has always been under some other form. They have exercised a somewhat arbitrary and anomalous authority in defence of their own privileges. They have passed bills of attainder and bills of pains and penalties; but these take the form of legislative acts. Strictly judicial functions like those of the Lords they have never claimed.

Position of the Lords.

Nature of the peerage.

New ranks of peerage.

One effect of the growth of the Commons was to give a more definite position to the Lords. As long as there was only one body, and that a fluctuating body, membership of the assembly could not be looked on as conferring any definite *status*. None but the bishops and earls had any undoubted personal claim. Some abbots, some barons, were always summoned; but for a long time they were not always the same abbots or the same barons, and the memory of the old right of attendance on the part of the whole free population had not altogether died away. So long as this state of things lasted, no definite line could be drawn between those who were members of the assembly and those who were not. It was only when a new body arose by the side of the old one, a body which confessedly represented all persons who had no place in the elder body, that membership of the elder body bebecame a definite personal privilege. The vague and fluctuating gathering of the great men of the realm now grew into a peerage of known members and possessing defined rights. The very change which made the Lords, as we may now call them, sharers in their powers, in every way raised the position of the Lords as a class. The peerage, with its several ranks and its defined privileges, grew up in the reigns from Edward III. to Henry VI. It was gradually established that the king's writ of summons, by which he called this or that man to give his attendance in parliament, conveyed a perpetual right, not only to himself but to his heirs. And now that the peerage has taken this more definite character, we hear of new and more solemn ways of admission to its ranks, such as creations in parliament and by letters patent. New titles of peerage of foreign origin were devised. Edward III. first created dukes, beginning with his own sons. The duchy of Cornwall has ever since belonged of right to the eldest son of the sovereign. Under Richard dukes became more common; under him too the title of *marchio* or marquess, properly the lord or guardian of a *march* or frontier, came to denote another honorary rank of peerage. Under Henry VI. another new rank of peerage first appears, that of *vicecomes* or viscount, a word which had hitherto meant the sheriff of a county. All these new titles were, as titles, purely honorary; they expressed mere rank, with no rights or duties but such as were common to the whole peerage. The creation of these new titles completed the change in the position of the earls, about whom some trace of their original official character long hung. The earldom now became a mere rank in the peerage, like any other. The new dukes and marquesses were set above the earls, while the viscounts were thrust in between the earls and the barons. But both the old titles and the new kept the same position as ranks in an official peerage, in a body of legislators and judges, the temporal portion of which held their seats by genealogical succession.[1] But no nobility in the foreign sense was, or could be, created. Because the peer was raised above other men as hereditary legislator and hereditary judge, therefore his children remained, like other men, members of the general body of the Commons.

Children of peers commoners.

The king's prerogative defined and strengthened.

As the growth of the Commons at once raised and defined the position of the Lords, so the general growth of the power of parliament at once defined, and by defining strengthened, the king's prerogative. It now became a question what acts were lawful to the king without the consent of parliament, and what acts needed that consent. It is clear that, whenever prerogative was defined, it was at once limited and strengthened. But the very strengthening was of the nature of a limitation. A power which was directly or indirectly bestowed by parliament ceased to be a power inherent in the crown. The struggle was therefore a hard one. The kings strove to hold their ground at every point, and to escape from the fetters which the nation strove to lay upon them. When the Commons tried to make the king dismiss evil counsellors or moderate the expenses of his household, when they tried to regulate the oppressive right of purveyance, the king was apt to find a loop-hole in some protest or reservation or saving clause. So the kings strove to keep the power of arbitrary taxation in their own hands by drawing distinctions between customs and other sources of revenue. So they strove to keep the power of legislation without the consent of parliament, by drawing a distinction between statutes and ordinances, and by pretending to a right to suspend the operation of statutes. The claim to legislate by ordinance is closely connected with the way in which all our legislative and judicial bodies arose. The parliament, the privy council, the courts of justice, have all grown out of the ancient assembly. For some while after the Conquest it is not always easy to see whether the words *curia regis* mean the great council of the nation or the smaller council of the king's immediate advisers. The greater and the smaller council were alike fragments of the national assembly, and both alike derived their special shape from the practice of personal summons. If one body so formed had the right of legislation, it might be argued that the other body so formed had it also. So again, as the Commons grew, the form of their petitions, praying that such and such an enactment might be made by the king with the consent of the Lords, seemed to recognize the king as the only real lawgiver. It might suggest the thought that he could, if he would, exercise his legislative powers, even though the Commons did not petition, and though the Lords did not assent. A crowd of loop-holes were thus opened for irregular doings of all kinds—for attempts on the part of the kings to evade every constitutional fetter—for attempts to reign without parliaments, to impose taxes by their own authority, or to legislate with the consent only of their own council or of some other body other than a regular parliament. Every point had to be struggled for over and over again. But by the end of the fourteenth century we may say that the constitution and the powers of parliament were, as far as the letter of the law went, much the same as they are now. But it took three hundred years more to secure the observance of the letter of the law, while the two hundred years that have followed have, by the side of the written law, developed the unwritten constitution.

Unconstitutional practices of the kings.

Actions of parliament as to peace and war.

For the peculiar character of that unwritten constitution, for the system by which a crowd of powers which the Commons shrink from directly exercising are now exercised by them indirectly, we have to wait for some ages. In those days a power was either exercised directly or it was not exercised at all. Thus one most important power which was freely exercised by our most ancient assemblies, but which modern parliaments shrink from directly exercising, the power of making peace and war, was in the fourteenth century in a very irregular state. Sometimes parliament claims a voice in such matters; sometimes the king seems to thrust a control over them on an unwilling parliament. That is to say, the kings wished to make parliament share the responsibility of their acts. A parliament could hardly refuse to support the king in a war which it had itself approved. The wars of Edward III., and his constant calls for money, made frequent parliaments needful. Perhaps no other series of events in our history did so much to strengthen and define every parliamentary power. But it was mainly by the petitioning position of the Commons that all power has thus been drawn into the hands of parliament. Any matter might become the subject of a petition of the Commons. It followed that, as their petitions gradually grew into demands which could not be resisted, every matter might become the subject of legislation by the Commons. In their position as petitioners lay their strength. They only petitioned, while the king enacted and the Lords assented. But the humbler position gave them the first word. The enacting power of the king gradually came to be a mere power of refusing to enact, a power which has long ceased to be exercised. The humble petitioners came to be the proposers of everything, and so to be the masters of everything. They had the privilege of the *prærogativa tribus*.

Growth of the power of the Commons.

Power of parliament to settle the succession.

The power of parliament to settle the succession to the crown, that is, the ancient right of election in another shape, comes more largely into play at a later period. We have however one of the greatest instances of its exercise in the deposition of Richard and the settlement of the crown on Henry IV. and his heirs. And twelve years before the ancient doctrine was carried out in practice, it was solemnly declared by Bishop Arundel and Thomas duke of Gloucester, speaking in the name of parliament, that, by an ancient statute, parliament, with the common consent of the nation, had a right to depose a king who failed to govern according to the laws and by the advice of his peers, and to call to the throne some other member of the royal family in his stead. Most certainly there never was such a statute in the form of a statute; but the doctrine simply expressed the immemorial principle on which the nation had always acted whenever it was needful. And the statement that there was a statute to that effect was perhaps simply an instance of the growth of the doctrines of the professional lawyers. Men were beginning to forget that the earliest written law was nothing more than immemorial custom committed to writing. They were beginning to think that, wherever there was law or even custom, it must have had its beginning in some written, even if forgotten, enactment.

Attempts to influence elections.

After all, nothing better shows the power of parliament than the attempts which were often made by those in power to procure a packed House of Commons. Complaints were made that the sheriffs returned knights of the shire who were not really the choice of the electors, and that they summoned, or failed to summon, boroughs to send burgesses, according to their arbitrary will. Lastly, in the early days of Henry VI., we find the rights of the electors restricted by parliament itself. The constitution of the House of Commons was clearly growing too popular for the ruling powers, and it was thought needful to legislate in the interests of oligarchy. By the statute of 1429 the electors of "small substance and of no value" were disfranchised, and the right of voting was confined to those who had a freehold of

---

[1] "Genealogical succession," because the phrase "hereditary succession" is, in the older use of the word, applicable alike to the spiritual and the temporal peers, at least as both classes stood till the union with Scotland. In older language "jus hereditarium" means a right handed on from one holder to another, whether the successor be the son of the last holder, or a person chosen or appointed to succeed him after his death. In this sense, the seats attached to the sees of Canterbury, York, London, Durham, and Winchester are still as strictly hereditary as any earldom or barony. But that name cannot apply to various modern forms of peerage, such as the elective peers of Scotland and Ireland, to the rotatory bishops of Ireland now abolished, to those bishops of England who succeed only by seniority, or to the last newly created judicial peerages.

Narrowing of the franchise.

forty shillings yearly, a not inconsiderable amount at that time. By another statute of the same reign (1444–45) it is enacted that the knights chosen shall be "notable knights or notable esquires, gentlemen by birth." This enactment is instructive in many ways. It shows, what we find to have been the case almost from the beginning, that the knights of the shire were not always knights in the strict sense. The electors were clearly trying to break down all distinctions of rank and birth, and an attempt is made to enforce these distinctions by law. Happily no definition of "gentlemen by birth" was or could be attempted. This backsliding statute has therefore become a dead letter, as its fellow has no less through the change in the value of money.

The Good Parliament.

The powers of parliament in this age, and the external influences under which parliaments acted, cannot be better illustrated than by a comparison of the last two parliaments of Edward III. The parliament of 1376, which lived in men's memories by the name of the Good Parliament, had the full support of the prince of Wales. It was able to overthrow the king's ministers, to remove his favorite Alice Perrers from court, and to encumber him with a council. A crowd of petitions of various kinds were presented, some of them insisting on freedom of election. The houses separated; the prince died; all the acts of the parliament were set at naught; most of them were reversed by a packed parliament the next year. Yet even this packed parliament established some wholesome doctrines, and amongst others enacted that no statute should be made at the petition of the clergy without the consent of the Commons. The same alternation of reforming and reactionary parliaments is found under Richard II. There is no surer witness to the importance of any assembly or other institution than the fact that the ruling powers find it convenient to corrupt or pervert it.

John Wickliffe.

When we turn to the religious, the social, and the literary aspect of this period, we may be amazed at the way in which the three are all intertwined together, and in which they all gather round a single man. We cannot write the history of the fourteenth century in any of these aspects, we cannot write the history of the fifteenth as affected by causes which had their beginning in the fourteenth, without bringing in the name of John Wickliffe. As a man who was employed in important negotiations with foreign powers, he has earned his place in any minute record even of the outward political history of his time. But it is in these other three branches that he stands out as the foremost figure of his time. But, while he is prominent in all three alike, it is his religious position which is primary. His influence on our social and literary history is secondary, and acts wholly through his religious position. Wickliffe, a renowned schoolman and doctor of Oxford, a well-beneficed secular priest, and not unknown in the political world, made himself the centre and the mouth-piece of the great need of his time. The fourteenth century saw the beginning of a cry for a religious reformation in a wider sense than a mere reform of the abuses of the moment. Reforms of that kind have been demanded, promised, and indeed partly attempted, in almost every age. The day of the monks was past when the day of the friars began; and now the day of the friars was past also. They too had fallen from their first love, and the abuses of the mendicant orders formed one of the chief subjects of declamation for the reformers of the time. The bounty of founders now took another form. The foundation of colleges in the universities went on briskly all through the fourteenth and fifteenth centuries. Schools and hospitals, chantries and colleges of priests attached to parish churches, were largely founded; but the foundation of monasteries was now rare. The great foundations of William of Wykeham at Winchester and Oxford, followed by those of Henry VI. at Eton and Cambridge, form an æra in the history of education in England.

Foundation of colleges.

Resistance to the popes.

It is singular that this new class of foundations was largely helped by an act of legislation which might well pass for spoliation of the Church. The fourteenth century and the beginning of the fifteenth was a busy time of legislation on ecclesiastical matters. The political strife with the Roman see went on in full vigor, with all the more vigor because the Roman see had in some sort ceased to be a Roman see. In the fourteenth century the popes were no longer the common fathers of Christendom, ruling from the centre of Christendom. They had forsaken Rome for Avignon, a city close to the French border, and where they were the tools of the king of the neighboring realm. The popes of Rome had been oppressors and spoilers of England; the popes of Avignon were her political enemies, the allies of her rivals in Britain and on the continent. When, later in the century, Rome and Avignon became the seats of rival popes, England was naturally found on the side of pope of Rome, France and Scotland on the side of the pope of Avignon. But, whether at Rome or at Avignon, the foreign ecclesiastical power had to be kept in check. A series of statutes designed to check papal encroachments marks the reign of Edward III., and still more conspicuously marks the reign of Richard II. The statute of provisors checked the interference of the popes with the disposal of English benefices. The statute of *præmunire* denounced the heaviest penalties against the unauthorized introduction of papal bulls into the kingdom. Legislation of this kind was indeed only repressing innovations; it was bringing the law back to what it had been in the days of King Eadward and King William. Under the house of Lancaster, the spirit of opposition to the papal claims grew fainter, at all events on the part of the kings. In the appointment of bishoprics especially, pope and king found it easy to play into one another's hands, at the expense of the ecclesiastical electors. Meanwhile, from the reign of Edward III. onwards, opposition to the aggressions of the head of the Church abroad grew into a dangerous hankering after the possessions of the Church at home. In the later days of Edward a strong party of the baronage, headed by John of Gaunt, were zealous for ecclesiastical reform, in the sense of confiscation of ecclesiastical property and of the exclusion of churchmen from political office. In the reign of Henry IV. a scheme was proposed in the Commons for the general confiscation of ecclesiastical revenues. This storm was turned aside, but the hand of disendowment fell heavily in the next reign on one class of ecclesiastical foundations, though, as it turned out, greatly to the profit of another class. The new colleges and other foundations were largely endowed out of the revenues of the alien priories. These were monasteries in England which were dependent on greater monasteries in Normandy or elsewhere beyond the sea. During the wars with France these alien houses were looked on as outposts of the enemy, and in the reign of Henry V. they were finally suppressed. By far the greater part of their revenues went to the educational and secular foundations which were growing up at Oxford, Cambridge, and elsewhere. A king and a primate, both of them of a piety unusual in that age, Henry V. and Archbishop Chicheley, were the chief actors in this alienation of ecclesiastical revenues by the secular power.

Designs against church property.

Suppression of alien priories.

Beginning of religious dissent.

Teaching of Wickliffe.

But changes of this kind were not religious reformation; they were hardly ecclesiastical reform. It is plain that the corruptions of the Church were growing; everything shows the prevalence of a hard, secular, grasping spirit in ecclesiastical relations. The primates of the fourteenth and fifteenth centuries are, if we except the momentary primacy of Thomas Bradwardine, an inferior race to those of the thirteenth. Men cried, as they had ever cried, for the reform of practical evils, and they now began to go much further. They began to attack the whole ecclesiastical system, and even the received doctrines of the Church. It was held that heresy was a crime at common law; but as a matter of fact, religious dissent of any kind was rarely heard of in England from the earliest times till the fourteenth century. The most remarkable case in earlier times was in the reign of Henry II., when a company of foreigners, belonging to some of the sects of Southern Europe, succeeded in making a single English proselyte. But the teaching of Wickliffe in the fourteenth century was the beginning of the religious changes of the sixteenth century. Wickliffe, the founder of a sect which suffered much persecution, can hardly be said to have been persecuted himself. His doctrines led directly to the unlawfulness of the whole ecclesiastical system, and specially to the unlawfulness of ecclesiastical property. Those doctrines he sent forth his poor priests to teach; but he himself lived and died in quiet possession of the rectory of Lutterworth. A reformer, theological, moral, and political, he allied himself with John of Gaunt, as the Puritans did in after times with Robert Dudley, though the duke's schemes of reform were certainly of a more earthly kind than those of the doctor. But this union came to an end when another side of Wickliffe's teaching, one which was doubtless not designed by Wickliffe himself, came into notice. This age was beyond all others the age of social change, or at least of events which led to the greatest social change. Causes which had doubtless been working long before came to a head under the joint influence of a fearful physical stroke and of the new religious teaching.

The Black Death;

its social effects.

We may safely set down the great plague of 1349, known as the Black Death, as the greatest of all social landmarks in English history. While the chivalrous king was keeping the feast of the foundation of the Order of the Garter, half the inhabitants of his kingdom were swept away by the pestilence. The natural results followed. We have seen that one of the gradual results of the Norman Conquest was to fuse together the churls, the lowest class of freemen, along with the slaves in the intermediate class of villains. By this time personal slavery had pretty well died out; but villainage was still in full force. But various causes—among them the frequent emancipation of the villains—had called into being a class of free laborers alongside of the villains. When the plague cut off so large a proportion of the whole people, labor became scarcer, and higher wages were naturally demanded. Parliament after parliament, beginning in the very year of the Black Death, tried, in the interests of the employers of labor, to keep wages at their old rate. The Good Parliament itself did not shrink from this selfish and impossible attempt. The discontent caused by these statutes, the general stirring of men's minds of which Wickliffe and the Vision of the Ploughman are alike witnesses, led, under the preaching of some of Wickliffe's wilder and fiercer disciples, to the great peasant outbreak of 1381, the insurrection which has chiefly become famous through the story of Wat Tyler. The young king, undoubtedly outstripping his legal powers, promised freedom to all the villains. This promise the next parliament not unnaturally refused to confirm. Two results followed. Though the villains were not at once emancipated, yet from this time villainage gradually died out, as slavery had already died out. Neither institution was ever abolished by law; but all the slaves gradually became villains, all the villains gradually became freemen. By the end of the fifteenth century, villainage was hardly known, except here and there on ecclesiastical estates. The clergy had always preached the emancipation of the villains as a good work. Yet they were the slowest of all landowners to emancipate their own villains. In this there is no real inconsistency. The layman might do what he would with his own; he might dispense with services owing to himself. Those who were at any moment the members of an ecclesiastical corporation might be held not to have the same right to emancipate their villains, that is, to make away with the rights of the corporation itself.

The revolt of the villains.

Gradual dying out of villainage.

Lollardy discredited by the revolt.

The other great result of the peasant uprising was to associate in men's minds the two ideas of religious reformation and political, or rather social, revolution. Wickliffe was himself as guiltless of the revolt of the villains as Luther was of the Peasants' War or of the reign of the Anabaptists. But in both cases the teaching of the more moderate reformer had a real connection with the doings of the reformers who outstripped him. From this time Lollardy, as the teaching of Wickliffe was called, was under a cloud. It was held to be all one, not only with heresy, but with revolution. Wickliffe himself died in peace; but for the few years that he outlived the revolt, he lost all political influence and political support. The reign of Richard was hostile to the ecclesiastical order at home and abroad. Yet it produced in 1382 the first statute against heresy, the penalties of which did not go beyond imprisonment. It was regularly passed; yet the Commons in the next parliament expressly demanded that it should be declared null. The first statute for the burning of heretics dates from the reign of Henry IV., from which time the stake was their legal doom. But the number of heretics to burn was not great. The most famous victim was Sir John Oldcastle, Lord Cobham, who was hanged and burned under Henry V. on a combined charge of treason and heresy. Thus far the political character of Lollardy shows itself. But through the rest of the fifteenth century, though we ever and anon hear of a martyrdom, religious dissent was so thoroughly discredited as to be of no political importance.

Statutes against heresy.

Language and literature; triumph of English over French.

Wickliffe was thus the direct author of a religious change. He was indirectly, if not the author, at least the unintentional abettor, of a social and political change. His place in the history of English literature is at least equal to his place in religious and political history. He was the father of later English prose writing. Since the sudden close of the Peterborough Chronicle, English prose writing had never quite died out, but it had remained something quite secondary by the side of English verse. But in the fourteenth century the English language again won back its own place. Now that the English nation had been formed again in its new shape, it was needful to proclaim the fact to the world by some unmistakable outward sign. That sign was found in the restoration of the national language to its rights as the acknowledged speech of the land, and that restoration was brought about by the same cause which first showed the regenerate English nation in the character of a great European power. It was the French war which completed the triumph of the English tongue. The men who had overcome the French enemy on his own soil could not endure that the French tongue should remain in use on the soil of England even as the speech of fashion. In the course of Edward III.'s reign English displaced French as the speech of education and as the speech of the courts of law. Statutes are still drawn up in French, but speeches in parliament are now in English. The ministers of the crown address the houses, and Henry of Lancaster claims the crown, in the native speech of the land. At last, under Henry V., negotiations were carried on with France by ambassadors who knew not the French tongue. From this time the use of French in public documents, a use which still lingered till the end of the fifteenth century, was as mere a survival as the two or three formulæ which are couched in French still.

Changes in the English language.

Thus after the ups and downs of three hundred years, English was now again the acknowledged speech of England, the one common speech of Englishmen of all ranks. But the ancient tongue, in winning back its ancient place, had greatly changed its ancient character. The two great changes in language which the effects of the Norman Conquest had rather strengthened than begun, the loss of inflexions and the constant introduction of foreign words, had had more and more effect as the speakers of the two tongues grew closer together, as the use of one or the other marked no longer a national but merely a social distinction. The English tongue which thus, in the course of the fourteenth century, won back its place from French, was a form of English which had lost or corrupted most of the old grammatical forms, which had adopted a crowd of foreign words, and which had even displaced many English words to make way for them. Still the unbroken continuity, the personal being as it were, of the native tongue remained untouched. We may say that in one age French displaced English, that in another age English displaced French. But the English tongue always remained the English tongue. The tongue of Chaucer did not displace the tongue of Beowulf; the elder form of the language changed into the younger by gradual and imperceptible shades. The fourteenth century was one of the great periods of English literature. The devotional vein which had never ceased, the satirical vein which had begun—most likely begun again—in the thirteenth century, flowed together in the fourteenth to form the great work, religious, moral, and social, of William Langland, the Vision of Piers the Ploughman. And after the English poet of the people soon came the English poet of more courtly life and more courtly speech in the person of Geoffrey Chaucer. And alongside of these more famous names we have a considerable mass of verse, political and satirical, on the events of the times. But while a hundred years earlier compositions of this kind were written indifferently in three languages, we have them now in two only; they are written in Latin and in English, but never in French. We have indeed one French chronicle of this time, that which records the deposition and death of Richard; but it is the work of a Frenchman. But it is now that English prose comes to the front in the hands of Wickliffe, in the form of his translation of the Bible and of his countless popular tracts. From his time a series of prose writers has never failed us. The English version of the travels of Sir John Mandeville in the fourteenth century, the theological writings of Bishop Reginald Peacock in the fifteenth, carry on the series from the days of the great master. Prose history in English does not appear in the fourteenth century, and it is of small importance in the fifteenth. But that is the case with our history generally. The old series of the Latin historians of England is but feebly represented in the fourteenth century, and it can hardly be said to be represented at all in the fifteenth. The great school of St. Albans comes down to Thomas of Walsingham and Abbot Whethamstead. But we now look in vain at St. Albans for successors of Matthew Paris, as we look in vain elsewhere for successors of William of Malmesbury or William of Newburgh.

Summary.

It is therefore not too much to say that, in the course of this period, the period of the Hundred Years' War, England finally took its modern shape. The essence of the constitution, the main points of the law, the dominant language, all took a shape which has since been changed only in detail. In all these things the formation of the England that was to be was brought to perfection in this age. And if the remaining distinctive characteristic of England was not brought to perfection in this age, the first steps to it were already taken. The papal claims were narrowly limited by law; ecclesiastical revenues were alienated by authority of parliament; if strictly religious reformation obtained no legal sanction, yet its seeds were now for the first time sown in the heart of the people. And if this was the age when the main features of English political life put on their present form, it was no less so with the main features of English social life. The distinguishing elements of English society, the peer as distinguished from the continental noble, the country gentleman, the farmer, the free laborer—all of them elements so specially English—all take nearly their present shape during this time. Villainage, if not actually abolished, received its deathblow. The mingling of classes is shown even by the oligarchic statutes which tried in some measure to hinder it. Esquires had long represented shires as well as actual knights. The rich citizen could buy a landed estate, and in a generation or two his children counted as esquires. The towns were growing in wealth and political importance, but their internal constitutions were getting narrower. The law was administered by nearly the same courts as it is now, and the abundance of lawsuits kept all courts, great and small, fully supplied with business. This growth of the law, the specially English law, statute and common, led to the rapid growth and increasing importance of the class of professional lawyers, men who practised the statute and common law of England, as distinguished from the professors of the law of Rome, civil and canon. Their importance is shown in the fourteenth century, by a petition of the Commons that the practitioners of the law might not be returned as knights of the shire; it was more terribly shown towards the end of that century in the bitter hatred towards the whole lawyer class which was shown in the peasant revolt. But notwithstanding both laws and lawyers, we find that powerful men, to say nothing of the king himself, were often able to interfere with the due administration of the law. But this fault is common to all lands. What is specially English is that, though the law was often broken, yet the law remained to rebuke those who broke it, and to triumph over them in the end.

Advance of domestic architecture.

Thus, on the whole, practical peace and order, as well as constitutional freedom, steadily advanced during this age. Not the smallest sign of its advance is the marked improvement in domestic architecture. The style which came in with the latter half of the fourteenth century and went on in use during the fifteenth, is commonly looked on as a decline from the style of the thirteenth and early fourteenth century. Yet, even as applied to churches, this style is not without its own merits, and it is the characteristic domestic style of England. Up to the end of the thirteenth century, we have but small remains of houses, houses as distinguished from castles and not built within the walls of a town. But in the fourteenth and fifteenth centuries England was covered with houses of all classes, manor-houses, parsonages, houses of substantial yeomen, of wood or stone according to their district, often excellent examples of the architecture of the time, and witnessing to the general state of security in the greater part of the country. We at once contrast them with the houses of the same and of a much later date on the Scottish border and in Ireland, where the esquire and the priest still had to live for safety's sake in the pele-tower. This last is in truth nothing but a continuation of the square Norman keep in a smaller and ruder form. In short, in England security, liberty, and political rights were spread over the whole country. They were not, as in most other lands, confined to the inhabitants either of fortified towns or of private strongholds.

Three hundred and fifty years of struggle had thus made England once more fully herself after the great overthrow of the Norman Conquest. In a formal narrative of English history, our tale would now, as it draws nearer and nearer to our own time, be fittingly told in greater detail at each stage. In a sketch like the present the opposite process would seem to be no less fitting. We now know what England is. She has made herself; she has won her rights; she has now to defend, to secure, when needful to reform; she has no longer any need to create. The only exception is with regard to her religious history. In other respects all that has henceforth to be done is to keep what has already been gained. In the religious department alone, there is still something to be gained, something, if not to be created, at least to be put into a wholly new shape. This great period of three hundred and fifty years, broken, as we have dealt with it, into several smaller periods, this period of creative struggle, is followed by another great period of about two hundred and fifty years. This is still a time of struggle, but in political matters of mainly defensive struggle, while in religious matters the struggle is still, in a lower sense, creative. This long period again falls into three smaller periods. The first is the time of the civil wars of York and Lancaster, a time during which the fabric of freedom which had been built up with so much toil begins to yield, in outward appearance at least, to the growth of an almost despotic power in the crown. Then comes the time of Tudor dominion, the time which, while it saw the greatest development of royal power, saw also the great religious change which was needed to complete the later character of England. Lastly, there is the time of renewed struggle, political and religious alike, against the feebler despotism of the Stuarts. Of these three periods, the first, answering nearly to the second half of the fifteenth century, has little religious interest. In the second, answering nearly to the sixteenth century, though the political interest is great, the religious interest surpasses it. In the third period, answering nearly to the seventeenth century, the religious and the political interest go side by side. But through the whole both of the sixteenth and seventeenth centuries it is the importance of the religious interest which gives the period its special character. While, in political matters, men are simply striving to preserve or to win back an old freedom, in religious matters they are striving to establish a wholly new freedom.

The Wars of the Roses.

Beginning then, as before, with the most prominent outward characteristics of the several periods, the feature which first strikes us is that the hundred years of foreign war are followed by a period of about half the length, the chief feature of which is the great civil strife of the fifteenth century, the strife between the houses of York and Lancaster, commonly known as the Wars of the Roses. It would seem as if the failure of schemes of continental dominion on the part of England had driven Englishmen to spend their energies in biting and devouring one another at home. The fifty years after the final loss of Aquitaine form a time which, especially towards its end, is of much importance in other ways. But this feature of constant civil war, war waged to settle the disputed succession to the crown, is that which gives to the time its most distinguishing character. Wars with Scotland and with France go on very much as before. One year there is a raid; the next year there is a truce. But warfare of this kind is of little importance in a general view of the period. All hope of the conquest or serious dismemberment of either of the hostile countries has passed away. The origin of this great civil strife was to appearance purely genealogical. The claim of Roger earl

Claims of the house of York.

of March to succeed Richard II., by virtue of descent in the female line from an elder son of Edward III., showed the new doctrines in their extremest form. But all claims on this score had been set aside by the repeated acts of parliament which gave the crown to Henry IV. and his heirs. No title could be better than that of the Lancastrian kings; and amid the glories of the reign of Henry V., the genealogical fancy which was all that could be pleaded for the other family seems gradually to have been forgotten. But, just about the time of the loss of Aquitaine, a number of circumstances joined together to give a renewed importance to their claims. Those claims had now passed to Richard duke of York, who in the male line represented a son of Edward III., younger than John of Gaunt, but who in the female line represented the elder brother Lionel. The weakness of Henry VI., sometimes growing into absolute imbecility, was now manifest. His foreign queen and his ministers, the dukes of Suffolk and Somerset, were unpopular on various grounds, specially on account of the losses in France. Duke Richard, on the other hand, was an able and popular nobleman, who had won reputation both in France and in Ireland. As long as Henry was childless, he might be looked on as heir presumptive to the crown. The only possible competitor was the duke of Somerset himself.

The Beauforts.

Somerset represented a branch of the royal family which was of doubtful legitimacy, that of the natural children of John of Gaunt, who had been legitimated by Parliament, but whose position as regarded the royal succession was not clear.[1] In 1450 a popular insurrection under Jack Cade, who called himself Mortimer, might pass for a sign that the claims of that family were not forgotten. The duke of Suffolk, impeached by the Commons, but not sentenced by the Lords, had been irregularly put to death. Somerset now remained as that unpopular minister, while Richard of York was the leader of a popular opposition. The birth of the king's only son in 1453 took away the duke's hope of a peaceful succession, and in 1455 the civil war began.

Duration of the civil war.

The war of York and Lancaster, like the great war with France, with its occasional lulls and truces, must be looked on as really lasting, notwithstanding reconciliations, restorations, and momentary reigns, from the time when the sword was first drawn against Henry VI. to the time when it was last drawn against Henry VII. One thing is to be noted throughout, that, after every revolution, a parliament was always found ready to condemn the defeated side and to acknowledge the rights of the conqueror. Thus, in the early stage of the war, the duke of York was attainted in 1459.

Duke Richard made heir to Henry VI.

In 1460 the victory of Northampton put him in a position to make good his claim to the crown. A compromise was brought about by the Lords, which sounds as if it had been suggested by the treaty of Troyes. By their award it was agreed that Henry should keep the crown for life, but that the duke should displace the king's son in the rank of heir apparent. Such an award implied the admission of the new doctrine of absolute hereditary right in its extremest form. At the same time it saved the personal rights of the crowned king to whom the claimant had sworn allegiance. But this settlement on paper had no practical effect. The queen and the lords of her party disregarded it. In 1460 Duke Richard fell at Wakefield, and his claims passed to his son Edward. The compromise was now set aside on both sides. Henry had joined, or had been made to join, the queen's forces after the victory of Wakefield. The Yorkist doctrine was that, by so doing, he had broken the award, and had thereby forfeited the crown, which therefore passed to Edward. The claims of Edward were confirmed by a kind of popular election in London.

Edward IV.

After his crowning victory at Towton followed his coronation, and a fresh parliamentary settlement, which declared the victor of Agincourt an usurper. The reign of Edward IV. is now held to begin; but the war was not yet over. Margaret sought help in Scotland and France, and Scottish help was bought by the surrender of Berwick. The war began again in 1463, and this stage of it may be looked on as ended by the Yorkist victory at Hexham in 1464. The next year Henry was captured. But by this time Edward had taken a step which led to the estrangement of his most powerful supporters. His marriage with one of his subjects, Elizabeth Grey, and the growing influence of her family, the Woodvilles, began to offend the house of Neville, and its head Richard earl of Warwick.

Restoration of Henry.

After a series of almost unintelligible intrigues and insurrections, Edward was in 1470 driven out of the kingdom by a union between Warwick, and the king's own brother, George duke of Clarence. Henry VI. was now taken from prison and again declared king. The crown was settled by parliament on him and his son, with remainder to Clarence. But in the next year Edward came back; Clarence again changed sides, and the crown was secured to Edward by the fights of Barnet and Tewkesbury. At Tewkesbury Edward the son of Henry was killed; the death—we may feel sure that it was the murder—of Henry himself followed. The legitimate male line of Lancaster was now extinct; no descendant of any one of the sons of Henry IV. survived. There were foreign princes descended from John of Gaunt in the female line, and among them the famous Charles duke of Burgundy, who seems, among the other objects of his ambition, to have sometimes dreamed of the English crown for himself. Such claims were not likely to meet with any support in England; and Edward, by a stroke of real policy, won Charles to his side by the hand of his sister Margaret, and found shelter at his brother-in-law's court during his exile. In England the hopes of the Lancastrian party now turned in a new direction, to legitimated descendants of John of Gaunt of the house of Somerset. That house also was extinct in the male line;

Henry earl of Richmond.

its representative was Margaret, countess of Richmond. Her young son, Henry Tudor, earl of Richmond, was now, in the lack of any better claimant, looked on as the heir of Lancaster. It is needless to say that no genealogical subtlety could be held to give him any share in the royalty which the choice of the nation had conferred on the line of Henry IV. But something of the sentiment of royal descent might be held to have come to Henry in a strange way through his father's mother. She was no other than Katharine of France, the widow of Henry V., who married a Welshman named Owen Tudor, in whose descendants the crown of England passed, by a strange genealogical accident, to the ancient stock of Britain.

Second reign of Edward IV.

For the remaining twelve years of his life Edward IV. reigned without any important disturbance at home. But the members of the house of York had already begun to turn one against another. The validity of Edward's marriage, and therefore the legitimacy of his children, was doubtful. Clarence was in any case the next in succession after them, while, by the statute passed during Henry's second reign, he had a claim before Edward himself. In 1478 this dangerous brother was condemned in parliament on a vague charge of treason; and he presently died, though not by any public execution. The latter years of Edward IV. were taken up chiefly with foreign policy and foreign war, both of which were on rather a small scale. A Scottish war from 1480 to 1482 is remarkable for the recovery of Berwick. In continental politics Edward was specially busy. His policy took largely the form of planning foreign marriages for his children, none of which were carried into effect. Even before he was driven out in 1470, he was trying to form alliances against France, especially with Charles of Burgundy. But, though Charles sheltered Edward in his exile, he gave him no real support when in 1475 he actually began an invasion of France. Edward, as well as Charles, was outwitted by Lewis XI. The king and his counsellors went home without glory or conquest, but with large bribes of French money.

Protectorate and reign of Richard III.

The death of Edward in 1483 again, nominally at least, gave the crown to a minor, Edward, the eldest son of the late king. The suspicions which had been vaguely raised against John of Gaunt during the minority of Richard II. became realities in the case of the ambitious uncle of Edward V. This was Richard duke of Gloucester, the youngest son of Richard duke of York, who was declared protector of the young king. His protectorate was marked by the illegal slaughter of several of the lords of the party of the queen mother. Presently Richard's own adherents claimed the crown for him. The claim was based on the alleged invalidity of Edward IV.'s marriage. Some ventured on the more improbable scandal that neither Edward nor Clarence was really a son of Duke Richard, and that Richard of Gloucester was his only real representative. A more decent argument was found in the attainder of George of Clarence, which, it was held, shut out his children from the succession. An irregular kind of election, which however professed to be made by the estates of the realm, called on Richard to assume the crown. He was crowned instead of his nephew; and there can be little doubt that both Edward and his brother Richard duke of York were made away with, like Arthur in earlier days, at the bidding of their uncle. The ancient custom of England would have spared all these crimes. Richard, who had in other respects many of the qualities of a good ruler, would doubtless have been chosen on the death of his brother. As it was, his crown was at once threatened by Henry of Richmond, who now passed for the representative of the house of Lancaster. The aim of his party was to marry him to Elizabeth, daughter of Edward IV., who now represented the more regular succession of the house of York. Richmond was in banishment in Brittany. The first attempts of himself and his partisans were crushed. At this stage of our history everything turns on marriages and genealogies. The deaths of Richard's queen Anne Neville and his son Edward open a new stage in the tale. John earl of Lincoln, the son of the king's sister Elizabeth duchess of Suffolk, was now declared the presumptive heir. But Richard now designed a marriage with his own niece Elizabeth, to which she and her mother seem to have consented. This plan hastened the schemes of Richmond. He landed, raised an army, and, helped by the treachery of the Stanleys and Percies, he overthrew Richard at Bosworth, August 22, 1485. Henry was crowned, and a parliament settled the crown on him and the heirs of his body, and none other. The new king clearly wished that his claims should be in no way dependent on his intended marriage with Elizabeth. Parliament, on the other hand, was clearly unwilling to give its formal sanction either to a right of conquest or to Henry's strange hereditary claim. Henry, in short, reigned by a parliamentary title, by an election which followed his coronation. In the next year however he carried out his promise of marrying Elizabeth; and, before the end of the year 1486, the birth of his eldest son, who, as the son of the first British king of England, received the name of Arthur, seemed to put the succession on a sure ground.

---

[1] The case of the Beaufort family, earls and dukes of Somerset, is clearly stated by Lingard, iii. 357. The original patent of 1397 did not in so many words except the succession to the crown, but it did so by implication, by making the persons legitimated capable of all dignities short of the crown, but making no mention of the crown itself. In the later copies the crown was expressly excepted.

Accession of Henry VII.

Position of Henry.

We are apt to look on Henry VII. as the founder of a dynasty, and on his reign as marking the beginning of a new æra. Both views are true; but they must not be allowed to put out of sight the fact that, till quite the end of his reign, his throne was as insecure as that of any of his predecessors. The civil wars were not yet ended; in foreign lands Henry was looked on as a mere adventurer, who had won the crown by the chances of one battle, and who was likely to lose what he had won by the chances of another. Hence he was, like Edward IV. in the same case, specially anxious to establish his position among foreign princes. To obtain, as he did at last, an infanta for his son, even to give his daughter to the king of Scots, were in his view important objects of policy. But those objects were not attained till after he had strengthened his position at home by successfully withstanding more than one enemy.

Revolts against Henry.

The revolts against Henry began early. Before the birth of his son, he had to crush the first insurrection of Lord Lovell. The next year enemies arose against him in Ireland. There the rule of the elder duke of York had been popular, and the Yorkist party had always been the stronger. A claimant appeared, one Lambert Simnel, who professed to be Edward earl of Warwick, son of George duke of Clarence, the male representative of the house of York. Edward was indeed alive in the Tower, and was shown in public to prove the imposture. Yet Simnel was crowned in Ireland, and was presently supported by John earl of Lincoln, who had been himself declared heir presumptive under Richard. The impostor and his partisans landed in England, and were overthrown at Stoke-upon-Trent. In 1492 another and more dangerous claimant, who professed to be Richard duke of York, the son of Edward IV., and whose real name was understood to be Perkin Warbeck, appeared also in Ireland. His cause was taken up by more than one foreign potentate, by James IV., king of Scots, and by Margaret, the duchess dowager of Burgundy, who, if he was what he pretended to be, was his own aunt. He made more than one attempt at invasion, some of them in company with the king of Scots. Meanwhile, early in 1497, the men of Cornwall rose and marched as far as Blackheath, close to London. There they were defeated; but when, a few months later, Perkin landed in Cornwall, he found enough support there to besiege Exeter. But he shrank from a battle with the royal army; he submitted to the king, and was put to death in the next year, 1499. Immediately afterwards followed the beheading of Edward of Warwick. From this time, for the last ten years of his reign, Henry reigned in safety.

Establishment of his power.

The wars with France still lingered on, and in 1492 Henry had actually undertaken the siege of Boulogne. The enterprise was however ended by a treaty of peace. After Henry's throne was secured by the deaths of Perkin and of Edward of Warwick, his European position speedily rose. In 1501 Katharine of Aragon was married to Arthur, and, on his death in the next year, she was contracted to his younger brother Henry. Earlier in this year, 1502, a treaty of peace was concluded with Scotland, which was followed in 1503 by the marriage of James king of Scots and Henry's elder daughter Margaret. This marks an æra in the relations between England and Scotland. Up to this time, ever since the enterprise of Edward Balliol, there had been constant warfare, interrupted only by truces. Now, for the first time, a peace, strictly so called, was concluded. All claims either to the crown of Scotland or to a superiority over it on the part of England must be looked on as being finally given up. There was still more than one war between England and Scotland before the union of the crowns; but the state of constant warfare broken only by truces now comes to an end.

Peace with Scotland.

Beginning of the Tudor period.

In 1509 Henry VII. died. His eldest surviving son, Henry VIII., who now united the claims of York and Lancaster, succeeded without a breath of opposition. He was the first king since Richard II. who reigned by an undisputed title; and he was, strangely enough, the last king who was formally elected in ancient fashion in the ceremony of his coronation. With him, rather than with his father, a new period opens; or, more accurately still, the new period opens with the second period of Henry VII.'s reign, after all opposition to his title had passed away. When the first Tudor king felt himself safe, the Tudor despotism began. Under the second Tudor king that despotism allied itself with ecclesiastical change, and the sixteenth century put on its most characteristic aspect.

Causes of change in Europe; their effect on England.

It was during this period that England came within the range of those general causes of change which were now beginning to affect all Europe. The revival of learning, as it is called, was now spreading from Italy into other lands. The three great inventions which in the course of the fifteenth century affected the general state of mankind, gunpowder, printing, and the compass, began in the course of the second half of that century to do their work on England also. The Wars of the Roses differ widely, in their military character, from the civil wars of earlier times. The personal displays of chivalry in the field, as well as the older style of fortification, became useless before the new engines of destruction. But, above all things, it was during this time that, in most parts of Europe, the chief steps were taken towards that general overthrow of ancient liberties which reached its highest growth in the sixteenth century. Europe was massing itself into a system of powers, greater in extent and smaller in number, than heretofore. The masters of these powers were learning a more subtle policy in foreign affairs than those who went before them, and they were beginning to rest their trust at home on standing armies. We have reached the time of Lewis XI., and of Ferdinand of Aragon. While France had grown by the annexation of nearly all its vassal states, and of some states which were not its vassals, the new power of Spain was growing up, to develop in the next period into the gigantic dominion of the house of Austria. Italy, with the mass of its small commonwealths grouped together

Growth of the royal power.

among a few larger states, some princely, some republican, becomes during this age the battlefield of the rival powers. This new state of things was not without its influence on England, though our insular position saved us from being so completely carried away as the continental nations. The power of the crown grew to a pitch which was altogether unknown at any earlier time except under the Conqueror and his immediate successors. Parliaments become more servile; sometimes they are dispensed with altogether. Arbitrary acts on the part of the crown are perhaps not more common than in earlier times; but they take a new character. When law is generally weak and is easily broken, the king's breaches of the law do not seem very different from breaches of the law on the part of other men. When the king has become powerful enough to enforce the law on other men, but fails to observe the law in his own acts, the fault is of another kind. It is no longer general lawlessness, but deliberate arbitrary rule.

Character of the Wars of the Roses.

It was to this state of things that England was tending during the whole of this time. The stir of civil war alternated with the repose of despotism. It might almost be said that the two went on side by side; for the Wars of the Roses were not a period of anarchy like the wars of Stephen and Matilda. The crown was fought for by contending princes at the head of great armies; but there was little or nothing of the wasting local and personal warfare of the earlier time. Except where the actual strife was waging, things went on much as usual. The king in possession was obeyed wherever his enemies were not in military occupation. After each revolution a parliament was ready to approve the change, to acknowledge the conqueror, to regulate the succession according to his pleasure, and commonly to attaint the defeated prince and his supporters. It marks that the age of revolution was drawing to an end when the famous statute of Henry VII. declared that no man would be called in question for adhering to a king in possession, be his title good or bad. The care taken by every claimant of the crown to obtain a parliamentary acknowledgment of his right was at once a homage paid to the formal authority of parliaments and a heavy blow struck at their moral weight.

Parliaments of the time.

The parliaments of this time were fast losing the spirit of the elder parliaments. The number of the temporal lords was lessened by battles, executions, and banishments. The spiritual lords had become more thoroughly servants of the crown than at any time since the twelfth century. The lower house had also undergone a change. In one sense its position had risen. The place of representative of a city or borough was now sought for by men who were not actual citizens or burgesses. And, owing to the restrictive statute of Henry VI. and to the change in the constitutions of the boroughs, both knights and burgesses were now chosen by less popular constituencies than those who chose them in earlier times. Yet, low as parliaments had fallen from their ancient standard, they still kept virtue enough for kings to dread them.

Attempts of the kings to reign without parliament.

Every king of this age who deemed himself safe on his throne tried to reign without a parliament. During the first reign of Edward IV., parliament met, formally at least, with one exception, every year. In the latter part of his reign five years passed without a parliament. So it was with Henry VII. Parliaments were frequent while insurrections were frequent. The last eleven years of Henry's reign saw only a single parliament. On the other hand, Richard III., whose throne was not safe during a moment of his short reign, was the least unconstitutional king of this period. He had time only for a single parliament, but that was a parliament rich in legislation, and which passed one great law restraining a special abuse of royal power. Edward IV., in the times when he dispensed with parliaments, brought in a practice of gathering what were called *benevolences*, gifts to the crown which were nominally freewill offerings, but which it was dangerous for the subject to refuse. These benevolences were expressly declared illegal by the statute of Richard. But Richard himself broke his own law; and later kings found it convenient to follow his practice rather than his legislation. And when the statute of Richard was quoted against them, they were not ashamed to plead that the act of the usurper was of itself null.

Comparison of England with continental countries.

This then was the time of trial for England and her liberties. She and they were now full grown, and their strength had to be proved. Her probation went on for more than two hundred years; but now it began. In the end the nation and its liberties proved too strong for the kings. Parliaments were bullied, packed, and corrupted; their sittings were stopped for years together; but they were never abolished. The great laws which secured freedom were often broken, but they were never repealed or set aside. At the beginning of this period the distinction between an absolute and a limited monarchy was as clearly drawn out by a minister of Henry VI. as it could be by any modern political writer. And, if the practice did not always conform to the model traced by Sir John Fortescue, the law always did. The old principles of freedom were never so utterly forgotten, never so utterly trodden under foot, that they could not be called to life again when the favorable moment came. In this, it is plain, the history of England differs from the history of France, of Spain, of most continental countries. And certainly one reason for the difference was that they were continental countries, while England is insular. Constant rivalries, constant warfare with immediate neighbors, gave better pretexts for the maintenance of standing armies than could be found in England. The only immediate neighbor of England was Scotland. And the wars with Scotland, though working constant damage to the border shires, were not so dangerous to the kingdom in general that either prince or people would have dreamed of keeping up a standing army on their account. And, after Henry VII.'s treaty, war with Scotland ceased to be the regular state of things. Our kings therefore, without a standing army, could not utterly root out freedom as their continental brethren did.

Illegal doings of the kings.

In the worst times they were driven to summon parliaments from time to time, and those parliaments now and then showed traces of the old spirit. Still from this time onward the administration becomes highly arbitrary. The king and his council were guilty of constant illegal interference with the liberty of the subject. The court of Star-Chamber, an offshoot from the Privy Council and so from the old *curia regis*, though sometimes useful in punishing offenders who were too strong for the ordinary course of law, became a terrible engine of oppression.

Torture.

It is characteristic of the time that judicial torture, unknown at all times to English law, and unknown to English practice at all times before the fifteenth century and after the seventeenth, now began to be freely used. But it was used in every case by a special and illegal exercise of prerogative. No man was ever tortured to extort confession in any of the regular courts of English law.[1]

Frequent executions.

The age which brought in the rack could hardly fail to be a merciless age. In fact the civil struggles of each age had, from the twelfth century onwards, been getting more and more bloodthirsty. During the Wars of the Roses each revolution, each battle, was followed by something that might be called a massacre, by a general slaughter of the leading men on both sides. On the other hand, the slaughter was mainly confined to the leading men. But the murders or executions wrought at every stage of these wars undoubtedly had a political effect in lessening the numbers of the old nobility to a degree which mere slaughter in battle could never have done.

Acts of attainder.

In this age too began the general practice of attainder by Act of Parliament. That is, a man is placed by a legislative act in the same position as if he had been convicted after a regular trial. This process was now freely used, not only against the living, but sometimes against the dead. The main object in the latter case was of course the confiscation of the estate of the attainted person. It at first sight seems singular that the man who stands out as the foremost actor in the cruelties of this time was the man who was also foremost as a scholar and patron of learning. This was John Tiptoft, earl of Worcester, who in the one character was bewailed by Caxton, while in the other he gained the popular surname of the Butcher. But Tiptoft brought his learning from Italy; he was in fact the first fruits of the Italian *Renaissance* in England. And the Italian *Renaissance*, if it was a school of taste and learning, was hardly a school of either justice or mercy. Arbitrary power cruelly exercised can easily exist alongside of learning and refinement. This truth England began to learn in the present period. It learned it yet more thoroughly in the next.

---

[1] Torture strictly so called, torture to bring the prisoner to confess, was never known to English law. It must not be confounded either with the painful form of death which formed the penalty of treason, or with the *peine*—more accurately *prisone*—*fort et dure*, the pressing to death, which was the fate of those who refused to plead.

The new learning.

The Tudor architecture.

Domestic architecture.

The Italian studies of the earl of Worcester were certainly not shared by many of the contemporary nobles. Yet before this time, Humfrey duke of Gloucester had appeared as a patron of learning, and the foundation of colleges in both universities went on through the whole of the fifteenth century. But the new learning, as it was called, that wider field of study of which Greek learning was the most easily recognized outward badge, hardly took root in England till quite the end of this period, under Henry VII. Caxton had already begun to print under Edward IV., at a time when the native literature of England had sunk lower than it ever sank before or after. Yet signs were not wanting that the practice of writing, and writing in English, was now widely spread. The Paston Letters, which let us into the inmost life of a knightly family of Norfolk, are worth any amount of courtly Latin. But they are hardly literature. Mediæval art too now entered on its latest phase immediately before its final overthrow. The architectural style of this time loses the aspiring lines of earlier times, and gives us instead a lavishness and intricacy of ornament, such as we see at St. George's at Windsor and in Henry VII.'s chapel at Westminster. But the architectural details are still for the most part pure. It is in tombs and wood-work that the *Renaissance* details first creep in, and that hardly till the reign of Henry VIII. But, just at the end of this period and the beginning of the next, English domestic architecture reached its highest perfection. Houses had now quite outstripped the alternatives of the period immediately before, when the choice lay between the fortress and the simple manor-house. In the latter part of the fifteenth century and the beginning of the sixteenth, we come to palaces, as distinguished from castles. Vast houses arose, where fortification was quite secondary or in truth had come to be a mere survival, and where we see the true English style just before it became corrupted. From Haddon Hall the series goes on, till in days which chronologically belong to our next period, we get such piles as Cowdray, Hampton Court, and the unfinished castle of Thornbury. These are buildings of the reign of Henry VIII.; but the architectural periods cannot be made exactly to fit in with the more obvious divisions of our history. The buildings of Henry VIII.'s reign must be classed with those of the fifteenth century, rather than with those of the latter half of the sixteenth. The *Renaissance* did not affect architecture, as distinguished from furniture and decorations, till the time of Edward VI.

Commerce and discovery.

Discovery of America.

While two of the three great discoveries were causing a revolution in the worlds of warfare and literature, the third, the compass, was no less doing its work in its own region. Under Edward and Richard the commerce of England advanced swiftly. From the north-western seas it was now spread over the whole Mediterranean. At no time did it make greater advances than under Edward IV., who was a considerable merchant in his own person. In Henry VII.'s days the New World was thrown open to the adventurers of the Old. As far as mere discovery went, England had, before the end of the fifteenth century, her full share in the work through the American discoveries of Sebastian Cabot. But, as far as England was concerned, it was as yet mere discovery. The time for English settlements beyond the ocean, or even for English enterprise in those distant waters, had not yet come. The path towards them was shown, and that was all.

Henry VIII. His position at the time.

Chronology of his reign.

We have seen that the civil wars really end, and that the time of unrestrained Tudor domination begins, in the middle of the reign of Henry VII. His later rule was the rule of a despot, who strove as far as might be to reign without a parliament. His desire to be independent of his people led to that rule of grasping avarice which has caused his rule to be chiefly remembered for the endless shifts by which his greed of money was satisfied. His reign is important chiefly as leading the way to the more brilliant time which followed, a time which can be understood only if we throw ourselves into the point of view from which men looked upon it at the time. The next king, Henry VIII., began his reign in two characters which at once marked it off from any reign since that of Henry V., we might almost say from any reign since that of Edward III. After a long time, during which the strength of England had been wasted in deciding in arms between rival pretenders to the crown, England had again a king whose title was undisputed, and who led Englishmen to conquest beyond the sea. That was the first aspect in which Henry VIII. appeared to England and to Europe. The real historical characteristics of his reign are different. The special features of his reign are the working of a despotism of a very peculiar kind, and the application of that despotism to work a great ecclesiastical revolution. But, though this last is the special characteristic of the age and the reign of Henry, yet it did not become a characteristic of his reign till he had already been many years on the throne. The acts which his name first suggests to the popular mind, the suppression of monasteries and the beheading of wives, do indeed effectually distinguish his reign from any other; but they are features which belong to the latter years of his reign only. They no more make up the whole of Henry's reign than the Scottish wars make up the whole of the reign of Edward I. During the greater part of Henry's reign the characteristic feature of the time seemed to be the unusually high place which England held in the general affairs of Europe.

European position of England.

Wars and alliances of Henry.

There was much in the general character of the age which helped to give England this special European importance. It was a transitional age; new ideas had come in, but the old ideas had not been wholly forgotten. The powers of Europe were now beginning to put on some approach to the shape and the relations to one another which they kept down to very modern times. We have come to the beginning of the long rivalry between France and the house of Austria. France had, on different grounds, hereditary enmities both with the empire and with the houses of Burgundy and Aragon. The pretensions of the French kings to the kingdom of Naples and the duchy of Milan were the chief cause of the long struggles in Italy in which all the neighboring powers had their share. Henry stood apart, and was eagerly sought by all as ally or as arbiter. Here is a wholly new state of things, the beginning of that wider system of European policy which deems that no European state is wholly without interest in the affairs of any other. We are on the road to the days of the doctrine of the balance of power. On the other hand, the old enmity between England and France had not died out, nor had the old grounds for that enmity been forgotten. The memories of the days of Edward III. and Henry V. are at this time strangely mingled up with political ideas which might be a century or two later. Henry is called in as the arbiter of Italy and of Europe. He is the defender of the pope and the enemy of the Turk. He dreams of the empire for himself, and of the papacy for his great minister. Negotiations and changes of side are endless. Of the two successive kings of France, Lewis XII. and Francis I., he is alternately the friend and the enemy. He has wars with both: yet he becomes the brother-in-law of Lewis and the sworn brother of Francis. When the empire and the powers of Castile, Burgundy, and Aragon were all united in the person of Charles V., the old alliance between England and Burgundy, and the far older alliance between England and the empire, united Charles and Henry for several years against Francis. Henry's very failure to obtain the imperial crown, seems not so much to have embittered him against the successful candidate as to have turned his thoughts towards the crown which he professed to claim by hereditary right. From 1519 to 1525, Henry and his imperial nephew seemed steady friends. From about this time till quite the end of Henry's reign, foreign affairs are almost sunk in the surpassing interest of events at home. But, as those events depended on the divorce of the emperor's aunt, the friendship of England at this stage leaned to Francis against Charles. But, amidst all these shiftings of friendship and enmity, the only real warfare in which England either did or suffered anything was waged with the two old enemies, France and her firm ally Scotland. The two periods of really active warfare under Henry come at the two ends of his reign. From 1512 to 1514 was a time of war, a time of victory on the part of England. The one year 1513 saw the defeat of the invading Scots at Flodden, and the conquest of Terouanne and Tournay by the king of England in person, with the emperor-elect as his ally, almost as his mercenary. All this within the space of a few weeks seemed to bring back the most triumphant days of Edward III. Again in 1522 and 1523 Scotland and France were both successfully invaded. Eighteen years later, in 1541, the Scottish wars began again; two years later England and the empire were again allied against France and Scotland. In 1544 England was again successful over both enemies: while the king in person took Boulogne, his brother-in-law burned Edinburgh and laid waste Scotland, as far as came under his power, with a barbarity which can certainly not be laid to the charge of Edward I. It is certain that England in the end gained nothing by either the negotiations or the warfare of the reign of Henry. But they are enough to account for the fact, which to us seems so strange, that Henry was, on the whole, popular during his life, and that his memory was cherished after his death. He was the last native king who in his own person waged war, and that successful war, on the mainland. His victories were useless; but they were victories; and, as such, they fed the national imagination. After the dreary time of the civil wars, England again stood forth as a great power, a conquering power, a power in some sort greater than it had ever been before. To the conqueror much was forgiven in the way of wrong-doing at home. More still was forgiven to the king who at last accomplished the work which Henry II. had begun but was not able to finish.

Character of Henry's despotism.

The traditions of arbitrary power and unscrupulous shedding of blood had been handed on to Henry by his predecessors, as far back as his Yorkist grandfather. It was the peculiar direction which was given to despotism and slaughter in the latter part of his reign which was wholly his own. The darkest side of Henry's character came more and more into prominence in his later years; but his rule was arbitrary, and on occasion bloody, from the beginning. He could from the beginning put men to death, either to gratify a popular cry or to shield himself from purely imaginary dangers. Empson and Dudley, the ministers of his father, had fully deserved the hatred of the people; but their execution, almost the first act of Henry's reign, could be justified on no possible ground of law. In the midst of Henry's French wars, in 1521, Edward Stafford, duke of Buckingham, was put to death, rather because his royal descent was deemed to make him dangerous than on account of any proved crime. But, in these and in all Henry's acts, we see that attention to formal legality which is the special characteristic of his reign. At no time, unless during the first years of the Conquest, was so much wrong done under legal form, and the Conqueror at least did not send those whom he despoiled to the scaffold. It would be going a great deal too far to say that all Henry's acts could be justified by the letter of the law of England; but it may be fairly said that he could always plead either law or precedent. For his worst acts he was always able to show at least some pretence of legal sanction; his tyranny never became a reign of mere violence. In his days law emphatically became unlaw. Parliaments legislated as he thought good; judges and juries gave such judgments and verdicts as he thought good; and, when their action was too slow, parliament was ready to attaint, even without a hearing, any one whom the king wished to destroy. When Henry's mind turned to ecclesiastical change, parliaments and convocations alike were ready to shape the creed of the nation according to the caprice of its ruler. That such a tyranny could in this way be carried out, never by mere force, often under strictly legal forms, makes the character both of the man and of the time a study of special interest. It is a time which specially deserves and needs an historian.[1] Here nothing more can be done than to trace its most general features.

Henry not a religious reformer.

He carries out the scheme of Henry II.

Abolition and denial of all foreign jurisdiction.

The ecclesiastical work of Henry's reign was not religious reformation in the sense in which those words would have been understood by Wickliffe or Luther. Henry now and then, in the endless shiftings of his course, looked in the direction of the German Reformers, but it was rather for political than for religious ends. One or two of his theological productions at one stage do indeed show a slight Protestant tendency on one or two points.[2] But this was only for a moment; Henry's later legislation went towards the establishment of the most rigid orthodoxy, according to the Roman type, in all matters of dogma. To the end of his days Henry and his prelates, Cranmer conspicuously among them, took care to send to the flames any who swerved in the least degree from the received doctrine of transubstantiation. Henry's scheme was to carry out in its fulness that after which earlier kings had so often striven, the complete emancipation of England from the power of the Roman see, and the transfer of the highest ecclesiastical jurisdiction to the crown. In this he did little more than put into a more distinct shape the authority which the Conqueror had exercised, and which Henry II. had striven to win back. The ancient kings had allowed the authority of the pope to be exercised only so far as they thought good; Henry threw it off altogether. The acts of 1534, which swept away the Roman supremacy, were the climax of the legislation which had been begun in the Constitutions of Clarendon, and which had been carried on in the statutes of Provisors and of *præmunire*. A few special points of Henry's legislation which were likely to give special offence lasted only during his own reign and that of his son. Such were the title of Head of the Church, and that personal jurisdiction in ecclesiastical matters which Henry claimed to exercise either by himself or through his vicar-general. Such again were the commissions from the crown which were taken out by bishops under Henry and Edward. These things formed no essential part of the royal supremacy. They were abolished under Mary, and they were not re-established under Elizabeth. The essence of the change which Henry wrought was the abolition of all foreign jurisdiction within the island realm. And it must not be forgotten that, though the Roman bishop was chiefly aimed at, the Roman emperor was aimed at also. It was not without reason that the ancient imperial style of England now reappears. Since the Conquest the use of that style had been rare, and the instances of its use always mark some special need of the time. Its increased frequency under Henry marks a special need of his time. When the imperial power was in the hands of Charles V., and when Charles V. was an enemy, it was not without reason that it was declared that the kingdom of England was an empire, and that its crown was an imperial crown. Separation from the see of Rome was not meant to carry with it any change of doctrine, or to imply any breach of communion with the churches which remained in the Roman obedience. It was strictly a scheme of ecclesiastical independence, and no more. But the acts of Henry put on a peculiar character from the circumstances which led to his ecclesiastical changes, and from the way in which many of them were carried out. And, when ecclesiastical change had once begun, it could not fail to ally itself with other influences, however little such alliance formed any part of the scheme of Henry himself.

The Reformation: its nature.

Its character in England.

In strictness of speech, the English Reformation, if by those words we understand changes in doctrine and ritual, is quite distinct from Henry's assertion of the ecclesiastical independence of England. In idea the two things stand quite separate. Practically the two form two stages in a great series of cause and effect. The system of Henry has been epigrammatically described as Popery without the Pope. And the experience of a few years showed that Popery without the Pope was a visionary scheme. But the various stages which are often confounded under the one name of "the Reformation" must be carefully distinguished. There was not in England, as there was in some foreign countries, a particular act of a particular year which might fairly be called "the Reformation." In England, if the formula "The Reformation" has any meaning at all, it means the whole period of ecclesiastical change which was spread over a time of about forty years. It was a time of constant change, of change backwards and forwards; its result was that, by the middle of the reign of Elizabeth, there was an established state of things wholly different from the established state of things which there had been in the middle of the reign of Henry VIII. But in the development of the ecclesiastical constitution of England, just as in the development of her political constitution, there was no moment when an old state of things was altogether swept away, and when a wholly new state of things was set up in its place. The ecclesiastical development was far swifter, far more violent, than the political development, but the two were essentially of the same kind. Both were brought about by the gradual working of causes and their effects. As the political development of England was something wholly unlike the violent change of the French Revolution, so the ecclesiastical development of England was wholly unlike the violent change of the Reformation in the Swiss Protestant cantons.

---

[1] The historian has been found—though the history is not generally accessible, and is not complete—in Mr. Brewer, who has traced the story of a large part of Henry's reign in the Prefaces to the Calendars of State Papers. The general character of Henry is well sketched by Hallam, who prophesies beforehand against some modern delusions.

[2] As, for instance, in the "Book of Articles," and the "Godly and Pious Institution of a Christian Man," put forth in 1536. Here is a certain amount of wavering as to the number of sacraments. That is about the whole advance in a Protestant direction; the six articles of 1541 enforce the Roman theology on pain of death.

The English Reformation begins from above.

Effects of the new learning.

The nation for popery without the pope.

Position of Cranmer and Gardiner.

The English Reformation then, including in that name the merely ecclesiastical changes of Henry as well as the more strictly religious changes of the next reign, was not in its beginning either a popular or a theological movement. In this it differs from the Reformation in many continental countries, and especially from the Reformation in the northern part of Britain. The Scottish Reformation began much later; but, when it began, its course was far swifter and fiercer. That is to say, it was essentially popular and essentially theological. The result was that, of all the nations which threw off the dominion of the Roman see, England, on the whole, made the least change, whilst Scotland undoubtedly made the most.[1] In England change began from above. But there is no reason to doubt that the acts with which the period of change began received the general approbation of the nation. It is plain that there was no general desire among Englishmen for strictly theological change. The old Lollard teaching, which had never quite died out, began to be of increased importance in the early days of Henry. There can be little doubt that this revival of strictly theological dissent was part of the same general movement which gave life to the new learning. But the men of the new learning, the English friends of Erasmus, Colet and More, with their patron Archbishop Warham, were not, strictly speaking, theological reformers. They aimed at general enlightenment and at the reform of practical abuses and superstitions; but they designed no change in dogma or ritual. Their more strictly intellectual movement merged in the wider theological movement; but in the beginning they were so far distinct that the author of *Utopia* showed himself in the strangely incongruous character of a persecutor. The small party of theological reform undoubtedly welcomed the changes of Henry, as being likely in the end to advance their own cause; but the mass of the nation was undoubtedly favorable to Henry's system of Popery without the Pope. For three hundred years the pope had been the standing grievance of Englishmen, and they were now rejoiced to get rid of him altogether. They were glad too to get rid of gross practical abuses, to reform the corruptions and oppressions of the ecclesiastical jurisdiction, to bring the clergy thoroughly under the power of the law. But they were attached to their old religious customs and ceremonies, and they had no love for new dogmas. In all this Henry and the mass of his people went heartily together. There were of course dissentients on both sides, men who wished for no change at all and men who wished for far greater changes. But there can be no doubt that the mass of the nation was satisfied with what their king gave them, ecclesiastical independence without theological change. On these points the great body of Henry's statesmen and prelates were of one mind. Cranmer and Gardiner accepted and carried out the same system. We can discern then, as at all other times, two parties with opposite tendencies; but they are merely opposite tendencies; there is no open breach. We are tempted to think that there was from the beginning an organized Catholic and an organized Protestant party.[2] But this is the idea of a later time. The mass of the nation and the great body of the leading men were substantially of one mind. There was a party favorable to more change and a party favorable to less, but both accepted the degree of change that was given them. A few zealots were embowelled for denying the supremacy; a few zealots were burned for denying transubstantiation. The great body of the nation, the great body of its representatives and its leaders, accepted transubstantiation and the supremacy together. Nor is there any need to charge either Cranmer or Gardiner with hypocrisy. No broad line was yet drawn, such as was drawn afterwards. Men obeyed and administered the ecclesiastical law, though they might wish it to be in some things different, just as men in all ages have obeyed and administered the temporal law, though they may have in some things wished it to be different. In truth Cranmer and Gardiner alike were trying to work a system which could not be permanently worked. They were trying to reconcile two things which could not be permanently reconciled. At last it became clear that Popery without the Pope would not work, and that men must take one side or the other. When it came to this, men in the position of Cranmer and Gardiner had to choose a side, and they chose opposite sides. Still, among all changes, under Henry, under Edward, under Mary, under Elizabeth, the mass of the nation conformed to every change. Again there is no need to charge them with hypocrisy. They obeyed the law, whether wholly approving it or not. A few on each side had consciences so susceptible that they deemed it their duty to defy the law. Among the mass of the nation some might be inclined one way and some another; but they felt no call to court martyrdom on either side.

Religious toleration unknown.

For it must be borne in mind throughout that as yet the idea of religious toleration, though it had presented itself to the mind of More as a matter of philosophical speculation, was unknown in Europe in any practical shape. Everywhere the dominant party, whichever it might be, forbade, and that in most cases under pain of death, the practice of any religion except that of the dominant party. Those who clave to the old religion forbade the practice of the new; and the professors of the new doctrines, the moment they had the power, forbade the practice of the old. So in England, through the whole period of Reformation, the existing system, whatever it was, was the only system that was allowed. Every other form of worship was forbidden under penalties, heavier or lighter. And there was always some form or degree of theological error which sent its professors to the flames. And, besides burnings for heresy, as heresy was understood at each successive stage, this period of English history is especially distinguished for the cloaking of what was really religious persecution under the guise of punishment for political offences. During the reign of Henry, every man who would now be deemed a conscientious Catholic was liable to die the death of a traitor. Every man who would now be deemed a conscientious Protestant was liable to die the death of a heretic. Under Edward and Elizabeth the standard of belief was changed, so changed that only a few extreme sectaries were now in danger of the flames. But the difference simply was that the line was drawn at a different point. Those who went beyond that point were burned by those who a few years before might have been burned themselves.

Administration of Wolsey.

For twenty years after his accession, Henry was famous, not only for strict orthodoxy of dogma, but for special devotion to the Roman see. He had received a learned education, and he believed himself to be a special master of theology. His writings in that character, as a defender of Roman doctrine against Luther, won him in 1521 the title of Defender of the Faith, which by a singular irony was conferred by Leo X. Through all this first period of his reign, the series of ecclesiastical statesmen still goes on. For fourteen years, from 1515 to 1529, ecclesiastical statesmanship was in truth at its highest pitch in the person of Thomas Wolsey, archbishop, cardinal, and chancellor. During the administration of this famous man, we are instinctively reminded of the joint rule of an earlier Henry and an earlier Thomas; but the fate of the two great chancellors was widely different. No English minister before Wolsey, and few after him, ever attained so great a

---

[1] On the whole, because, in some points of sacramental doctrine and ritual, the Lutheran Churches, especially in Sweden, have made less change than the Church of England has. But nowhere did the general ecclesiastical system go on with so little change as it did in England.

[2] These names are used, without any attempt at theological accuracy, as those which will most generally be understood, to point out the two opposite tendencies which at this stage were no more than tendencies.

Thomas Cromwell.

European position. He dreamed of the popedom, while his master dreamed of the empire. In his home administration Wolsey carried out the policy which had become usual since Edward IV., and summoned parliament as seldom as possible. On the other hand, his administration of justice won the highest general confidence, and his hand was far from heavy on the maintainers of the new religious doctrines. On the whole his position is rather European than English. He is the minister of Henry in his earlier character as warrior, conqueror, and arbiter of Europe. He is more like the great cardinals who ruled in other lands than anything to which we are used in England. The purely English work of Henry's reign was done by the hands of men of another kind. The æra of the lay statesmen now begins in the mightiest and most terrible of their number, Thomas Cromwell. From this time the highest offices are still occasionally held by churchmen, even as late as the middle of the seventeenth century. But the holding of office by churchmen now becomes exceptional; lay administration is the rule.

Henry's marriages.

There is no need to go through the endless tale of Henry's marriages, divorces, and beheadings of wives, except so far as they have a political or ecclesiastical bearing. The mere number of Henry's wives is unparalleled in our history, and has not many parallels in any history; and the king was, to say the least, unlucky, who, out of six wives, found himself obliged to divorce two and behead two others. But, even in these matters, the peculiar character of Henry's tyranny stands forth. Everything is done with some show of legal form. When he wishes to get rid of a wife, or to exchange one wife for another, the first is divorced or beheaded by some process which has at least the show of legal authority.

"Non nisi legitime vult nubere."

Effects of Katharine's divorce.

Title of Supreme Head.

Abolition of papal authority.

Of all Henry's doings in this way, the long story of the divorce of Katharine of Aragon is the first, and the most remarkable in its historical bearings. We may pass by details and points of controversy; but it is plain that the validity of the marriage of Henry and Katharine was on any showing doubtful, and that doubts had been from time to time raised on the point before the great controversy arose. It is further plain that it was most desirable for the kingdom to have an heir whose legitimacy could not be called in question. It is also plain that it is quite in the character of Henry, if he wished to get rid of Katharine and to marry Anne, to seize upon every shadow either of political expediency or of canonical subtlety which might help him to put a fair show on the course to which his own fancy led him. What he did he would do with some shadow of legal right, even though such shadow of legal right was to be had only by devising a new jurisprudence, by upsetting the relations of Church and State as they were then understood, by jeoparding the relations of his kingdoms with foreign powers, and by shedding any amount of innocent blood, provided always that it could be shed in legal form. It is enough for our purpose that Henry's wish to put Anne in the place of Katharine led to the endless disputes as to the validity of Katharine's marriage, and, as its first great result in England, to the fall of the great cardinal in 1529, followed by his death in the next year. Events now follow fast on one another. In 1531, by one of the meanest tricks that ever king played, the whole estate of the clergy was held to have fallen into a *præmunire* by admitting the legatine authority of Wolsey, which he had exercised with the king's full sanction. Their pardon was bought only by an enormous subsidy, and by acknowledging the king as Supreme Head on earth of the Church of England, a form of words now heard for the first time. In 1532, when all hope of a favorable sentence from Rome had passed by, Henry is believed to have privately married Anne. In 1533 the death of Archbishop Warham made room for the promotion of Thomas Cranmer to the see of Canterbury, a promotion which was still made by papal authority. The first act of the new primate was to hold a court which declared the marriage of Katharine null and the marriage of Anne lawful. Then came the great legislation of the year 1534, by which the papal authority was wholly abolished, while the Act of Submission on the part of the clergy subordinated all ecclesiastical legislation within the kingdom to the royal will. The succession to the crown was settled in favor of the issue of Anne, to the exclusion of the issue of Katharine, and the punishment of treason was denounced against all who refused to swear to the succession so ordained. The title of Supreme Head of the Church, already voted by the clergy, was now bestowed by parliament, and full ecclesiastical powers were annexed to it. These powers were allowed to be exercised by deputy, and in 1535 Cromwell was made vicegerent for the king in ecclesiastical matters, with precedence in the ecclesiastical convocation over the metropolitan himself. On the other hand, a strict statute was passed for the suppression of heresy. The scheme of Henry was now fully established; the religion of England was Popery without the Pope.

Indirect results of the change.

Deaths of More and Fisher.

More's doctrine of the royal succession.

It was only in an indirect way that such a change as this could give any encouragement to the professors of the reformed doctrines. It was only in a still more indirect way that it could tend to the establishment of religious toleration or the acknowledgment of liberty of conscience. Still, however indirectly, the first steps were now taken towards change in the received doctrines of the Church, and towards the toleration of dissent from those doctrines. So great a change could not fail to lead to further changes, and the next six years of Henry's reign were a time in which all the influences at work were in the direction of further change. It was the time of the administration of Cromwell, and of the highest influence of Cranmer. The new state of things was ushered in by the beheading of Sir Thomas More and of John Fisher, bishop of Rochester. No greater mockery of all the forms of justice was ever done in any age or in any land. But the execution of these two worthies calls for a special notice on account of the great constitutional point which it involves. They were called on to swear both to the succession to the crown, as settled on the issue of Anne, and also to the preamble of the act which declared the marriage of Katharine invalid. This latter oath involved a theological proposition of which their consciences disapproved; to the succession they were perfectly ready to swear. That is to say, More, the great thinker of his generation, utterly cast aside the whole figment of hereditary right. In his view the children of Henry and Anne would be illegitimate; but, in his view, it was within the power of parliament to settle the crown on the king's illegitimate children or on any persons whatsoever. To the succession therefore, which was all that was of any practical moment, he would swear; to a proposition which he held to be doctrinally false he would not swear. On these grounds Henry sent his wisest and greatest subject to the scaffold.

Cromwell's Reign of Terror.

Burning of Lambert.

Cromwell's reign of terror, as it has been well called, now sets in. It is specially remarkable for the constant use of acts of attainder, acts sometimes passed without giving the accused person the opportunity of making any defence. Not that in Henry's reign a defence went for anything, even when the regular forms of trial by a man's peers were observed. It was deemed for the king's honor that those whom the king accused should be convicted, and the Lords or the jury convicted accordingly. In more than one case, entries were found in Cromwell's papers, directing that such and such a person should be "tried and executed." Meanwhile new treasons and other crimes were invented. Martyrs were made on both sides; the supposed traitor and the supposed heretic were sometimes drawn to death on the same hurdle. Two of the martyrdoms of this period deserve special notice. In one case at least, but seemingly in one only, the penalties of heresy were held to attach to the denial of the king's supremacy. For this crime a friar, Forrest by name, was burned with special circumstances of brutal mockery. On the other side, the case of Lambert in 1538 well illustrates both the new jurisprudence and the peculiar position of some of the actors at the time. The men who were afterwards burned themselves were the foremost in burning others. Lambert was denounced by Taylor and Barnes, and condemned by Cranmer, for the denial of transubstantiation. He appealed to the king in his character of Head of the Church. Henry heard the cause in person, and, when his own arguments and those of Cranmer failed to convince the heretic, he was sentenced to the stake by the voice of Cromwell.[1]

---

[1] A modern writer thus comments on the death of Lambert:—"In a country which was governed by law, not by the special will of a

About the same time a general persecution took place of all who were guilty of having the blood of kings in their veins.

Beheading of Lady Salisbury.

Margaret countess of Salisbury was the daughter of George duke of Clarence, the mother of Reginald Pole. Pole was in theology the very opposite to Henry. As the system of Henry was Popery without the Pope, so Pole might be said to be inclined to the Pope without Popery. With a distinct leaning to the Reformers on some strictly theological points, he was a zealot for the papal supremacy. On this point, and on all the practical points which flowed from it, Pole was a vigorous disputant against his royal kinsman. But he was beyond the sea, safe from the grasp of Henry, Cromwell, or Cranmer. The head of his aged mother, sentenced to die by act of attainder, paid the penalty of his crime.

This last deed of blood was specially Henry's own. The attainder of the countess was indeed passed while Cromwell was still in power, but she was not put to death till after his fall. But the deaths of particular persons seem but a small matter beside the great revolution which Cromwell wrought over the whole face of the country by his great work of the suppression of the monasteries.

Suppression of monasteries.

This work indeed incidentally supplied him with not a few personal victims. That the power of the state was supreme, as over everything else, so over ecclesiastical foundations, no man in England could doubt. Monasteries had been suppressed on occasion from the earliest times. Special attention has been already called to the suppression under Henry V.; and during Henry's own reign Wolsey had suppressed a considerable number of small monasteries to supply endowments for his colleges at Ipswich and Oxford.

Earlier suppressions.

A general suppression of all the monasteries in the kingdom was clearly within the power of parliament, and strong reasons might have been brought for such a course. We must however remember that at this stage Protestant objections to the monastic life do not apply. Henry, while destroying the monasteries, enforced the obligation of the chief monastic vow. But it might well be argued that the number and wealth of these institutions were excessive, that they had ceased to fulfil their original purposes, that on any showing they needed a sweeping reform, and that possibly reform could not be carried out without suppression. For the measure itself then much might be said. The way in which it was carried out was characteristic of Henry VIII.

Distinct suppressions of greater and lesser monasteries.

Mere violence was inconsistent with his character; something of the form of law must be had. In 1536 the smaller monasteries were regularly suppressed by act of parliament, a course against which nothing can be said. But the greater monasteries were surrendered one by one into the king's hands by their actual occupants, an act of most doubtful legality. Where a surrender was refused, as at Reading, Colchester, and Glastonbury, the abbots were ordered, according to Cromwell's formula, to be "tried and executed" on such charges as were thought good.

Execution of abbots.

In these cases, by a strange construction of law, the monastery was held to fall by the attainder of its abbot. The suppression was justified by the reports of visitors, which in most cases charged the monks with crimes of various kinds. No one will believe that such a report was either wholly true or wholly false; but it is to be noted that monasteries which were reported to be wholly blameless, and for whose preservation the visitors themselves pleaded, were suppressed with the rest.

State of the monasteries.

It is to be further noted that, where abbots and priors surrendered easily, of whatever crimes they had been accused, their compliance was rewarded either with considerable pensions or with church preferment.[1] Of no monastery in England was a worse character given than of the priory of Christ Church at Canterbury, that which was attached to the metropolitan church. Yet, when that church was refounded as a secular chapter, Henry and Cranmer chose most of the canons and other officers of the church out of the body of men who had just before been branded with the blackest crimes. In the suppression under Henry V., nearly the whole of the confiscated revenues was applied to works of general usefulness, chiefly to the great educational foundations which were then rising. In the suppression under Henry VIII., by far the greater part of the vast revenues of the monastic houses was squandered or gambled away among Henry's courtiers.

Squandering of the monastic property.

Churches and churchyards were granted to private men, to be destroyed or desecrated at their pleasure. The tithe which the monasteries had taken to themselves, to the great wrong of the parish priests and their flocks, was now seized with their other property, and was granted away to lay rectors. Cranmer, who gave up several estates of his see to the king, did not scruple to receive grants of lands and tithe for the enrichment of his own family. Only a small portion of the monastic revenues was saved for public purposes of any kind. A little was spent on the defence of the coasts. Of a magnificent scheme for the foundation of new bishoprics, a small part only was carried out in the foundation of six slenderly endowed sees.

Henry's foundations.

Those cathedral churches which had been served by monks, and which therefore came into the king's hands with the other monasteries, were, with the exceptions of Bath and Coventry, refounded as churches of secular canons. Henry also gained the reputation of a benefactor in both universities. At Oxford his claim rests on several suppressions and refoundations of the college which had been begun by Wolsey, and on his charging the chapters of Oxford and Westminster with the maintenance of certain professors. At Cambridge the like reputation was gained by rolling several small colleges into one large one. The statutes of Henry's various foundations, drawn up in some cases by his own hand, breathe a spirit of piety and zeal worthy of Alfred or St. Lewis. Here again there is no need to suspect conscious hypocrisy. It only makes the character of Henry a more wonderful moral study. Besides the suppression of monasteries, a great deal of wealth, to be squandered in the like sort, was brought in by the destruction of shrines and by the seizure of the movable ornaments of many churches which were not suppressed. On the other hand, most of the inmates of the suppressed monasteries[2] received pensions, small in many cases, but enough for their maintenance; and these pensions seem to have been honestly paid. With the usual long life of annuitants, some of them still received their pensions in the reign of James I.

The foundations and refoundations just spoken of went on to the very end of Henry's reign. An Act of 1545 placed the secular foundations, the colleges and hospitals, at his mercy; and he destroyed, refounded, or left untouched, according to his pleasure. But the two great suppressions, the suppression of the greater and of the lesser monasteries, were all done under the rule of Cromwell, and in his time came their immediate political results.

It is not easy to say what was the general feeling of the nation towards the suppressed monasteries. It doubtless differed widely in different places, according to the character of particular houses. It is certain that in 1536 the whole north of England rose in revolt on occasion of the suppression of the lesser monasteries.

Pilgrimage of Grace.

This revolt, called the Pilgrimage of Grace, was distinctly a religious movement; but it was a political movement as well. We seem to have gone back to the days of Edward the Confessor, when we find the northern insurgents demanding that no man north of Trent should be compelled to appear in the ordinary course of justice anywhere but at York. They demanded also the holding of a parliament at York, which Henry promised, but neglected to summon. The revolt began again, and it was suppressed with a large amount of hanging, beheading, and burning of the abbots, lay lords, ladies, and others who were concerned. A Lord President and Council of the North were now appointed to keep that dangerous region in order.

But after all, in Henry's reign it is the marriages, the divorces, and the beheadings of his several queens which form, if not the causes, at least the occasions, of the greatest changes. Henry's dissatisfaction with one marriage had led to the fall of Wolsey and the rise of Cromwell; his dissatisfaction with another marriage led to the fall of Cromwell

---

despot, the supreme magistrate was neither able, nor desired, so long as a law remained unrepealed by parliament, to suspend the action of it." This singular argument forgets, among several other things, the royal prerogative of mercy.

[1] Thus the last abbot of Peterborough became the first bishop, and the prior of St. Andrews at Northampton, who, in the act of surrender, had drawn a dark picture of the doings of himself and his monks, became the first dean.

[2] All, perhaps, except the nuns of the lesser monasteries, who were sent away with only a gown apiece.

Beheading of Anne Boleyn.

Jane Seymour.

Marriage of Anne of Cleves; its political results.

Fall and execution of Cromwell.

himself. England and Europe had been turned upside down in order that Henry might marry Anne Boleyn. Three years after her marriage, she was got rid of by the twofold process of a divorce pronounced by Cranmer which declared the nullity of her marriage, and of a conviction for adultery by the House of Lords which implied its validity. Anne was beheaded, and the next morning Henry, acting, as we have been told, from the severest principles of public duty, married her maid Jane Seymour. It was now made treasonable to assert the validity of Anne's marriage, as before it had been treasonable to deny it. Anne's daughter Elizabeth was declared illegitimate, as Katharine's daughter Mary had been declared illegitimate, and the crown was settled on the issue of Jane only. The new queen, by unusual good luck, died, neither divorced nor beheaded, at the birth of her only child, Henry's only legitimate son, the future Edward VI. Except as regards the succession of the crown, all this is little more than an episode. Henry's fourth marriage was of greater political importance. Katharine, Anne, and Jane had been at least his own choice. Anne of Cleves was chosen for him by his vicegerent. Her marriage was part of a political scheme for a union between Henry and the Protestant princes of Germany against the emperor. Cromwell, it is plain, went further than the king approved in advances towards these heretical allies, and the queen whom he found for Henry among them found no favor in Henry's eyes. Cromwell had in fact chosen his time badly for any advances in a Protestant direction. While his negotiations with the German princes were going on, the statute of six articles was passed by the parliament of 1539, which enforced the old belief under the deadliest penalties. The marriage took place at the very beginning of 1540. In the course of the year Cromwell was created Earl of Essex, arrested, attainted without a hearing, and beheaded. In the interval between his attainder and his execution, the marriage which he had brought about was annulled by convocation, and on the day of his beheading Henry married his fifth wife, Katharine Howard.

Cromwell's dealings with parliaments.

Practice of prorogation.

Effects of Henry's despotism.

The administration of Cromwell, remarkable as it is in other ways, derives its greatest constitutional importance from the new relations between crown and parliament which now begin. Wolsey, after the example of Edward IV. and Henry VII., had shrunk from meeting the assembly of the nation. Under his rule parliaments were summoned as seldom as might be. Cromwell, on the other hand, never feared to face parliament. From the time of his accession to power till the end of Henry's reign, parliaments were constantly held. And from this time, a practice which had been already followed sometimes rose into special importance. The king's powers of prorogation and dissolution of parliament now come into notice. The early parliaments met; they did the business for which they were summoned, and then they went home again. The prolongation of the life of the assembly beyond the time of its session was not thought of. Each meeting implied a new election of the House of Commons. But it was gradually found that a parliament which suited the king's purposes might be kept in being by prorogations from one session to another. This practice began to be used under Henry VI. and Edward IV., in which last reign the practice became usual; under Henry VIII. it became systematic. Some of his parliaments lived in this way for four successive years. Cromwell was thoroughly master of the art of packing and managing parliaments, an art to which the succeeding reigns added the practice of summoning members from a crowd of petty places, with the express object of securing subservient returns. The parliaments of Henry's time passed, though not always without opposition, whatever the king wanted, even to the act which gave the king's proclamation, with certain exceptions, the force of a statute. But in the fact that parliaments for a while became so slavish lay the hope of the final revival of freedom. It was under the despotism of Henry exactly as it had been under the despotism of the Conqueror. There was no need to abolish institutions which could so easily be turned to work the despot's will. There was no need seriously to encroach upon their formal powers. The institutions and their powers thus remained, to be again quickened into full life in the seventeenth century, as they had before been quickened in the thirteenth century. Had Henry met with a stronger parliamentary opposition, our liberties might have passed away, like the liberties of the lands which went to make up the monarchies of France and Spain. Parliaments went on, because parliaments voted whatever the king wished. Juries went on, because they convicted whomever the king wished. But, because they were allowed to go on, a time came when parliaments learned to pass measures which kings did not wish to have passed, and when juries learned to acquit men whom kings wished to destroy. In this way, as William the Conqueror in one age, so Thomas Cromwell in another, may be looked on as the indirect preserver of English freedom.

Dealings with Scotland.

Scheme of union.

After the fall of Cromwell the reign of Henry loses much of its interest; or at least the interest is, as at the beginning of his reign, again transferred to the wars with France and Scotland. But these wars, with their momentary successes, are of little importance, except that in the course of the Scottish war we see the beginning of the train of events which sixty years later united the English and Scottish crowns. James V. of Scotland, it must be remembered, was Henry's nephew, the son of his sister Margaret. According to genealogical notions, he was next in succession to the crown after Henry's own children. The prospect of this contingent succession was dangled by Henry before the eyes of James. And when James died, leaving an infant daughter, the famous Queen Mary, Henry's schemes now took the form of a marriage between her and his son Edward. This was exactly the same scheme which had been proposed by Edward I. when Scotland had an earlier child queen. In neither case did the scheme bear immediate fruit. The marriage of Edward and Mary formed one of the terms of a momentary peace between England and Scotland in 1543. But the war began again, and was carried on, in connection with the reforming party in Scotland, both during this reign and during the early years of the next, with the avowed object of bringing about the marriage. It is needless to say that the marriage was never carried out. But Mary came to be, on other grounds, a claimant of the crown of England, and her son came to possess it.

Later years of Henry.

Katharine Howard.

Katharine Parr.

During these later years of Henry, no commanding figure stands out like those of Wolsey and Cromwell. Henry himself, towards the end of his reign, lost much of his energy. Martyrdoms on both sides still went on, though, as compared with the slaughter of later times, they were rare on both sides. There is yet no open change; but the gap between the two parties gets wider and wider. Katharine Howard, married in 1540, was beheaded early in 1542. In the next year Henry married his last wife, a third Katharine, commonly called Katharine Parr, but who was then the widow of Neville Lord Latimer. Her leaning was to the new doctrines, and at one time she was in danger on their account. On the whole, the tendency was now in favor of change. Things seemed to sway backwards and forwards between Bishop Gardiner and the duke of Norfolk on one side and Cranmer and Edward earl of Hertford, a brother of Queen Jane Seymour, on the other side. At the moment of Henry's death the reforming party had the greater influence. The last who were sentenced to die in his time were Norfolk himself and his son the famous earl of Surrey. The son perished; the father was saved by the king's death. But though the reforming party had politically the upper hand, no step was taken as long as Henry lived in the direction of strictly religious reformation.

The succession.

Crown entailed on Henry's children.

The most important question during these later years was the settlement of the succession. By a statute passed in 1544, the crown was to pass to Henry's three children in order, Edward, Mary, and Elizabeth. Both of the king's daughters had been declared illegitimate; but now, without any reversal of their illegitimacy, they were placed in the succession to the crown. On no theory could Mary and Elizabeth both be legitimate; the law had declared that neither of them was. The point is of importance, because in truth neither Mary nor Elizabeth reigned by any right of birth, but by a purely parliamentary title. But the statute went on further to bestow on Henry a power which never was bestowed on any other king before or after.

Henry's will.

In default of the issue of his own children, the crown was to pass to such persons as he might himself appoint by his last will, signed with his own hand. By his last will he exercised this power by leaving the crown in remainder to the issue of his younger sister, Mary the French queen, who, after the death of Lewis XII., had married Charles Brandon, duke of Suffolk. He thus passed by the queen of Scots and the other issue of his elder sister Margaret. The provisions of this will become of great importance at a later time; and it shows on what small accidents great questions may depend, that it is matter of controversy whether the will was signed by the king's own hand, according to the statute, or whether it was merely signed with a stamp.

Incorporation of Wales.

Ireland a kingdom.

In this memorable reign then, though no strictly religious reformation was wrought, yet a step was taken which made religious reformation inevitable. One marked feature of the fully developed English character was now added. England was from this time, with a momentary interruption, the enemy of the Roman see. But the reign of Henry helped in another way towards the welding together of the whole isle of Britain. Wales was now fully incorporated with the kingdom of England. It was brought wholly under English law and was fully represented in the English parliament. Ireland too was brought into more complete submission than it had ever been before, and in 1542 Henry exchanged his title of Lord of Ireland for that of King, or, as an Irish Act words it, "King and Emperor of the realm of England and of the land of Ireland." Ireland was a dependent kingdom; still from this time it was a kingdom attached to the crown of England, and by making it such a distinct step was taken towards the union of the British islands.

Reigns of Henry's children.

Beginning of strictly religious changes.

Reign of Elizabeth.

On the reign of Henry followed the reigns of his three children in succession, according to the order laid down in the statute of 1544. The marked historical feature of these reigns is that they are the time of strictly religious reformation. It was found that the middle system of Henry could not last, that the English Church and nation must throw in its lot with one side or the other in the great controversy of the age. Under Edward the religious reformation was wrought. Under Mary, first the work of Edward, and then the work of Henry, was undone, and the authority of the Roman see was again admitted. Under Elizabeth the work both of Henry and of Edward was done again. Her reign, four times the length of the two reigns of her brother and sister, is the time when the religious position of England took its final form. The national Church was organized in its essential features as it still remains. And, before the end of her reign, the two parties, those who thought change had gone too far and those who thought that it had not gone far enough, had ceased to be mere parties within the same body. They had become distinct bodies of separatists on either side of the national Church. The reign of Elizabeth saw the beginnings of the Roman Catholic body on the one side and of the Protestant dissenters on the other. As yet both dissentient bodies existed only as objects of persecution. A main feature of the later religious history of England has been the steps by which, first the Protestant dissenters, and then the Roman Catholics, have been admitted to full equality with the members of the national Church.

Relations with France and Spain. Beginning of religious and political parties.

The political history of these reigns, domestic and foreign, is of high importance, but it depends in a large measure on the religious history. It was mainly owing to religious causes that the enmity towards France, so strong in earlier times, so strong again in later times, was during this period exchanged for a temporary enmity towards Spain. And during the reign of Elizabeth we see the beginnings of that alliance between certain religious parties and certain political parties which forms the leading feature of the history of the seventeenth century. In truth, it was during this time that organized parties, either religious or political, had their beginning. In a certain sense there have been Whigs and Tories from the beginning. We can see the existence of different political opinions, of different theories as to the relation of the crown and people, in days before the Norman Conquest: and in every civil war, in the wars of the thirteenth century above all, distinct political parties stand forth and meet one another in arms. But it can hardly be said that such parties lasted beyond the immediate occasion, or that the party of one age was connected by direct succession with the party of an earlier age. But from the days of Elizabeth the political and religious parties of later times can be distinctly traced. From her time they have an unbroken succession; from her time they have the special characteristic of being parliamentary parties.

Reign of Edward VI.

Somerset.

Northumberland.

Edward's will.

Momentary reign of Jane.

Accession of Mary.

The six years' reign of the young son of Henry VIII. might almost be called a revolutionary period throughout. Its beginning marks a stage in the history of kingship in England. Edward VI. succeeding by the express terms of an act of parliament, was the first king at whose accession the last traces of the ancient popular election were dispensed with. He was a minor, and his authority was struggled for by a knot of ambitious men, all of whom had risen into importance during the late reign. The king's uncle, Edward earl of Hertford, named by Henry as one member of a council of regency, contrived to make himself duke of Somerset and sole protector. Finding a rival in his younger brother Thomas, he, Cromwell-fashion, procured his attainder without a hearing. In 1549 he himself fell before the arts of John Dudley, earl of Warwick and duke of Northumberland, the son of the notorious agent of Henry VII., the father of the notorious favorite of Elizabeth. Somerset was partly restored to favor in 1550; but in 1551 came his trial and execution, strange to say on a charge of felony, though a political felony, and not of treason. The remaining two years of the reign of Edward are the reign of Northumberland. His last act was to persuade the young king to do without parliamentary authority what his father had done by parliamentary authority, and to settle the succession to the crown by will. By this illegal instrument he disinherited both his sisters, and named Jane Grey as his successor. As a granddaughter of the French queen Mary, Jane was in the line named by Henry in case of the failure of his own children; but her immediate promotion was due to her being the wife of a son of Northumberland. Jane, proclaimed by the council, was rejected by the nation, and Mary, whose parliamentary title was undoubted, was raised to the throne by a popular movement. Northumberland of course paid his forfeit with his head; but the execution of Jane herself, not at the time, but after a later revolt in which she had no share, was an act of needless harshness.

Relations with France and Scotland.

Religious changes.

The English Prayer-Book.

The Articles.

England under Edward altogether fell from the great European position which she had held under Henry. The chief foreign events of the time are the war with Scotland, the useless and barbarous havoc done by the Protector, and the peace both with Scotland and with France by which Boulogne was restored. But the real character of the reign is marked by its ecclesiastical changes, changes which are largely mixed up with a social revolution which was now going on. The strictly religious changes began with the promulgation of a Book of Homilies in the first year of Edward. It marks the state of things at the time that one of these homilies, which are still to this day set forth by authority to be read in churches, was the work of Edmund Bonner. The homilies were followed in 1548 by a form for the administration of the communion in English, and in 1549 by the publication of the complete English Prayer-Book and an act allowing the marriage of the clergy. This first Prayer-Book of Edward marks the first stage of the religious Reformation. It is a purely English stage; the influence of Rome has been cast aside; the influence of continental Protestantism has not yet come in. But some of the foreign Reformers were before long invited to England, and their presence soon made itself felt. In 1552 the Prayer-Book was revised in a more distinctly Protestant direction. Before this, in 1551, a Book of Articles of Religion, forty-two in number, were put forth. The Prayer-Book and the Book of Articles represent two sides of the Reformed English Church. The Prayer-Book, chiefly formed out of ancient service-books, remained, even after the changes of 1552, a link with the older state of things. The Articles, even after some changes in the time of Elizabeth, form a manifesto on behalf of the new state of things and a link with the Reformed Churches in other lands. The Prayer-Book and the Articles have ever since been severally the watchwords of two parties within the Church. It is not too much to say that there has ever since been a party which has loved the Prayer-Book and endured the Articles, and a party which has loved the Articles and endured the Prayer-Book. By the end of Edward's reign, the English Church stood by itself, retaining the old fabric of ecclesiastical government, with a service-book chiefly drawn from ancient sources, but with a system of doctrine breathing the spirit of the more thorough-going Reformers of the continent. Had Edward lived, further changes would probably have followed. As it was, the reaction under Mary opened the way for the final settlement under Elizabeth.

The bishops under Edward.

Burnings.

The position of the prelates who clave to the old system during Edward's reign should be carefully noticed. They neither resigned their sees nor refused obedience to the new law. It does not appear that any bishop declined the use of the first Prayer-Book. Gardiner and Bonner were imprisoned and deprived of their sees on various pretences, as were several bishops later in the reign for refusal to comply with various orders, some of which certainly had no parliamentary authority. A large body of the prelates and others were dissatisfied with the changes that were made; but there was not only no separation, there was no disobedience to the law. More than one bishop who appears as a persecutor in Mary's reign had gone considerable lengths under Edward. And, as there was little non-conformity, there was little persecution in this reign. The Lady Mary, protected by the emperor, continued the private use of the old service. The heresy statutes were abolished; yet Cranmer found means, under cover of the common law, to send to the flames one Englishwoman and one stranger who ventured to go further in the way of novelty than himself.

Suppression of colleges.

Church plunder of the courtiers.

The grammar schools.

But, besides ecclesiastical reform, this reign was beyond all other times the time of ecclesiastical spoliation. It was even more distinctly so than the reign of Henry. The suppression of the monasteries, the destruction of the shrines, were at least acts of policy. But in Edward's reign the possessions of the Church were simply thrown to be scrambled for by the courtiers. One of the first acts of the reign, the suppression of those colleges, chantries, and the like which Henry had spared, was at least done in legal form. But, during the rest of Edward's time, Somerset, Northumberland, and the rest simply seized on whatever they thought good. The nearest approach to legal form in such cases was the show of an exchange by which a valuable estate was exchanged for a paltry rectory. And, as far as the courtiers were concerned, everything went to enrich private men. The one act in which the public good was at all thought of came from the king himself. Edward, of his own act, applied a part of the revenues of the suppressed colleges and chantries to the foundation of that great system of grammar schools which still bear his name.

Legislation of Edward.

The western rising.

The legislation of this reign presents some good points. Many of the newly created treasons of the late reign were abolished, and two witnesses were made necessary on trials for that crime. The act which gave the king's proclamation the force of a statute was repealed. On the other hand, there was the severe Statute of Vagabonds, which went beyond even the old Statute of Laborers. This reign too was marked, like those of Richard II. and Henry VI., by popular revolts. One grievance was the throwing land out of tillage and taking it into pasture. This was laid specially to the charge of the grantees of the monastic lands, who were found to be in most respects harder landlords than the monks had been. Risings of the lower people took place, both in the eastern counties where the Reformed doctrines were popular, and in the West where the religious changes were disliked. The western insurrection broke out on the first use of the new Prayer-Book. The insurgents demanded the continuance of the old service and a partial restoration of the monasteries. This last demand perhaps points to the state of feeling into which the various currents for and against the monastic orders had at last settled down. The popular belief clearly was that, in the former state of things, there had been more monasteries than enough, but that the country had not gained by sweeping them away altogether. It was eminently characteristic of the time that this revolt of Englishmen was put down by the help of German and Italian mercenaries.

Reign of Mary.

The first queen regnant.

Effect of Mary's reign.

The middle system impracticable.

Personal position of Mary.

The reign of Edward was followed by another reign, yet shorter than his own, but not less memorable. The nine days' wonder of Jane's reign was followed by the five years of Mary. It is singular, that, though the crown of England had so often passed to claimants whose descent was wholly in the female line, yet England had never before seen a crowned queen. The empress Matilda was never crowned, and she bore no higher title than Lady. The novelty gave rise to some cavil, and it was found needful at a later stage of Mary's reign for Parliament to declare that a queen of England possessed all the rights and powers of a king. This first female reign was the time which finally settled the religious position of England. There can be little doubt that throughout Edward's reign the mass of the people were still attached to the system of Henry, that they did not wish for the religious changes of Edward's reign, but that they had not the slightest wish to bring back the spiritual dominion of Rome. They were for the mass, but not for the pope. The reign of Mary taught them that the middle system would not work, that one side or the other must be taken, that the mass could not be had without the pope. Furthermore, men learned to connect both mass and pope with a political alliance which they hated, and with a persecution different both in kind and in degree from anything which England had before seen. As for Mary herself, it is as impossible to deny her many personal virtues as it is to deny her share in a persecution which, whoever may have been its advisers, she at least did nothing to stop. But her personal position had much to do with the course of events, religious and political. She was the only person in the realm who was bound, not only to the ancient faith and ritual, but also to the supremacy of Rome. The supremacy of Rome was inseparably connected with the validity of her mother's marriage and the legitimacy of her own birth. As it was, she was simply queen by act of parliament. She naturally wished to be queen as the legitimate daughter of her father. And, if she was bound to Rome, she was no less bound to Spain. The emperor had been her firm and her only friend, whose influence had secured her life and her freedom of worship. Another sovereign might have restored the ancient worship with the assent of the greater part of the nation; but, with Mary as queen, the restoration of the ancient worship meant spiritual submission to Rome and political subserviency to Spain; and in this the nation was not prepared to follow her.

Stephen Gardiner.

The old worship restored.

The queen's marriage.

The ecclesiastical changes of Mary's reign began at the beginning. She caused the old services to be used on several occasions before their restoration by law, and, by virtue of the ecclesiastical supremacy which she inherited from Henry and Edward, she caused the bishops who had been deprived during the late reign to be restored to their sees. Foremost among these was Stephen Gardiner, bishop of Winchester, who became the queen's chancellor and chief adviser. There seems reason to think that his share in the persecution has been greatly exaggerated. It is certain that his conduct in secular matters was that of a patriotic, and even a constitutional, statesman. A parliament shortly met, which declared the validity of the marriage of Henry and Katharine and the legitimacy of their daughter's birth. The ancient worship was restored, and some special enactments of the two late reigns were repealed; but the ecclesiastical power of the crown was in no way touched, and nothing was said of the restoration of the papal authority. The middle system of Henry was thus restored, but only for a moment. The next great question was that of the queen's marriage. Gardiner and her English advisers favored her marriage with Edward Courtenay, earl of Devonshire, whose parents had been among the victims of Henry, and who was descended from one of the daughters of Edward IV. But Mary's fixed purpose from the beginning was to marry her Spanish kinsman Philip. Sir Thomas Wyatt and the duke of Suffolk, father of the imprisoned Jane, took arms to hinder the marriage; but their enterprise led only to their deaths and to those of Jane and her husband. More interesting in the history of our institutions is the fact, almost unparalleled in these times, that one of the accused persons, Sir Nicholas Throckmorton, was acquitted by the jury that tried him. His life was saved; but he remained for a while in prison, and the jurors, according to a custom which was not left off till more than a century later, were fined. In the next year, 1554, the queen's marriage with Philip, already king of Naples, took place. This first husband of a reigning queen was made king of England and of Mary's other kingdoms for her life. In the next year, by the abdication of Charles V., Philip succeeded to the Spanish, Italian, and Burgundian possessions of his father. The difference between the position of Philip and that of Charles is to be noticed. Charles V. was emperor; alliance with an emperor was simply the continuation of a policy older than the Norman Conquest. But Philip was not emperor; his policy was not imperial but Spanish. The marriage made England for a moment, in a European point of view, a mere tool of Spain. At home it no doubt strengthened the movement for complete reconciliation with Rome, and for the persecution of those who, after being dominant in the last reign, were deemed heretics in this.

Reconciliation with Rome.

The persecution.

Burning of Cranmer.

In the year of Mary's marriage Reginald Pole, now cardinal, came back to England as legate, and the Lords and Commons of England knelt to receive his absolution for the national schism. He confirmed by papal authority various acts done during the time of the separation, and it does not appear that the ordinations of bishops and priests which had been made during Edward's reign were ever called in question. And, to quiet a doubt which made many minds uneasy, the actual owners of church lands were confirmed in their possession. An act of parliament followed, by which the papal authority was restored as it had stood before the changes of Henry. Gardiner and Bonner, the strenuous opponents of the pope in Henry's days, and Thirlby, who had gone a long way with the changes under Edward, were now bishops of a church in full communion with Rome. That is doubtless, they had seen that, at all events with a Spanish king consort, the middle system could not be kept, and that those who clave to the mass must accept the pope with it. From this time we have two distinct religious parties, the party of the pope and the party of the Reformation. These last were now deemed heretics, and the old heresy laws were revived for their destruction. In 1555 the persecution began, and it lasted till the end of Mary's reign. It differed from the two-edged persecution of Henry's reign in two points. Henry's victims of either faith were comparatively few, and they were mostly persons of some importance. In the three years of the persecution of Mary, more victims were burned than in all the reigns before and after put together. And it was a persecution which, as far as the laity were concerned, fell mainly on victims whom Henry would have scorned to destroy, on the poor, the halt, and the blind. No layman of any distinction suffered; but on the Reformed clergy the hand of the destroyer fell heavily. Five bishops perished. Of these were Ridley and Latimer—true martyrs on one side, as More and Fisher on the other—Hooper, the professor of a straiter sect of Protestantism, and the less famous Farrar of St. David's. The primate followed the next year. He had been lawfully condemned to death for his treason in the usurpation of Jane; and his execution under that sentence, though it would have been a harsh measure, would have been a small matter compared with many an execution of the days of Henry. He was spared, probably in mercy; but he was spared only to bring on Mary and her government the deeper infamy of burning one who had recanted his heresies. The persecution was throughout more the work of the council—by whom Bonner was blamed for slackness—than of the bishops. No one was more zealous for slaughter than William Paulet, marquess of Winchester, one of the new men who conformed to every change, and who died in honor under Elizabeth. After the burning of Cranmer, and not till then, though the see had been for some while vacant by his deprivation, Pole succeeded to the see of Canterbury, the last archbishop in communion with Rome.

War with France.

Loss of Calais.

The last days of Mary showed the impolicy of the Spanish match. Strange to say, one of the first acts of Philip, so pre-eminently the Catholic king, was a war with the pope, Paul IV., in his temporal character. Henry of France broke his truce with Spain, and encouraged English traitors to attempt the betrayal of Calais, and to make an actual landing in England. Mary declared war in 1557, and English troops shared in the victory of St. Quintin. But at the beginning of the next year, the last of Mary's reign, the French took Calais, and England ceased to be a continental power. She has won back that character in later times by the momentary possession of Dunkirk and the more lasting possession of Gibraltar; but the last relic of the conquests of Edward III. now passed away, as the last relics of the inheritance of Eleanor had passed away 105 years before. For a few months Mary bore up against sickness and neglect, against sorrow and national discontent. On November 17, 1558, she died, and the cardinal followed her, having been for a few hours the subject of Elizabeth.

Reign of Elizabeth.

Position of the national Church.

Beginnings of the Puritan party.

This last fact brings us to the great reign which ends the period with which we are now dealing. Under Elizabeth that which was wanting to complete the character of England and of Englishmen was added. The religious character of the nation was now fixed; and its religious character had no small share in fixing its political position at home and abroad. The national Church retained so much of the middle system of Henry as to hold in some sort a middle place between Rome and the Protestant Churches of the continent. But this middle position at no time extended to more than strictly religious points of doctrine, discipline, and ceremony. As a nation, as a power, England has been essentially Protestant from the time of Elizabeth. But the fact of the middle position of the English Church led to the formation of religious bodies at home which parted off from it in opposite directions. And from Elizabeth's day onwards the party of further religious reform has also been the party of political freedom. The Puritan party, it must be remembered, had no more notion of toleration than any other party of those days. Its object, like that of every other party, was not the mere toleration, but the exclusive establishment, of its own system. But, on the one hand, every change, every debate, helped to bring about religious toleration in the end. And, as the Puritan movement was largely a movement against arbitrary authority, it was necessarily a movement in favor of freedom. But in England a movement in favor of freedom did not mean the establishment of anything new, but the restoration of what was old. It meant the carrying out of existing laws which Tudor despotism had trampled under foot. In any new legislation that might be needed, it meant the falling back on the old constitutional principles which had been always acknowledged, if not always carried out in practice, from Edward I. to Henry VI. Politically the struggle of the seventeenth century, which had its root in the controversies of the sixteenth, was the repetition of the struggle of the thirteenth. Even in the religious element in both cases there is a likeness. Earl Simon and his friends did not swerve from the received orthodoxy of their day; for the time for strictly religious controversy had not yet come. But they were none the less the Puritans of their own day. A revived spirit of independence marks the parliaments of Elizabeth, and marks them in proportion as the Puritan element grows stronger. Elizabeth loved arbitrary power as well as any sovereign that ever reigned; but she knew that one condition of holding any power was to know how to yield, and, when she yielded, she yielded gracefully.

Ecclesiastical changes.

The prayer-book.

Whatever may have been Elizabeth's personal religious convictions, there can be little doubt that the middle system of Henry was that to which she was herself inclined. But she found that its complete restoration was impossible. If it had ever been possible, it was impossible now, after the reconciliation with Rome and the persecution. Her reform was therefore obliged to be, not a return to the system of her father, but a return, with some modifications to the system of her brother. The second service-book of his reign was taken as the standard;

Opposition of the bishops.

but some changes were made, the first of several successive changes, all of which have been in the direction of a return to the first book. It was Elizabeth's policy to make her new system as little offensive as might be to those who still preferred the old state of things. She refused the title of Head of the Church which was offered to her by parliament, and which had been borne by Henry, by Edward, and by Mary up to the reconciliation with Rome. She caused some passages in the prayer-book, which were specially offensive to the papal party, to be left out. The forty-two articles of Edward were not enforced in the earlier years of her reign, and when they were enforced, they were cut down to thirty-nine. One favorite doctrine of the Reformers, the lawfulness of marriage in the clergy, Elizabeth could never be brought to sanction by any legal enactment. The practice was simply winked at during the whole of her reign, and was not legalized till the reign of her successor. On the other hand, the anti-papal legislation of Henry was restored in its substance; but the refusal of the oaths, which under Henry had carried with it the pains of treason, in Elizabeth's first legislation carried with it only loss of office. But we are met at the very beginning with the fact that the changes under Elizabeth, less violent in every way than the changes of Henry and Edward, met with a much more decided opposition from the bishops than the changes of Edward and Henry had met with. Prelates who had gone all lengths with Henry, who had gone a considerable way with Edward, refused the oath of supremacy under Elizabeth. One only of the existing bishops conformed, Kitchen of Llandaff, who had kept his see through all changes. The reason doubtless was that the rest had seen the hopelessness of the middle system, that they had chosen their side with the papacy, and that they could not either in conscience or in decency change again. The mass of the clergy conformed; so did the great body of the laity, including some of the lords who had voted in parliament against all Elizabeth's changes. In the early years of Elizabeth, though there were two discontented parties in opposite directions, and though some still practised the old rites in secret, there was no open separation either way. Elizabeth always professed that she did not force the conscience of any one, but that the English service was established by law, and that the law must be obeyed. And there doubtless were still many who were ready to conform without approving, just as they were ready to obey the law on any other subject, even though they might wish the law to be altered. It has even been said that, when Pope Pius IV. made overtures to the queen, he offered to admit the use of the English service-book on condition of his supremacy being acknowledged.[1] Such a compromise would have put the English Church in the same position as the bodies known in the East as United Greeks and United Armenians, who admit the papal authority, but keep their own national usages. But the pontiffs before and after Pius, Paul IV. and Pius V., dealt with Elizabeth in another fashion. In their eyes, and in the eyes of all the extreme supporters of papal claims, she was not only schismatic and heretic, but an usurper of the English crown.

The succession: position of Elizabeth and Mary.

Claims of the house of Suffolk.

Accession of James of Scotland.

On this last point much of the history of this reign turns, both domestic and foreign. According to English law, nothing could be better than Elizabeth's parliamentary title, a title quite independent of the canonical legitimacy of her birth. But, according to the papal theory, she was illegitimate, and, according to the hereditary theory, her illegitimacy excluded her from the crown. On this showing, the lawful queen was Mary of Scotland, who, at the beginning of Elizabeth's reign, was the wife of the dauphin, soon afterwards Francis II. king of France. Francis and Mary took the titles of king and queen of England and Ireland; and Mary, whether at the court of France, on the throne of Scotland, or in her prison in England, was the centre of all the hopes and all the conspiracies of the Roman party. This is not the place to go through her story, closely connected as it is throughout with English history. As regards the succession, it is clear that, by the will of Henry VIII., the claim of the house of Suffolk was undoubted. But it was a kind of claim which needed a claimant of position and ability, like Richard of York in former times, to assert it. The house of Suffolk, on the other hand, was under a cloud, through a series of low or doubtful marriages. Their claim therefore passed out of notice. The queen obstinately refused to name any successor, or to allow any successor to be named; and all claims might be looked on as set aside by an act which made it treasonable to maintain any one to be the lawful successor except the queen's own issue. In this state of things, men's minds naturally turned to the Scottish line, which had at least hereditary descent in its favor. After the death of Mary the religious objection no longer applied, and James, her Protestant son, succeeded on Elizabeth's death, without the slightest opposition from any party. The house of Stuart however came in without any shadow of parliamentary title, and directly in the teeth of the parliamentary title of the house of Suffolk, if the will of Henry VIII. is to be looked on as valid and unrepealed.

Rising in the North.

The Roman Catholics and Puritans separate.

The High Commission.

Persecutions.

Execution of Mary Stuart.

The quiet of the first eleven years of Elizabeth's reign was broken in 1569 by a rising in the North in favor of the old religion. This was not a mere popular movement, like the western and eastern revolts of Edward's reign. Its leaders were the greatest nobles of northern England, the earls of Northumberland and Westmoreland. It was, in short, the Pilgrimage of Grace over again. The insurrection was put down with a good deal of bloodshed, but not till mass had been again sung in Durham Abbey. In the next year, 1570, the bull of excommunication and deposition pronounced by Pius V. changed all Elizabeth's relations at home and abroad. From this time the English Roman Catholics, from a party dissatisfied with change, become a distinct and a persecuted religious body. In the next year the Puritan movement for further change in the church took a more definite shape in the motions of Strickland in the House of Commons. About the same time the first separate Puritan congregations began to be formed. From this time the queen and her ecclesiastical system had to struggle with enemies on both sides, and to deal out persecution in different measures against both. A terrible engine for this purpose was the special creation of the reign of Elizabeth, the Court of High Commission. The queen, as Supreme Governor of the Church, appointed commissioners, clerical and lay, to exercise the somewhat undefined powers of her office. Alongside of the Star-Chamber a kindred power arose, to bring men's souls and bodies into submission. And meanwhile a few men who ventured on specially daring speculations, and whose tenets were condemned alike by Roman, Anglican, and Puritan orthodoxy, were still sent to the flames. The Roman martyrs were many; but in their case religious and political disputes were hopelessly mixed up. Conspirators against the queen's life or crown could not be allowed to escape on any pretence of religious duty. On the other hand, acts of simple religious worship were made criminal, though liable to the fate of treason and not of heresy. Plots of all kinds went on till the execution of Mary Stuart in 1587. After that time there was less material for plots; but the persecution went on on both sides. But by this time the foreign relations of the kingdom had become even more important than the condition of things at home.

Change in relations with France and Spain.

At the death of Mary Tudor, England was at war with France and in close alliance with Spain. This state of things lasted during the early part of Elizabeth's reign. She helped the French Protestants; but she concluded peace in 1564. During the rest of her reign the old enmity towards France died out. Elizabeth was at one time almost ready to accept a Catholic husband; at another time she again encouraged the French Protestants. But the accession of Henry of Navarre made France and England friends. Henry and Elizabeth had a common enemy. As enmity against France died out, so friendship for Spain died out also. Philip, Elizabeth's first suitor, gradually changed into her most dangerous enemy, the assertor of the claims of Mary, and, after her death, her would-be avenger, and moreover the assertor of the claims of his own daughter as a remote descendant of John of Gaunt. The Armada, the dealings of England with the insurgents in the Netherlands, the expedition to Cadiz, are all events which stand out on the surface of English history. England now stood out as the great Protestant power of Europe, the maintainer of the Protestant cause everywhere. In short, the reign of Elizabeth finally gave to England and Englishmen their special religious character, as earlier times had given them their special political character. That special political character, overshadowed for a while by Tudor despotism, showed itself again towards the end of her reign. The England of the seventeenth century, free and Protestant, was now fully formed. The course of the century of which Elizabeth only saw the opening was to win back the freedom of England, to confirm the national Protestantism, and to take the first steps towards that religious toleration on both sides of which the age of Elizabeth had not dreamed.

---

[1] The evidence on which this statement is made will be found at length in Hook's *Lives of the Archbishops*, viii. 321. It is certainly not such evidence as would be needed to assert the fact with any positiveness; but the tale is not very unlikely in 1560, though it would be quite out of place in 1570. The deliberate invention of the story, unless perhaps at a much later time, would really be more unlikely than the story itself.

England the chief Protestant power.

Discoveries and distant commerce.

But another feature in the character of England was added in the reign of Elizabeth. If England now took up a new and definite position as a European power, the first steps were also taken towards making her more than a European power. In the days of Edward and Mary, English commerce and maritime enterprise had a new range opened to them by the beginning of intercourse with Russia. That nation, great in earlier days on the Euxine, was now shut out from all southern and western outlets, and access to her one haven of Archangel could be had only by the Frozen Ocean and the White Sea. Under Elizabeth maritime enterprise, commercial and warlike, took a far wider range. American colonization did not as yet begin; Indian dominion was yet more distant; but it was in these times that the first steps were taken towards both. The seamen of England now broke into the preserved maritime empire of Spain, and gave the land which was to give birth to Washington a name in honor of their own virgin queen. The merchants of England, chartered as usual as a company, now first made their way to the great Indian continent, to behold, under the rule of Akbar, that religious toleration which Elizabeth denied to Catholic and Puritan. It is hard for us to conceive the effect which was made on men's minds by a change which was practically an enlargement of the bounds of the physical world. If it is absurd to set up the great seamen of Elizabeth's day, Drake and Gilbert and Cavendish and Raleigh, as though they were faultless heroes, it is equally unfair to decry them as mere pirates. They were the natural creation of a new state of things. It was not theoretically justifiable, but it was in no way wonderful, if men of all nations deemed that, in new and barbarous lands and seas, they were set free from the obligations of public law which bound them in their European homes. But one stain, deeper and more lasting, dates from Elizabeth's days. At home personal slavery had long been forgotten, and the last traces of villainage can now be discerned only by the most prying eyes. The distant enterprises of England now brought back in a new shape the shame of our earliest days. The kidnapping and selling of negroes now became a chief branch of English commerce. And it must not be forgotten that, till the humane decisions of the last century, the negro, like the British captive or the English criminal of ancient times, was as much a slave on the soil of England as he was on the soil of America.

The slave trade.

Language of the sixteenth century.

The completed national character of England dates from the days of the Tudors, and mainly from the reign of Elizabeth. From this time, in dealing with the actors in English history, we seem, more thoroughly than in any earlier time, to be dealing with men who are in all things our own fellows. One main cause of this is that the language of the sixteenth century is the earliest form of English which an ordinary modern reader can understand without an effort. The handwriting of the sixteenth century is harder to read than the handwriting of any age before or since. The spelling of the sixteenth century is more chaotic and unreasonable than the spelling of any age before or since. But the language itself, when taken out of its uncouth clothing, is in the main intelligible, even to those who have not made language a special study. The philologer sees that the language of the nineteenth century is the same, by unbroken personal unity, as the language of the fifth century. He sees that the changes which distinguish the language of the nineteenth century from the language of the fifth century were fully accomplished by the fourteenth. But all this is for the philologer. The ordinary reader, who reads merely for the matter or the style of his book, cannot understand the language of the fifth century at all; he can understand the language of the fourteenth century only with an effort. But the language of the sixteenth century is clear to every one who reads with decent attention. It is near enough to the speech of our own times to be understood; it is far enough removed from the speech of our own times to have an archaic flavor, venerable or quaint, according to the matter in hand and its treatment. The literature of the sixteenth century gives us the earliest English writings in prose and verse which we read simply as literature. Spenser and Shakespeare, Hooker and Raleigh, stand to us in a different relation from Cædmon, or even from Chaucer. And, greater than all, the sixteenth century has given us, in our national prayer-book, in our national translation of the Bible,[1] models of the English tongue which, as long as they survive, will survive to rebuke its corrupters. For them we have to thank the reigns of Henry and of Edward. Henry first gave his people the Scriptures in their own tongue, and then restricted their use. But his gift went for more than his restriction. From that day to this the English Bible has been the only literary, as well as the only religious, food of millions of Englishmen. The Puritan lived in the English Bible, as the mediæval scholar had lived in the Latin Bible. That two great works of sixteenth-century English have been familiar to us ever since, while no earlier writing has been commonly known in the like sort, is doubtless one great reason why the English of the sixteenth century is the earliest English which is commonly intelligible. But this is not the only reason. The reign of Elizabeth is in itself the most marked epoch in English literature. The stirring of men's minds which led to the great political and religious events of the age led also to the sudden burst of a whole literature in verse and prose. In the sixteenth century the English drama began, modern English theology began, the writing of history in the modern sense and in the English tongue began. And with the beginning of a school of new writers came a time of more diligent care towards our ancient writers. The fanatic religionists and greedy spoilers of Henry and Edward's days had destroyed ancient records and chronicles by wholesale. The hand of Elizabeth's first primate, the renowned Matthew Parker, was stretched out to save instead of to destroy, to publish instead of to tear in pieces. To his pious care more than to that of any other man, we owe it that the ancient history of England can be read and written.

Elizabethan literature.

The English Bible.

And, as it was with language, so it was with everything else which goes to make up the national life. Its modern form is now completed. We feel that the men of Elizabeth's day, her statesmen, her warriors, her poets, and her divines, are men who come near to ourselves in a way which the men of earlier times cannot do. A gap of more than a generation, of more than two generations, seems to part Wolsey from Burghley. The main features of English social life had really been fixed in the fifteenth century; they do not thoroughly come home to us till the sixteenth. We see this in its outward form in the houses of Elizabeth's reign. They are the earliest houses, great or small, in which a modern Englishman of any class can live with any degree of modern comfort. In point of style, they have fallen away from the models of the early part of the century. The architecture of this age is primarily domestic. For ecclesiastical art there was little room in a time when more churches were pulled down than were built. Repairs were commonly done in a rough and clumsy fashion. Still there are a few ecclesiastical buildings, ranging from Edward VI. to James I., such as the tower of Probus in Cornwall and the choir of Wadham College chapel, in which the older style is still faithfully carried on. The revived Italian style was brought

Elizabethan houses.

---

[1] The authorized version, as it stands, is, as every one knows, a work of the seventeenth century, not of the sixteenth. But it was the work of men whose minds had been formed in the sixteenth century, and the translation of the sixteenth century was taken as its groundwork. Whenever it departs from that model, however much it may gain as a more accurate representation of the original, it loses as a piece of English and English rhythm. Compare the Psalms in the translation of Henry's day and in that of the days of James.

in by Protector Somerset; but, as applied to whole buildings, the fashion did not take; the details became a strange mixture of corrupt English and corrupt Italian; but the outlines are purely English. The Elizabethan houses, with their endless shifting of gables, are often actually more picturesque in outline than the houses of the beginning of the century. They are more distinctly houses; the features handed down by tradition from the castle no longer linger, even as survivals. And they are of all sizes, palaces, manor-houses, burgher dwellings in towns, solitary farm-houses, cottages in the village street. And they are of all materials, stone, brick, or timber, according to the district. They are the houses of an age when law was fully established, and when the different ranks of society, though the distinctions between them were far more sharply drawn, were essentially the same as they are now.

Plunder of bishoprics.

Foundation of colleges and hospitals.

The objects of the bounty of founders were now necessarily changed; but their bounty was by no means worn out. Mary restored several monasteries, which were again suppressed by Elizabeth. Mary also restored a great part of the alienated bishops' lands. The plunder of the bishops also went on all through Elizabeth's reign, and Burghley, Hatton, and Raleigh, and other statesmen and courtiers, made themselves great fortunes at the expense of the Church. But all was not spoliation in this age. Mary and Elizabeth restored some of the collegiate churches which had been suppressed under Edward; the foundation of colleges in the universities went on under both sisters; and this was a special time for the erection of schools and hospitals. Even Leicester has left a memorial of this kind behind him. And it may pass for a kind of charitable foundation on the part of the nation itself, when by a statute of Elizabeth a public provision was first made for the relief of the poor.

Summary.

England and the English people are thus thoroughly formed in the shape which they have kept to this day. Their political constitution has lived through its time of trial, ready to come forth again in its full strength. The religious character of England is fixed; her European position is fixed also. She has become wholly insular, ready to play in European politics the special part of an insular power. At home Wales is incorporated; Ireland, now a kingdom, is brought more nearly than ever under the rule of its queen. The time has now come for a nearer and a friendly union with the other kingdom which hitherto has divided the isle of Britain with England. The lack of direct descendants of Henry, the ill luck of the descendants of his sister Mary, carried the English crown to the descendants of Margaret, and called the king of Scots to the English throne. The union of the crowns led, as a necessary though not an immediate effect, to the union of kingdoms, to the time when England and Scotland, political names, so long rival and hostile names, were merged in the common geographical name of Great Britain.[1] (E. A. F.)

Accession of James I.

James I. and the Catholics.

The defeat of the Spanish Armada in 1588 had been the final victory gained on behalf of the independence of the English church and state. The fifteen years which followed had been years of successful war; but they had been also years during which the nation had been preparing itself to conform its institutions to the new circumstances in which it found itself in consequence of the great victory. When James arrived from Scotland to occupy the throne of Elizabeth he found a general desire for change. Especially there was a feeling that there might be some relaxation in the ecclesiastical arrangements. Roman Catholics and Puritans alike wished for a modification of the laws which bore hardly on them. James at first relaxed the penalties under which the Roman Catholics suffered, then he grew frightened by the increase of their numbers and reimposed the penalties. The Gunpowder Plot (1605) was the result, followed by a sharper persecution than ever.

James I. and the Puritans.

The Puritans were invited to a conference with the king at Hampton Court (1604). They no longer asked, as many of them had asked in the beginning of Elizabeth's reign, to substitute the Presbyterian discipline for the Episcopal government. All they demanded was to be allowed permission whilst remaining as ministers in the church to omit the usage of certain ceremonies to which they objected. It was the opinion of Bacon that it would be wise to grant their request. James thought otherwise, and attempted to carry out the Elizabethan conformity more strictly than it had been carried out in his predecessor's reign.

James I. and the Commons.

In 1604 the Commons agreed with Bacon. They declared that they were no Puritans themselves, but that in such a dearth of able ministers, it was not well to lose the services of any one who was capable of preaching the gospel. By his refusal to entertain their views James placed himself in opposition to the Commons in a matter which touched their deeper feelings. As a necessary consequence every dispute on questions of smaller weight assumed an exaggerated importance. The king had received a scanty revenue with his crown, and he spent freely what little he had. As the Commons offered grudging supplies, the necessity under which he was of filling up the annual deficit led him to an action by which a grave constitutional question was raised.

Question of the impositions.

Breach between the king and the Commons.

From the time of Richard II. to the reign of Mary no attempt had been made to raise duties on exports and imports without consent of parliament. But Mary had, under a specious pretext, recommenced to a slight extent the evil practice, and Elizabeth had gone a little further in the same direction. In 1606 a merchant named Bate resisted the payment of an imposition—as duties levied by the sole authority of the crown were then called. The case was argued in the Court of Exchequer, and was there decided in favor of the crown. Shortly afterwards new impositions were set to the amount of £70,000 a year. When parliament met in 1610 the whole subject was discussed, and it was conclusively shown that, if the barons of the exchequer had been right in any sense, it was only in that narrow technical sense which is of no value at all. A compromise attempted broke down, and the difficulty was left to plague the next generation. The king was always able to assert that the judges were on his side, and it was as yet an acknowledged principle of the constitution that parliament could not change the law without the express consent of the crown, even if, which was not the case in this matter, the Lords had sided with the Commons. James's attempt to obtain further supplies from the Commons by opening a bargain for the surrender of some of his old feudal prerogatives, such as wardship and marriage, which had no longer any real meaning except as a means of obtaining money in an oppressive way, broke down, and early in 1611 James dissolved his first parliament in anger. A second parliament, summoned in 1614, met with the same fate after a session of a few weeks.

The dissolution of this second parliament was followed by a short imprisonment of some of the more active members, and by a demand made through England for a benevolence to make up the deficiency which parliament had neglected to meet. The court represented that, as no compulsion was used, there was nothing illegal in this proceeding. But as the names of those who refused to pay were taken down, it cannot be said that there was no indirect pressure.

Attempted union with Scotland.

The colonization of Ulster.

The most important result of the breach with the parliament of 1614, however, was the resolution taken by James to seek refuge from his financial and other troubles in a close alliance with the king of Spain. His own accession had done much to improve the position of England in its relation with the Continental powers. Scotland was no longer available as a possible enemy to England, and though an attempt to bind the union between the two nations by freedom of commercial intercourse had been wrecked upon the jealousy of the English Commons (1607), a legal decision had granted the status of national subjects to all persons born in Scotland after the king's accession in England. Ireland, too, had been thoroughly overpowered at the end of Elizabeth's reign, and the flight of the earls of Tyrone and Tyrconnel in 1607 had been followed by the settlement of English and Scottish colonists in Ulster, a measure which, in the way in which it was undertaken, sowed the seeds of future evils, but undoubtedly conduced to increase the immediate strength of the English Government in Ireland.

---

[1] James I. was very fond of calling himself "King of Great Britain," a geographical description which reminds one of Cnut's "King of all England." And the same style was freely used by his successors. But the kingdom of Great Britain did not really begin till Anne's Act of Union. The more accurate, though rarer, style of the Stuarts is "King of England, Scotland, France, and Ireland."

The peace with Spain.

Without fear of danger at home, therefore, James, who as king of Scotland had taken no part in Elizabeth's quarrel with Philip II., not only suspended hostilities immediately on his accession, and signed a peace in the following year, but looked favorably on the project of a Spanish alliance, in order that the chief Protestant and the chief Catholic powers might join together to impose peace on Europe, in the place of those hideous religious wars by which the last century had been disfigured. In 1611 circumstances had disgusted him with his new ally, but in 1614 he courted him again, not only on grounds of general policy, but because he hoped that the large portion which would accompany the hand of an infanta would go far to fill the empty treasury.

The Spanish alliance.

The Thirty Years' War.

In this way the Spanish alliance, unpopular in itself, was formed to liberate the king from the shackles imposed on him by the English constitution. Its unpopularity, great from the beginning, became greater when Raleigh's execution (1618) caused the Government to appear before the world as truckling to Spain. The obloquy under which James labored increased when the Thirty Years' War broke out (1618), and when his daughter Elizabeth, whose husband, the Elector Palatine, was the unhappy claimant to the Bohemian crown (1619), stood forth as the lovely symbol of the deserted Protestantism of Europe. Yet it was not entirely in pity for German Protestants that the heart of Englishmen beat. Men felt that their own security was at stake. The prospect of a Spanish infanta as the bride of the future king of England filled them with suspicious terrors. In Elizabeth's time the danger, if not entirely external, did not come from the Government itself. Now the favor shown to the Roman Catholics by the king opened up a source of mischief which was to some extent real, if it was to a still greater extent imaginary. Whether the danger were real or imaginary, the consequence of the distrust resulting from the suspicion was the reawakening of the slumbering demand for fresh persecution of the Roman Catholics, a demand which made a complete reconciliation between the crown and the Lower House a matter of the greatest difficulty.

The third parliament of James I.

In 1621 the third parliament of James was summoned to provide money for the war in defence of his son-in-law's inheritance in the Palatinate, which he now proposed to undertake. But it soon appeared that he was not prepared immediately to come to blows, and the Commons, voting a small sum as a token of their loyalty, passed to other matters.

Monopolies attacked.

Indolent in his temper, James had been in the habit of leaving his patronage in the hands of a confidential favorite, and that position was now filled by George Villiers, marquis and afterwards duke of Buckingham. The natural consequence was that men who paid court to him were promoted, and those who kept at a distance from him had no notice taken of their merits. Further, a system of granting monopolies and other privileges had again sprung up. Many of these grants embodied some scheme which was intended to serve the interests of the public, and many actions which appear startling to us were covered by the extreme protectionist theories then in vogue. But abuses of every kind had clustered round them, and in many cases the profits had gone into the pockets of hangers-on of the court, whilst officials had given their assistance to the grantors even beyond their legal powers. James was driven by the outcry raised to abandon these monopolies, and an Act of Parliament in 1624 placed the future grant of protections to new inventions under the safeguard of the judges.

Fall of Bacon.

The attack on the monopolies was followed by charges brought by the Commons before the Lords against persons implicated in carrying them into execution, and subsequently against Lord Chancellor Bacon as guilty of corruption. The sentence passed by the Lords vindicated the right of parliament to punish officials who had enjoyed the favor of the crown, which had fallen into disuse since the accession of the House of York. There was no open contest between parliament and king in this matter. But the initiative of demanding justice had passed from the crown to the Commons. It is impossible to overestimate the effect of these proceedings on the position of parliament. The crown could never again be regarded as the sun of the governmental system.

Dissolution of parliament.

When the Commons met after the summer adjournment a new constitutional question was raised. The king was at last determined to find troops for the defence of the Palatinate, and asked the Commons for money to pay them. They in turn petitioned the crown to abandon the Spanish alliance, which they regarded as the source of all the mischief. James told them that they had no right to discuss business on which he had not asked their opinion. They declared that they were privileged to discuss any matter relating to the commonwealth which they chose to take in hand, and embodied their opinion in a protest, which they entered on their journals. The king tore the protest out of the book, and dissolved parliament.

The journey to Madrid.

Then followed a fresh call for a benevolence, this time more sparingly answered than before. A year of fruitless diplomacy failed to save the Palatinate from total loss. The ill-considered journey to Madrid, in which Prince Charles, accompanied by Buckingham, hoped to wring from the Spanish statesmen a promise to restore the Palatinate in compliment for his marriage with the infanta, ended also in total failure. In the autumn of 1623 Charles returned to England without a wife, and without hope of regaining the Palatinate with Spanish aid.

The French alliance.

He came back resolved to take vengeance upon Spain. The parliament elected in 1624 was ready to second him. It voted some supplies on the understanding that, when the king had matured his plans for carrying on the war, it should come together in the autumn to vote the necessary subsidies. It never met again. Charles had promised that, if he married a Roman Catholic lady, he would grant no toleration to the English Catholics in consideration of the marriage. In the autumn he had engaged himself to marry Henrietta Maria, the sister of the king of France, and had bound himself to grant the very conditions which he had declared to the Commons that he never would concede. Hence it was that he did not venture to recommend his father to summon parliament till the marriage was over. But though there was but little money to dispose of, he and Buckingham, who, now that James was sick and infirm, were the real leaders of the Government, could not endure to abstain from the prosecution of the war. Early in 1625 an expedition, under Count Mansfeld, was sent to Holland, that it might ultimately cut its way to the Palatinate. Left without pay and without supplies, the men perished by thousands, and when James died in March, the new king had to meet his first parliament burdened by a broken promise and a disastrous failure.

The first years of Charles I.

When parliament met (1625) the Commons at first contented themselves with voting a sum of money far too small to carry on the extensive military and naval operation in which Charles had embarked. When the king explained his necessities, they intimated that they had no confidence in Buckingham, and asked that, before they granted further supply, the king would name counsellors whom they could trust, to advise him on its employment. Charles at once dissolved parliament. He knew that the demand for ministerial responsibility would in the end involve his own responsibility, and, believing as he did that Buckingham's arrangements had been merely unlucky, he declined to sacrifice the minister whom he trusted.

Charles and Buckingham did their best to win back popularity by strenuous exertion. They attempted to found a great Protestant alliance on the Continent, and they sent a great expedition to Cadiz. The Protestant alliance and the expedition to Cadiz ended in equal failure. The second parliament of the reign (1626) impeached Buckingham for crimes against the state. As Charles would not dismiss him simply because the Commons were dissatisfied with him as a minister, they fell back on charging him with criminal designs. Once more Charles dissolved parliament to save Buckingham. Then came fresh enterprises and fresh failures. A fleet under Lord Willoughby was almost ruined by a storm. The king of Denmark, trusting to supplies from England which never came, was defeated at Lutter. A new war, in addition to the Spanish war, broke out with France. A great expedition to Rhé, under Buckingham's command (1627), intended to succor the Huguenots of Rochelle against their sovereign, ended in disaster. In order to enable himself to meet expenditure on so vast a scale, Charles had levied a forced loan from his subjects. Men of high rank in society who refused to pay were imprisoned. Soldiers were billeted by force in private houses, and military officers executed martial law on civilians. When the imprisoned gentlemen appealed to the King's Bench for a writ of *habeas corpus*, it appeared that no cause of committal had been assigned, and the judges therefore refused to liberate them. Still Charles believed it possible to carry on the war, and especially to send relief to Rochelle, now strictly blockaded by the French Government. In order to find the means for this object he summoned his third parliament (1628). The Commons at once proceeded to draw a line which should cut off the possibility of a repetition of the injuries of which they complained. Charles was willing to surrender his claim to billet soldiers by force, to order the execution of martial law in time of peace, and to exact forced loans, benevolences, or any kind of taxation, without consent of parliament; but he protested against the demand that he should surrender the right to imprison without showing cause. It was argued on his behalf that in case of a great conspiracy, it would be necessary to trust the crown with unusual powers to enable it to preserve the peace. The Commons, who knew that the crown had used the powers which it claimed, not against conspirators, but against the commonwealth itself, refused to listen to the argument, and insisted on the acceptance of the whole Petition of Right, in which they demanded redress for all their grievances. The king at last gave his consent to it, as he could obtain money in no other way. In after times, when any real danger occurred which needed a suspension of the ordinary safeguards of liberty, a remedy was found in the suspension of the law by Act of Parliament; such a remedy, however, only became possible when king and parliament were on good terms of agreement with one another.

The Petition of Right.

Disputes on religion and taxation.

That time was as yet far distant. The House of Commons brought fresh charges against Buckingham, whose murder soon after the prorogation removed one subject of dispute. But when they met again (1629) they had two quarrels left over from the preceding session. About a third part of the king's revenue was derived from customs duties, which had for many generations been granted by parliament to each sovereign for life. Charles held that this grant was little more than a matter of form, whilst the Commons held that it was a matter of right. But for the other dispute the difficulty would probably have been got over. The strong Protestantism of Elizabeth's reign had assumed a distinctly Calvinistic form, and the country gentlemen who formed the majority of the House of Commons were resolutely determined that no other theology than the Calvinistic should be taught in England. In the last few years a reaction against it had arisen, especially in the universities, and those who adopted an unpopular creed, and who at the same time showed tendencies to a more ceremonial form of worship, naturally fell back on the support of the crown. Charles, who might reasonably have exerted himself to secure a fair liberty for all opinions, promoted these unpopular divines to bishoprics and livings, and the divines in turn exalted the royal prerogative above parliamentary rights. He now proposed that both sides should keep silence on the points in dispute. The Commons rejected his scheme, and prepared to call in question the most obnoxious of the clergy. In this irritated temper they took up the question of tonnage and poundage, and instead of confining themselves to the great public question, they called to the bar some custom-house officers who happened to have seized the goods of one of their members. Charles declared that the seizure had taken place by his orders. When they refused to accept the excuse, he dissolved parliament, but not before a tumult took place in the House, and the speaker was forcibly held down in his chair whilst resolutions hostile to the Government were put to the vote.

Eleven years without a parliament.

For eleven years no parliament met again. The extreme action of the Lower House was not supported by the people, and the king had the opportunity, if he chose to use it, of putting himself right with the nation after no long delay. But he never understood that power only attends sympathetic leadership. He contented himself with putting himself technically in the right, and with resting his case on the favorable decisions of the judges. Under any circumstances, neither the training nor the position of judges is such as to make them fit to be the final arbiters of political disputes. They are accustomed to declare what the law is, not what it ought to be. These judges, moreover, were not in the position to be impartial. They had been selected by the king, and were liable to be deprived of their office when he saw fit. In the course of Charles's reign two chief justices and one chief baron were dismissed or suspended. Besides the ordinary judges there were the extraordinary tribunals, the court of High Commission nominated by the crown to punish ecclesiastical offenders, and the Court of Star-Chamber, composed of the Privy Councillors and the chief justices, and therefore also nominated by the crown, to inflict fine, imprisonment, and even corporal mutilation on lay offenders. Those who rose up in any way against the established order were sharply punished.

Ship-money.

The harsh treatment of individuals only calls forth resistance when constitutional morality has sunk deeply into the popular mind. The ignoring of the feelings and prejudices of large classes has a deeper effect. Charles's foreign policy, and his pretentious claim to the sovereignty of the British seas, demanded the support of a fleet, which might indeed be turned to good purpose in offering a counterpoise to the growing navies of France and Holland. The increasing estrangement between him and the nation made him averse to the natural remedy of a parliament, and he reverted to the absolute practices of the Middle Ages, in order that he might strain them far beyond the warrant of precedent to levy a tax under the name of ship-money, first on the port towns and then on the whole of England. Payment was resisted by John Hampden, a Buckinghamshire squire; but the judges declared that the king was in the right (1638). Yet the arguments used by Hampden's lawyers sunk deeply into the popular mind, and almost every man in England who was called on to pay the tax looked upon the king as a wrong-doer under the forms of law.

Laud's government of the church.

Any Government which, from want of sympathy with the feelings of the masses, offends the sense of right by the levy of taxes for which it does not venture to ask their consent, is also likely to treat with unfeeling harshness the religion of thinking men. So it was in the reign of Charles. He gave authority to William Laud, since 1633 archbishop of Canterbury, to carry out his design of reducing the English Church to complete uniformity of ceremonial. The practice in most churches differed from the laws under which public worship was intended to be guided. Laud did his best to carry out the letter of the law, under the belief that uniformity of worship would produce unity of spirit, and in some cases he explained away the law in the direction in which he wished it to be bent. The communion table was removed from the centre of the church to the east end, was spoken of as an altar, and was fenced in with rails, at which communicants were expected to kneel. At the same time offence was given to the Puritans by an order that every clergyman should read the Declaration of Sports, in which the king directed that no hinderance should be thrown in the way of those who wished to dance or shoot at the butts on Sunday afternoon. Many of the clergy were suspended or deprived, many emigrated to Holland or New England, and of those who remained, a large part bore the yoke with feelings of ill-concealed dissatisfaction. Suspicion was easily aroused that a deep plot existed, of which Laud was believed to be the centre, for carrying the nation over to the Church of Rome, a suspicion which seemed to be converted into a certainty when it was known that Panzani and Con, two agents of the pope, had access to Charles, and that in 1637 there was a sudden accession to the number of converts to the Papal Church amongst the lords and ladies of the court. The rising feeling may be traced in the poems of Milton. *L'Allegro* and *Il Penseroso*—probably written in 1632—are full of thoughts which denote him to have been at that time of no special school. The *Comus*, written in 1634, is stamped with the impress of the Puritan ideal without the Puritan asperity; whilst the *Lycidas*, in 1637, contains lines directed aggressively against the system of Laud as serving merely as a stepping stone to Rome.

In the summer of 1638 Charles had long ceased to reign in the affections of his subjects. But their traditionary loyalty had not yet failed, and if he had not called on them for fresh exertions, it is possible that the coming revolution would have been long delayed. Men were ready to shout applause in honor of Puritan martyrs like Prynne, Burton, and Bastwick, whose ears were cut off in 1637, or in honor of the lawyers who argued such a case as that of Hampden. But no signs of active resistance had yet appeared. Unluckily for Charles, he was likely to stand in need of the active co-operation of Englishmen. He had attempted to force a new Prayer-Book upon the Scottish nation. A riot at Edinburgh in 1637 quickly led to national resistance, and when in November, 1638, the General Assembly at Glasgow set Charles's orders at defiance, he was compelled to choose between tame submission and immediate war. In 1639 he gathered an English force, and marched towards the border. But English laymen, though asked to supply the money which he needed for the support of his army, deliberately kept it in their pockets, and the contributions of the clergy and of official persons were not sufficient to enable him to keep his troops long in the field. The king therefore thought it best to agree to terms of pacification. Misunderstandings broke out as to the interpretation of the treaty, and Charles having discovered that the Scotch were intriguing with France, fancied that England, in hatred of its ancient foe, would now be ready to rally to his standard. After an interval of eleven years, in April, 1640, he once more called a parliament.

The Scottish resistance.

The Short Parliament.

The Scottish invasion.

The Short Parliament, as it was called, demanded redress of grievances, the abandonment of the claim to levy ship-money, and a complete change in the ecclesiastical system. Charles thought that it would not be worth while even to conquer Scotland on such terms, and dissolved parliament. A fresh war with Scotland followed. Wentworth, now earl of Strafford, became the leading adviser of the king. With all the energy of his disposition he threw himself into Charles's plans, and left no stone unturned to furnish the new expedition with supplies and money. But no skilfulness of a commander can avail when soldiers are determined not to fight. The Scotch crossed the Tweed, and Charles's army was well pleased to fly before them. In a short time the whole of Northumberland and Durham were in the hands of the invaders. Charles was obliged to leave these two counties in their hands as a pledge for the payment of their expenses; and he was also obliged to summon parliament to grant him the supplies which he needed for that object.

Meeting of Long Parliament.

When the Long Parliament met in November, 1640, they were in a position in which no parliament had been before. Though nominally the Houses did not command a single soldier, they had in reality the whole Scottish army at their back. By refusing supplies they would put it out of the king's power to fulfil his engagements to that army, and it would immediately pursue its onward march to claim its rights.

Attainder of Strafford.

Overthrow of arbitrary government.

Hence there was scarcely anything which the king could venture to deny the Commons. Under Pym's leadership, they began by asking the head of Strafford. Nominally he was accused of a number of acts of oppression in the north of England and in Ireland. His real offence lay in his attempt to make the king absolute, and in the design with which he was credited of intending to bring over an Irish army to crush the liberties of England. If he had been a man of moderate abilities he might have escaped. But the Commons feared his commanding genius too much to let him go free. They began with an impeachment. Difficulties arose, and the impeachment was turned into a bill of attainder. The king abandoned his minister, and the execution of Strafford left Charles without a single man of supreme ability on his side. Then came rapidly a succession of blows at the supports by which the Tudor monarchy had been upheld. The courts of Star-Chamber and High Commission and the Council of the North were abolished. The raising of tonnage and poundage without a parliamentary grant was declared illegal. The judges who had given obnoxious decisions were called to answer for their fault, and were taught that they were responsible to the House of Commons as well as to the king. Finally, a bill was passed providing that the existing House should not be dissolved without its own consent.

Division of the House into parties.

It was clearly a revolutionary position which the House had assumed. But it was assumed because it was impossible to expect that a king who had ruled as Charles had ruled could take up a new position as the exponent of the feelings which were represented in the Commons. As long as Charles lived he could not be otherwise than an object of suspicion; and yet if he were dethroned there was no one available to fill his place. There arose therefore two parties in the House, one ready to trust the king, the other disinclined to put any confidence in him at all. The division was the sharper because it coincided with a difference in matters of religion. Scarcely any one wished to see the Laudian ceremonies upheld. But the members who favored the king, and who formed a considerable minority, wished to see a certain liberty of religious thought, together with a return under a modified Episcopacy to the forms of worship which prevailed before Laud had taken the church in hand. The other side, which had the majority by a few votes, wished to see the Puritan creed prevail in all its strictness, and were favorable to the establishment of the Presbyterian discipline. The king, by his unwise action, threw power into the hands of his opponents. He listened with tolerable calmness to their Grand Remonstrance, but his attempt to seize the five members whom he accused of high treason made a good understanding impossible. The Scottish army had been paid off some months before, and civil war was the only means of deciding the quarrel.

The civil war.

At first the fortune of war wavered. Edgehill was a drawn battle (1642), and the campaign of 1643, though it was on the whole favorable to the king, gave no decisive results. Before the year was at an end parliament invited a new Scottish army to intervene in England. As an inducement, the Solemn League and Covenant was signed by all Parliamentarian Englishmen, the terms of which were interpreted by the Scotch to bind England to submit to Presbyterianism, though the most important clauses had been purposely left vague, so as to afford a loophole of escape.

Presbyterians and Independents.

The battle of Marston Moor, with the defeat of the Royalist forces in the north, was the result. But the battle did not improve the position of the Scots. They had been repulsed, and the victory was justly ascribed to the English contingent. The composition of that contingent was such as to have a special political significance. Its leader was Oliver Cromwell. It was formed by men who were fierce Puritan enthusiasts, and who for the very reason that the intensity of their religion separated them from the mass of their countrymen, had learned to uphold with all the energy of zeal the doctrine that neither Church nor State had a right to interfere with the forms of worship which each congregation might select for itself. They were commonly known as Independents, from the communities which had sprung up under the name of Separatists in the reign of Elizabeth, and which maintained the principle of congregational independence; though many other sects found a place in their ranks.

Comprehension and toleration.

The principle advocated by the army, and opposed by the Scotch and the majority of the House of Commons, was liberty of sectarian association. Some years earlier, under the dominion of Laud, another principle had been proclaimed by Chillingworth and Hales, that of liberty of thought to be maintained within the unity of the church. Both these movements conduced to the ultimate establishment of toleration,—the one by permitting those to worship as they saw fit whose faith was too definite to enable them to be content with outward forms by which their particular belief was not clearly expressed, the other by allowing those whose charity was greater than their polemical zeal to find a common ground to worship side by side with others whose beliefs did not entirely coincide with their own.

Overthrow of the king.

For the present the Independents were to have their way. The Presbyterian leaders, Essex and Manchester, were not successful leaders. The army was remodelled after Cromwell's pattern, and the king was finally crushed at Naseby (1645). The next year (1646) he surrendered to the Scots. Then followed two years of fruitless negotiation, in which, after the Scotch abandoned the king to the English parliament, the army took him out of the hands of the parliament, whilst each in turn tried to find some basis of arrangement on which he might appear to sit on the throne without again misdi-

The second civil war.

Execution of the king.

recting the government. Such a basis could not be found, and when Charles stirred up a fresh civil war and a Scottish invasion (1648), the leaders of the army vowed that, if victory was theirs, they would bring him to justice. To do this it was necessary to drive out a large number of the members of the House of Commons, by what was known as Pride's Purge, and to obtain from the mutilated Commons the dismissal of the House of Lords, and the establishment of a high court of justice, before which the king was brought to trial, and sentenced to death. He was beheaded on a scaffold outside the windows of Whitehall (1649).

The Commonwealth.

The Protectorate.

The government set up was a government by the committees of a council of state nominally supporting themselves on the House of Commons, though the members who still retained their places were so few that the council of state was sufficiently numerous to form a majority in the House. During eleven years the nation passed through many vicissitudes in its forms of government. These forms take no place in the gradual development of English institutions, and have never been referred to as affording precedents to be followed. To the student of political science, however, they have a special interest of their own, as they show that when men had shaken themselves loose from the chain of habit and prejudice, and had set themselves to build up a political shelter under which to dwell, they were irresistibly attracted by that which was permanent in the old constitutional forms of which the special development had of late years been so disastrous. After Cromwell had suppressed resistance in Ireland (1649), had conquered Scotland (1650), and had overthrown the son of the late king, the future Charles II., at Worcester (1651), the value of government by an assembly was tested and found wanting. After Cromwell had expelled the remains of the Long Parliament (1653), and had set up another assembly of nominated members, that second experiment was found equally wanting. It was necessary to have recourse to one head of the executive government, controlling and directing its actions. Cromwell occupied this position as Lord Protector. He did all that it was in his power to do to prevent his authority from degenerating into tyranny. He summoned two parliaments, of only one House, and with the consent of the second parliament he erected a second House, so that he might have some means of checking the Lower House without constantly coming into personal collision with its authority. As far as form went, the constitution in 1658, so far as it differed from the Stuart constitution, differed for the better. But it suffered from one fatal defect. It was based on the rule of the sword. The only substitute for traditional authority is the clearly expressed expression of the national will, and it is impossible to doubt that if the national will had been expressed it would have swept away Cromwell and all his system. The majority of the upper and middle classes, which had united together against Laud, was now re-united against Cromwell. The Puritans themselves were but a minority, and of that minority considerable numbers disliked the free liberty accorded to the sects. Whilst the worship of the Church of England was proscribed, every illiterate or frenzied enthusiast was allowed to harangue at his pleasure. Those who cared little for religion felt insulted when they saw a Government with which they had no sympathy ruling by means of an army which they dreaded and detested. Cromwell did his best to avert a social revolution, and to direct the energies of his supporters into the channels of merely political change. But he could not prevent, and it cannot be said that he wished to prevent, the rise of men of ability from positions of social inferiority. The nation had striven against the arbitrary government of the king; but it was not prepared to shake off the predominance of that widely spreading aristocracy which, under the name of country gentlemen, had rooted itself too deeply to be easily passed by. Cromwell's rule was covered with military glory, and there can be no doubt that he honestly applied himself to solve domestic difficulties as well. But he reaped the reward of those who strive for something better than the generation in which they live is able to appreciate. His own faults and errors were remembered against him. He tried in vain to establish constitutional government and religious toleration. When he died (1658) there remained branded on the national mind two strong impressions which it took more than a century to obliterate—the dread of the domination of a standing army, and abhorrence of the very name of religious zeal.

The anarchy.

The eighteen months which followed deepened the impression thus formed. The army had appeared a hard master when it lent its strength to a wise and sagacious rule. It was worse when it undertook to rule in its own name, to set up and pull down parliaments and Governments. The only choice left to the nation seemed to be one between military tyranny and military anarchy. Therefore it was that when Monk advanced from Scotland and declared for a free parliament, there was little doubt that the new parliament would recall the exiled king, and seek to build again on the old foundations.

The Restoration.

The Restoration was effected by a coalition between the Cavaliers, or followers of Charles I., and the Presbyterians who had originally opposed him. It was only after the nature of a great reaction that the latter should for a time be swamped by the former. When the Long Parliament of the Restoration met in 1661, the Act of Uniformity entirely excluded all idea of reform in the Puritan direction, and ordered the expulsion from their benefices of all clergymen who refused to express approval of the whole of the Book of Common Prayer (1662). A previous statute, the Corporation Act (1661), ordered that all members of corporations should renounce the Covenant and the doctrine that subjects might in any case rightfully use force against the king, and should receive the sacrament after the forms of the Church of England. The object for which Laud had striven, the compulsory imposition of uniformity, thus became part of the law of the land.

Prospects of toleration.

Herein lay the novelty of the system of the Restoration. The system of Laud and the system of Cromwell had both been imposed by a minority which had possessed itself of the powers of government. The new uniformity was imposed by parliament, and parliament had the nation behind it. For the first time, therefore, all those who objected to the established religion sought, not to alter its forms to suit themselves, but to gain permission to worship in separate congregations. Ultimately, the Dissenters, as they began to be called, would obtain their object. As soon as it became clear to the mass of the nation that the dissenters were in a decided minority, there would be no reason to fear the utmost they could do even if the present liberty of worship and teaching were conceded to them. For the present, however, they were feared out of all proportion to their numbers. They counted amongst them the old soldiers of the Protectorate, and though that army had been dissolved, it always seemed possible that it might spring to arms once more. A bitter experience had taught men that a hundred of Oliver's Ironsides might easily chase a thousand Cavaliers; and as long as this danger was believed to exist, every effort would be made to keep dissent from spreading. Hence the Conventicle Act (1664) imposed penalties on those taking part in religious meetings in private houses, and the Five Mile Act (1665) forbade the expelled clergyman to come within five miles of a corporate borough, the very place where he was most likely to secure adherence, unless he would swear his adhesion to the doctrine of non-resistance.

Doctrine of non-resistance.

The first Dutch war.

The doctrine of non-resistance was evidently that by which, at this time, the loyal subject was distinguished from those whom he stigmatized as disloyal. Yet even the most loyal found that, if it was wrong to take up arms against the king, it might be right to oppose him in other ways. Even the Cavaliers did not wish to see Charles II. an absolute sovereign. They wished to reconstruct the system which had been violently interrupted by the events of the autumn of 1641, and to found government on the co-operation between king and parliament, without defining to themselves what was to be done if the king's conduct became insufferable. Openly, indeed, Charles II. did not force them to reconsider their position. He did not thrust members of the Commons into prison, or issue writs for ship-money. He laid no claim to taxation which had not been granted by parliament. But he was extravagant and self-indulgent, and he wanted more money than they were willing to supply. A war with the Dutch broke out, and there were strong suspicions that Charles applied money voted for the fleet to the maintenance of a vicious and luxurious court. Against the vice and luxury, indeed, little objection was likely to be brought. The over-haste of the Puritans to drill England into ways of morality and virtue had thrown at least the upper classes into a slough of revelry and baseness. But if the vice did not appear objectionable the expense did, and a new chapter in the financial history of the Government was opened when the Commons, having previously gained control over taxation, proceeded to vindicate their right to control expenditure.

The Commons aim at control over expenditure.

As far, indeed, as taxation was concerned, the Long Parliament had not left its successor much to do. The abolition of feudal tenures and purveyance had long been demanded, and the conclusion of an arrangement which had been mooted in the reign of James I. is only notable as affording one instance out of many of the tendency of a single class to shift burdens off its own shoulders. The predominant landowners preferred the grant of an excise which would be taken out of all pockets to a land-tax which would exclusively be felt by those who were relieved by the abolition of the tenures. The question of expenditure was constantly telling on the relations between the king and the House of Commons. After the Puritan army had been disbanded, the king resolved to keep on foot a petty force of 5000 men, and he had much difficulty in providing for it out of a revenue which had not been intended by those who voted it to be used for such a purpose. Then came the Dutch war, bringing with it a suspicion that some at least of the money given for paying sailors and fitting out ships was employed by Charles on very different objects. The Commons accordingly, in 1665, succeeded in enforcing, on precedents derived from the reigns of Richard II. and Henry IV., the right of appropriating the supplies granted to special objects; and with more difficulty they obtained, in 1666, the appointment of a commission empowered to investigate irregularities in the issue of moneys. Such measures were the complement of the control over taxation which they had previously gained, and as far as their power of supervision went, it constituted them and not the king the directors of the course of government. If this result was not immediately felt, it was because the king had a large certain revenue voted to him for life, so that, for the present at least, it was only his extraordinary expenses which could be brought under parliamentary control. Nor did even the renewal of parliamentary impeachment, which ended in the banishment of Lord Chancellor Clarendon (1667), bring on any direct collision with the king. If the Commons wished to be rid of him because he upheld the prerogative, the king was equally desirous to be rid of him because he looked coldly on the looseness of the royal morals.

Danger from France.

The great motive power of the later politics of the reign was to be found beyond the Channel. To the men of the days of Charles II. Lewis XIV. of France was what Philip II. of Spain had been to the men of the days of Elizabeth. Gradually, in foreign policy, the commercial emulation with the Dutch, which found vent in one war in the time of the Commonwealth, and in two wars in the time of Charles II., gave way to a dread, rising into hatred, of the arrogant potentate who, at the head of the mightiest army in Europe, treated with contempt all rights which came into collision with his own wishes. Nor was Lewis XIV. merely to be feared as a military or political opponent. Even when he was on bad terms with the pope he was a warm upholder of the Papal Church, and Protestants began to ask whether their religion would long be safe if other states succumbed to his arms. Soon, too, suspicions arose that there were those in England who might be glad to use his assistance for the overthrow of Protestantism at home.

In fact, the danger was to the full as great as it was imagined to be. The king was as much a Roman Catholic as he was anything at all, and in his annoyance at the interference of the Commons with his expenditure he thought it a fine thing to lead an easy uncontrolled existence as the pensioner of the great king. In 1670 the secret treaty of Dover was signed. Charles was to receive from Lewis £200,000 a year, and the aid of 6000 French troops, to enable him to declare himself a convert, and to obtain special advantages for his religion, whilst he was also to place the forces of England at Lewis's disposal for his purposes of aggression on the Continent.

Second Dutch war, and Declaration of Indulgence.

Charles had no difficulty in stirring up the commercial jealousy of England so as to bring about a second Dutch war (1672). The next year, unwilling to face the dangers of his larger plan, he issued a Declaration of Indulgence (1673). By a single act of the prerogative the king suspended all penal laws against Roman Catholics and dissenters alike.

The Declaration of Indulgence withdrawn.

The Cavalier parliament had been gradually drifting into opposition to the crown. But to the end it was true to its resolution to retain the political predominance of the English Church. It dreaded the Roman Catholics. It hated and despised the dissenters. Under any circumstances an indulgence would have been most distasteful to it. But the growing belief that the whole scheme was merely intended to serve the purposes of the Roman Catholics converted its dislike into deadly opposition. Yet it resolved to base its opposition upon constitutional grounds. The right claimed by the king to suspend the laws was questioned, and his claim to special authority in ecclesiastical matters was treated with contempt. The king gave way, and withdrew his declaration. But no solemn Act of Parliament declared it to be illegal, and in due course of time it would be heard of again.

The Test Act.

The Commons followed up their blow by passing the Test Act, making the reception of the sacrament according to the forms of the Church of England, and the renunciation of the doctrine of transubstantiation, a necessary qualification for office. At once it appeared what a hold the members of the obnoxious church had had upon the administration of the state. The lord high admiral, the lord treasurer, and a secretary of state refused to take the test. The lord high admiral was the heir to the throne, the king's brother, the duke of York.

Danby's ministry.

Charles, as usual, bent before the storm. In Danby he found a minister whose views answered precisely to the views of the existing House of Commons. Like the Commons, Danby wished to silence both Roman Catholics and dissenters. Like the Commons, too, he wished to embark on a foreign policy hostile to France. But he served a master who regarded Lewis less as a possible adversary than as a possible paymaster. Sometimes Danby was allowed to do as he liked, and the marriage of the duke of York's eldest daughter Mary to her cousin the Prince of Orange was the most lasting result of his administration. More often he was obliged to follow where Charles led, and Charles was constantly ready to sell the neutrality of England for large sums of French gold. At last one of these negotiations was detected, and Danby, who was supposed to be the author instead of the unwilling instrument of the intrigue, was impeached. In order to save his minister, Charles dissolved parliament (1678).

The Popish plot.

Charles could not have chosen a more unlucky time for his own quiet. The strong feeling against the Roman Catholics had been quickened into a flame by a great imposture. The inventors of the so-called Popish plot charged the leading English Roman Catholics with a design to murder the king. Judges and juries alike were maddened with excitement, and listened greedily to the lies which poured forth from the lips of profligate informers. Innocent blood was shed in abundance.

Three short parliaments.

The Exclusion Bill.

The excitement had its root in the uneasy feeling caused by the knowledge that the heir to the throne was a Roman Catholic. Three parliaments were summoned and dissolved. In each parliament the main question at issue between the Commons and the crown was the Exclusion Bill, by which the Commons sought to deprive the duke of York of his inheritance; and it was notorious that the leaders of the movement wished the crown to descend to the king's illegitimate son, the duke of Monmouth.

Whigs and Tories.

The principles by which the Commons were guided in these parliaments were very different from those which had prevailed in the first parliament of the Restoration. Those principles to which that party adhered which about this time became known as the Tory party had been formed under the influence of the terror caused by militant Puritanism. In the state the Tory inherited the ideas of Clarendon, and, without being at all ready to abandon the claims of parliaments, nevertheless somewhat inconsistently spoke of the king as ruling by a divine and indefeasible title, and wielding a power which it was both impious and unconstitutional to resist by force. In the church he inherited the ideas of Laud, and saw in the maintenance of the Act of Uniformity the safeguard of religion. But the hold of these opinions on the nation had been weakened with the cessation of the causes which had produced them. In 1680 twenty years had passed since the Puritan army had been disbanded. Many of Cromwell's soldiers had died, and most of them were growing old. The dissenters had shown no signs of engaging in plots or conspiracies. They were known to be only a comparatively small minority of the population, and though they had been cruelly persecuted, they had suffered without a thought of resistance. Dread of the dissenters, therefore, had become a mere chimæra, which only those could entertain whose minds were influenced by prejudice. On the other hand, dread of the Roman Catholics was a living force. Unless the law were altered a Roman Catholic would be on the throne, wielding all the resources of the prerogative, and probably supported by all the resources of the king of France. Hence the leading principle of the Whigs, as the predominant party was now called, was in the state to seek for the highest national authority in parliament rather than in the king, and in the church to adopt the rational theology of Chillingworth and Hales, whilst looking to the dissenters as allies against the Roman Catholics, who were the enemies of both.

Tory reaction.

Events were to show that it was a wise provision which led the Whigs to seek to exclude the duke of York from the throne. But their plan suffered under two faults, the conjunction of which was ruinous to them for the time. In the first place, their choice of Monmouth as the heir was infelicitous. Not only was he under the stain of illegitimacy, but his succession excluded the future succession of Mary, whose husband, the prince of Orange, was the hope of Protestant Europe. In the second place, drastic remedies are never generally acceptable when the evil to be remedied is still in the future. When in the third of the short parliaments held at Oxford the Whigs rode armed into the city, the nation decided that the future danger of a Roman Catholic succession was incomparably less than the immediate danger of another civil war. Loyal addresses poured in to the king. For the four remaining years of his reign he ruled without summoning any parliament. Whigs were brought before prejudiced juries and partial judges. Their blood flowed on the scaffold. The charter of the city of London was confiscated. The reign of the Tories was unquestioned. Yet it was not quite what the reign of the Cavaliers had been in 1660. The violence of the Restoration had been directed primarily against Puritanism, and only against certain forms of government so far as they allowed Puritans to gain the upper hand. The violence of the Tories was directed against rebellion and disorder, and only against dissenters so far as they were believed to be fomenters of disorder. Religious hatred had less part in the action of the ruling party, and even from its worst actions a wise man might have predicted that the day of toleration was not so far off as it seemed.

First years of the reign of James II.

The accession of James II. (1689) put the views of the opponents of the Exclusion Bill to the test. A new parliament was elected, almost entirely composed of decided Tories. A rebellion in Scotland, headed by the earl of Argyll, and a rebellion in England, headed by the duke of Monmouth, were easily suppressed. But the inherent difficulties of the king's position were not thereby overcome. It would have been hard, in days in which religious questions occupied so large a space in the field of politics, for a Roman Catholic sovereign to rule successfully over a Protestant nation. James set himself to make it, in his case, impossible. It may be that he did not consciously present to himself any object other than fair treatment for his co-religionists. On the one hand, however, he alienated even reasonable opponents by offering no guarantees that equality so gained would not be converted into superiority by the aid of his own military force and of the assistance of the French king; whilst on the other hand he relied, even more strongly than his father had done, on the technical legality which exalted the prerogative in defiance of the spirit of the law. He began by making use of the necessity of resisting Monmouth to increase his army, under the pretext of the danger of a repetition of the late rebellion; and in the regiments thus levied he appointed many Roman Catholic officers who had refused to comply with the Test Act. Rather than submit to the gentlest remonstrance, he prorogued parliament, and proceeded to obtain from the Court of King's Bench a judgment in favor of his right to dispense with all penalties due by law, in the same way that his grandfather had appealed to the judges in the matter of the post-nati. But not only was the question put by James II. of far wider import than the question put by James I., but he deprived the court to which he applied of all moral authority by previously turning out of office the judges who were likely to disagree with him, and by appointing new ones who were likely to agree with him. A Court of High Commission of doubtful legality was subsequently erected (1686) to deprive or suspend clergymen who made themselves obnoxious to the court, whilst James appointed Roman Catholics to the headship of certain colleges at Oxford. The legal support given him by judges of his own selection was fortified by the military support of an army collected at Hounslow Heath; and a Roman Catholic, the earl of Tyrconnel, was sent as lord-deputy to Ireland (1687) to organize a Roman Catholic army on which the king might fall back if his English forces proved insufficient for his purpose.

James's declaration of indulgence.

Thus fortified, James issued a declaration of indulgence (1687) granting full religious liberty to all his subjects. The belief that the grant of liberty to all religions was only intended to serve as a cloak for the ascendency of one was so strong that the measure roused the opposition of all those who objected to see the king's will substituted for the law, even if they wished to see the Protestant dissenters tolerated. In spite of this opposition, the king thought it possible to obtain a parliamentary sanction for his declaration.

Attempt to summon a packed parliament.

The parliament to which he intended to appeal was, however, to be as different a body from the parliament which met in the first year of his reign as the bench of judges which had approved of the dispensing power had been different from the bench which existed at his accession. A large number of the borough members were in those days returned by the corporations, and the corporations were accordingly changed. But so thoroughly was the spirit of the country roused, that many even of the new corporations were set against James's declaration, and he had therefore to abandon for a time the hope of seeing it accepted even by a packed House of Commons. All, however, that he could do to give it force he did. He ordered the clergy to read it in all pulpits (1688).

Trial of the seven bishops.

Seven bishops who presented a petition asking him to relieve the clergy from the burden of proclaiming what they believed to be illegal were brought to trial for publishing a seditious libel. Their acquittal by a jury was the first serious blow to the system adopted by the king.

Birth of an heir to the throne.

Another event which seemed likely to consolidate his power was in reality the signal of his ruin. The queen bore him a son. There was thus no longer a strong probability that the king would be succeeded at no great distance of time by a Protestant heir. Popular incredulity expressed itself in the assertion that, as James had attempted to gain his ends by means of a packed bench of judges and a packed House of Commons, he had now capped the series of falsifications by the production of a supposititious heir.

Invitation of the Prince of Orange.

The leaders of both parties combined to invite the Prince of Orange to come to the rescue of the religion and laws of England. He landed on November 5 at Brixham. Before he could reach London every class of English society had declared in his favor. James was deserted even by his army. He fled to France, and a convention parliament, summoned without the royal writ, declared that his flight was equivalent to abdication, and offered the crown in joint sovereignty to William and Mary (1689).

Accession of William and Mary.

Results of the Revolution.

The Revolution, as it was called, was more than a mere change of sovereigns. It finally transferred the ultimate decision in the state from the king to parliament. What parliament had been in the 15th century with the House of Lords predominating, that parliament was to be again in the end of the 17th century with the House of Commons predominat-

Predominance of the Commons.

ing. That House of Commons was far from resting on a wide basis of popular suffrage. The county voters were the freeholders; but in the towns, with some important exceptions, the electors were the richer inhabitants who formed the corporations of the boroughs, or a body of select householders more or less under the control of some neighboring landowner. A House so chosen was an aristocratic body, but it was aristocratic in a far wider sense than the House of Lords was aristocratic. The trading and legal classes found their representation there by the side of the great owners of land. The House drew its strength from its position as a true representative of the effective strength of the nation in its social and economical organization.

Such was the body which firmly grasped the control over every branch of the administration. Limiting in the Bill of Rights the powers assumed by the crown, the Commons declared that the king could not keep a standing army in time of peace without consent of parliament; and they made that consent effectual, as far as legislation could go, by passing a Mutiny Act year by year for twelve months only, so as to prevent the crown from exercising military discipline without their authority. Behind these legal contrivances stood the fact that the army was organized in the same way as the nation was organized, being officered by gentlemen who had no desire to overthrow a constitution through which the class from which they sprung controlled the government. Strengthened by the cessation of any fear of military violence, the Commons placed the crown in financial dependence on themselves by granting a large part of the revenue only for a limited term of years, and by putting strictly in force their right of appropriating that revenue to special branches of expenditure.

Causes in favor of liberty.

Such a revolution might have ended in the substitution of the despotism of a class for the despotism of a man. Many causes combined to prevent this result. The landowners, who formed the majority of the House, were not elected directly, as was the case with the nobility of the French States General, by their own class, but by electors who, though generally loyal to them, would have broken off from them if they had attempted to make themselves masters of their fellow-citizens.

Independence of the judges.

No less important was the almost absolute independence of the judges, begun at the beginning of the reign, by the grant of office to them during good behavior instead of during the king's pleasure, and finally secured by the clause in the Act of Settlement in 1701, which protected them against dismissal except on the joint address of both Houses of Parliament.

Liberty of writing and speaking.

Such an improvement, however, finds its full counterpart in another great step already taken. The more representative a government becomes, the more necessary it is for the well-being of the nation that the expression of individual thought should be free in every direction. If it is not so the Government is inclined to proscribe unpopular opinion, and to forget that new opinions by which the greatest benefits are likely to be conferred are certain at first to be entertained by a very few, and are quite certain to be unpopular as soon as they come into collision with the opinions of the majority. In the Middle Ages the benefits of the liberation of thought from state control had been secured by the antagonism between Church and State. The Tudor sovereigns had rightfully asserted the principle that in a well-ordered nation only one supreme power can be allowed to exist; but in so doing they had enslaved religion. It was fortunate that, just at the moment when parliamentary control was established over the state, circumstances should have arisen which made the majority ready to restore to the individual conscience that supremacy over religion which the mediæval ecclesiastics had claimed for the corporation of the universal church. Dissenters had, in the main, stood shoulder to shoulder with churchmen in rejecting the suspicious benefits of James, and both gratitude and policy forbade the thought of replacing them under the heavy yoke which had been imposed on them at the Restoration. The exact mode in which relief should be afforded was still an open question. The idea prevalent with the more liberal minds amongst the clergy was that of comprehension,—that is to say, of so modifying the prayers and ceremonies of the church as to enable the dissenters cheerfully to enter in. The scheme was one which had approved itself to minds of the highest order,—to More, to Bacon, to Hales, and to Jeremy Taylor. It is one which, as long as beliefs are not very divergent, keeps up a sense of brotherhood over-ruling the diversity of opinion. It broke down, as it always will break down in practice, whenever the difference of belief is so strongly felt as to seek earnestly to embody itself in diversity of outward practice. The greater part of the clergy of the church felt that to surrender their accustomed formularies was to surrender somewhat of the belief which those formularies signified, while the dissenting clergy were equally reluctant to adopt the common prayer book even in a modified form.

The Toleration Act.

Hence the Toleration Act, which guaranteed the right of separate assemblies for worship outside the pale of the church, though it embodied the principles of Cromwell and Milton, and not those of Chillingworth and Hales, was carried without difficulty, whilst the proposed scheme of comprehension never had a chance of success (1689).

The choice was one which posterity can heartily approve. However wide the limits of toleration be drawn, there will always be those who will be left outside. By religious liberty those inside gain as much as those who are without. From the moment of the passing of the Toleration Act, no Protestant in England performed any act of worship except by his own free and deliberate choice. The literary spokesman of the new system was Locke. His *Letters concerning Toleration* laid down the principle which had been maintained by Cromwell, with a wider application than was possible in days when the state was in the hands of a mere minority only able to maintain itself in power by constant and suspicious vigilance.

The Test Act retained.

One measure remained to place the dissenters in the position of full membership of the state. The Test Act excluded them from office. But the memory of the high-handed proceedings of Puritan rulers was still too recent to allow Englishmen to run the risk of a reimposition of their yoke, and this feeling, fanciful as it was, was sufficient to keep the Test Act in force for years to come.

Liberty of the press.

The complement of the Toleration Act was the abolition of the censorship of the press (1695). The ideas of the author of the *Areopagitica* had at last prevailed. The attempt to fix certain opinions on the nation which were pleasing to those in power was abandoned by king and parliament alike. The nation, or at least so much of it as cared to read books or pamphlets on political subjects, was acknowledged to be the supreme judge, which must therefore be allowed to listen to what councillors it pleased.

This new position of the nation made itself felt in various ways. It was William's merit that, fond as he was of power, he recognized the fact that he could not rule except so far as he carried the good-will of the nation with him. No doubt he was helped to an intelligent perception of the new situation by the fact that, as a foreigner, he cared far more for carrying on war successfully against France than for influencing the domestic legislation of a country which was not his own, and by the knowledge that the conduct of the struggle which lasted till he was able to treat with France on equal terms at Ryswick (1697) was fairly trusted to his hands. Nevertheless these years of war called for the united action of a national government, and in seeking to gain this support for himself, he hit upon an expedient which opened a new era in constitutional politics.

Beginning of cabinet government.

The supremacy of the House of Commons would have been an evil of no common magnitude, if it had made government impossible. Yet this was precisely what it threatened to do. Sometimes the dominant party in the House pressed with unscrupulous rancor upon its opponents. Sometimes the majority shifted from side to side as the House was influenced by passing gusts of passion or sympathy, so that, as it was said at the time, no man could foretell one day what the House would be pleased to do on the next. Against the first of these dangers William was to a great extent able to guard, by the exercise of his right of dissolution, so as to appeal to the constituencies, which did not always share in the passions of their representatives. But the second danger could not be met in this way. The only cure for waywardness is responsibility, and not only was this precisely what the Commons had not learned to feel, but it was that which it was impossible to make them feel directly. A body composed of several hundred members cannot carry on government with the requisite steadiness of action and clearness of insight. Such work can only fitly be intrusted to a few, and whenever difficult circumstances arise, it is necessary that the action of those few be kept in harmony by the predominance of one. The scheme on which William hit, by the advice of the earl of Sunderland, was that which has since been known as Cabinet government. He selected as his ministers the leading members of the two Houses who had the confidence of the majority of the House of Commons. In this way, the majority felt an interest in supporting the men who embodied their own opinions, and fell in turn under the influence of those who held them with greater prudence or ability than fell to the lot of the average members of the House. All that William doubtless intended was to acquire a ready instrument to enable him to carry on the war with success. In reality he had refounded, on a new basis, the government of England. His own personal qualities were such that he was able to dominate over any set of ministers; but the time would come when there would be a sovereign of inferior powers. Then the body of ministers would step into his place. The old rude arrangements of the Middle Ages had provided by frequent depositions that an inefficient sovereign should cease to rule, and those arrangements had been imitated in the case of Charles I. and James II. Still the claim to rule had, at least from the time of Henry III., been derived from hereditary descent, and the interruption, however frequently it might occur, had been regarded as something abnormal, only to be applied where there was an absolute necessity to prevent the wielder of executive authority from setting at defiance the determined purpose of the nation. After the Revolution, not only had the king's title been so changed as to make him more directly than ever dependent on the nation, but he now called into existence a body which derived its own strength from its conformity with the wishes of the representatives of the nation.

Unruliness of the Commons. For the moment it seemed to be but a temporary expedient. When the war came to an end the Whig party which had sustained William in his struggle with France split up. The dominant feeling of the House of Commons was no longer the desire to support the crown against a foreign enemy, but to make government as cheap as possible, leaving future dangers to the chances of the future. William had not so understood the new invention of a united ministry as binding him to take into his service a united ministry of men whom he regarded as fools and knaves. He allowed the Commons to reduce the army to a skeleton, to question his actions, and to treat him as if he were a cipher. But it was only by slow degrees that he was brought to acknowledge the necessity of choosing his members from amongst the men who had done these things.

The Spanish succession. The time came when he needed again the support of the nation. The death of Charles II., the heirless king of the huge Spanish monarchy, had long been expected. Since the peace of Ryswick, William and Lewis XIV. had come to terms by two successive partition treaties for a division of those vast territories in such a way that the whole of them should not fall into the hands of a near relation either of the king of France or of the emperor, the head of the house of Austria. When the death actually took place in 1700, William seemed to have no authority in England whatever; and Lewis was therefore encouraged to break his engagements, and to accept the whole of the Spanish inheritance for his grandson, who became Philip V. of Spain. William saw clearly that such predominance of France in Europe would lead to the development of pretensions unbearable to other states. But the House of Commons did not see it, even when the Dutch garrisons were driven by French troops out of the posts in the Spanish Netherlands which they had occupied for many years (1701).

The Act of Settlement. William had prudently done all that he could to conciliate the Tory majority. In the preceding year (1700) he had given office to a Tory ministry, and he now (1701) gave his assent to the Act of Settlement, which secured the succession of the crown to the house of Hanover to the exclusion of all Roman Catholic claimants, though it imposed several fresh restrictions on the prerogative. William was indeed wise in keeping his feelings under control. The country sympathized with him more than the Commons did, and when the House imprisoned the gentlemen deputed by the freeholders of Kent to present a petition asking that its loyal addresses might be turned into bills of supply, it simply advertised its weakness to the whole country.

Formation of the Grand Alliance. The reception of this Kentish petition was but a foretaste of the discrepancy between the Commons and the nation, which was to prove the marked feature of the middle of the century now opening. For the present the House was ready to give way. It requested the king to enter into alliance with the Dutch. William went yet further in the direction in which he was urged. He formed an alliance with the emperor as well as with the States General to prevent the union of the crowns of France and Spain, and to compel France to evacuate the Netherlands. An unexpected event came to give him all the strength he needed. James II. died, and Lewis acknowledged his son as the rightful king of England. Englishmen of both parties were stung to indignation by the insult. William dissolved parliament, and the new House of Commons, Tory as it was by a small majority, was eager to support the king. It voted men and money according to his wishes. England was to be the soul of the Grand Alliance against France. But before a blow was struck William was thrown from his horse. He died on March 8, 1702. "The man," as Burke said of him, "was dead, but the Grand Alliance survived in which King William lived and reigned."

Accession of Anne. Upon the accession of Anne, war was at once commenced. The Grand Alliance became, as William would have wished, a league to wrest the whole of the Spanish dominions from Philip, in favor of the Austrian archduke Charles. It found a chief of supreme military and diplomatic genius in the duke of Marlborough. **Marlborough's victories.** His victory at Blenheim (1704) drove the French out of Germany. His victory of Ramillies (1706) drove them out of the Netherlands. In Spain, Gibraltar was captured by Rooke (1704) and Barcelona by Peterborough (1705). Prince Eugene relieved Turin from a French siege, and followed up the blow by driving the besiegers out of Italy.

Occasional Conformity. At home Marlborough, caring nothing for politics, at first gave his support to the Tories, whose church policy was regarded with favor by the queen. Their efforts were directed towards the restriction of the Toleration Act within narrow limits. Many dissenters had evaded the Test Act by partaking of the communion in a church, though they subsequently attended their own chapels. An Occasional Conformity Bill, imposing penalties on those who adopted this practice, twice passed the Commons (1702, 1703), but was rejected by the House of Lords, in which the Whig element predominated. The church was served in a nobler manner in 1704 by the abandonment of first-fruits and tenths by the queen for the purpose of raising the pittances of the poorer clergy. In 1707 a piece of legislation of the highest value was carried to a successful end. **Union with Scotland.** The Act of Union, passed in the parliaments of England and Scotland, joined the legislatures of the two kingdoms and the nations themselves in an indissoluble bond.

United Whig ministry. The ministry in office at the time of the passing of the Act of Union had suffered important changes since the commencement of the reign. The Tories had never been as earnest in the prosecution of the war as the Whigs; and Marlborough, who cared above all things for the prosecution of the war, gradually replaced Tories by Whigs in the ministry. His intention was doubtless to conciliate both parties by admitting them both to a share of power; but the Whigs were determined to have all or none, and in 1708 a purely Whig ministry was formed to support the war as the first purely Whig ministry had supported it in the reign of William. The years of its power were the years of the victories of Oudenarde (1708) and of Malplaquet (1709), bringing with them the entire ruin of the military power of Lewis.

Growing unpopularity of the Whigs. Such successes, if they were not embraced in the spirit of moderation, boded no good to the Whigs. It was known that even before the last battle Lewis had been ready to give up his grandson, and that his offers had been rejected because he would not consent to join the allies in turning him out of Spain. A belief spread in England that Marlborough wished the endless prolongation of the war for his own selfish ends. Spain was far away, and, if the Netherlands were safe, enough had been done for the interests of England. The Whigs were charged with refusing to make peace when an honorable and satisfactory peace was not beyond their reach.

As soon as the demand for a vigorous prosecution of the war relaxed, the Whigs could but rely on their domestic policy, in which they were strongest in the eyes of posterity but weakest in the eyes of contemporaries. It was known that they looked for the principle on which the queen's throne rested to the national act of the Revolution rather than to the birth of the sovereign as the daughter of James II., whilst popular feeling preferred, however inconsistently, to attach itself to some fragment of hereditary right. What was of greater consequence was that it was known that they were the friends of the dissenters, and that their leaders, if they could have had their way, would not only have maintained the Toleration Act, but would also have repealed the Test Act. In 1709 a sermon preached by Dr. Sacheverel denounced toleration and the right of resistance in tones worthy of the first days of the Restoration. Foolish as the sermon was, it was but the reflection of folly which was widely spread amongst the rude and less educated classes. The Whig leaders unwisely took up the challenge and impeached Sacheverel. The Lords condemned the man, but they condemned him to an easy sentence. His trial was the signal for riot. Dissenting chapels were sacked to the cry of High Church and Sacheverel. The queen, who had personal reasons for disliking the Whigs, dismissed them from office (1710), and a Tory House of Commons was elected amidst the excitement to support the Tory ministry of Harley and St. John.

Tory ministry.

Peace of Utrecht.

After some hesitation the new ministry made peace with France, and the treaty of Utrecht, stipulating for the permanent separation of the crowns of France and Spain, and, assigning Milan, Naples, and the Spanish Netherlands to the Austrian claimant, accomplished all that could reasonably be desired, though the abandonment to the vengeance of the Spanish Government of our Catalan allies, and the base desertion of our Continental confederates on the very field of action, brought dishonor on the good name of England. The Commons gladly welcomed the cessation of the war. The approval of the Lords had been secured by the creation of twelve Tory peers. In home politics the new ministry was in danger of being carried away by its more violent supporters. St. John, now Viscount Bolingbroke, with unscrupulous audacity placed himself at their head. The Occasional Conformity Bill was at last carried (1711). To it was added the Schism Act (1714), forbidding dissenters to keep schools or engage in tuition. Bolingbroke went still further. He engaged in an intrigue for bringing over the Pretender to succeed the queen upon her death. This wild conduct alienated the moderate Tories, who, much as they wished to see the throne occupied by the heir of the ancient line, could not bring themselves to consent to its occupation by a Catholic prince, even if his birth marked him out for sovereignty. Such men, therefore, when Anne died (1714) joined the Whigs in proclaiming the elector of Hanover king as George I.

Occasional Conformity Act and the Schism Act.

Accession of the House of Hanover.

The accession of George I. brought with it the predominance of the Whigs. They had on their side the royal power, the greater part of the aristocracy, the dissenters, and the higher trading and commercial classes. The Tories appealed to the dislike of dissenters prevalent amongst the country gentlemen and the country clergy, and to the jealousy felt by the agricultural classes towards those who enriched themselves by trade. Such a feeling, if it was aroused by irritating legislation, might very probably turn to the advantage of the exiled house, especially as the majority of Englishmen were to be found on the Tory side. It was therefore advisable that Government should content itself with as little action as possible, in order to give time for old habits to wear themselves out. The landing of the Pretender in Scotland (1715), and the defeat of a portion of his army which had advanced to Preston,—a defeat which was the consequence of the apathy of his English supporters, and which was followed by the complete suppression of the rebellion,—gave increased strength to the Whig Government. But they were reluctant to face an immediate dissolution, and the Septennial Act was passed (1716) to extend to seven years the duration of parliaments, which had been fixed at three years by the Triennial Act of William and Mary. Under General Stanhope an effort was made to draw legislation in a more liberal direction. The Occasional Conformity Act and the Schism Act were repealed (1719); but the majorities on the side of the Government were unusually small, and Stanhope, who would willingly have repealed the Test Act so far as it related to dissenters, was compelled to abandon the project as entirely impracticable. The Peerage Bill, introduced at the same time to limit the royal power of creating peers, was happily thrown out in the Commons. It was proposed partly from a desire to guard the Lords against such a sudden increase of their numbers as had been forced on them when the treaty of Utrecht was under discussion, and partly to secure the Whigs in office against any change in the royal councils in a succeeding reign. It was in fact conceived by men who valued the immediate victory of their principles more than they trusted to the general good sense of the nation. The Lords were at this time, as a matter of fact, not merely wealthier but wiser than the Commons; and it is no wonder that, in days when the Commons, by passing the Septennial Act, had shown their distrust of their own constituents, the peers should show, by the Peerage Bill, their distrust of that House which was elected by those constituencies. Nevertheless the remedy was worse than the disease. A close oligarchy would not only have held a dominant position for some twenty or thirty years, during which it would really be fit to exercise authority, but would have been impenetrable to the force of public opinion when the time came that a public opinion worthy of the name was formed. It is essential to the permanence of an Upper House that it should be unable to set at defiance the will of the nation expressed by its representatives; and without the power of creation the House of Lords might easily have attempted to do this till there was no alternative to a violent alteration of the constitution.

Repeal of Occasional Conformity Act and Schism Act.

Peerage Bill.

Walpole's ministry.

The excitement following on the bursting of the South Sea Bubble, and the death or ruin of the leading ministers, brought Walpole to the front (1721). As a man of business when men of business were few in the House of Commons, he was eminently fit to manage the affairs of the country. But he owed his long continuance in office especially to his sagacity. He clearly saw, what Stanhope had failed to see, that the mass of the nation was not fitted as yet to interest itself wisely in affairs of government, and that therefore the rule must be kept in the hands of the upper classes. But he was too sensible to adopt the coarse expedient which had commended itself to Stanhope, and he preferred humoring the masses to contradicting them.

Freedom of thought.

The struggle of the preceding century had left its mark in every direction on the national development. Out of the reaction against Puritanism had come a widely-spread relaxation of morals, and also, as far as the educated class was concerned, an eagerness for the discussion of all social and religious problems. The fierce excitement of political life had stirred up the fountains of thought, and the most anciently received doctrines were held of little worth until they were brought to the test of reason. It was a time when the pen was more powerful than the sword, when a secretary of state would treat with condescension a witty pamphleteer, and when such a pamphleteer might hope, not in vain, to become a secretary of state.

Parliamentary corruption.

It was in this world of reason and literature that the Whigs of the Peerage Bill moved. Walpole perceived that there was another world which understood none of these things. With cynical insight he discovered that a great Government cannot rest on a clique, however distinguished. If the mass of the nation was not conscious of political wants, it was conscious of material wants. The merchant needed protection for his trade; the voters gladly welcomed election day as bringing guineas to their pockets. Members of Parliament were ready to sell their votes for places, for pensions, for actual money. The system was not new, as Danby is credited with the discovery that a vote in the House of Commons might be purchased. But with Walpole it reached its height.

General political apathy.

Such a system was possible because the House of Commons was not really accountable to its constituents. The votes of its members were not published, and still less were their speeches made known. Such a silence could only be maintained around the House when there was little interest in its proceedings. The great questions of religion and taxation which had agitated the country under the Stuarts were now fairly settled. To reawaken those questions in any shape would be dangerous. Walpole took good care never to repeat the mistake of the Sacheverel trial. When on one occasion he was led into the proposal of an unpopular excise he at once drew back. England in his days was growing rich. Englishmen were bluff and independent, in their ways often coarse and unmannerly. Their life was the life depicted on the canvas of Hogarth and the pages of Fielding. All high imagination, all devotion to the public weal, seemed laid asleep. But the political instinct was not dead, and it would one day express itself for better ends than an agitation against an excise bill or an outcry for a popular war. A Government could no longer employ its powers for direct oppression. In his own house and in his own conscience, every Englishman, as far as the Government was concerned, was the master of his destiny. By and by the idea would dawn on the nation that anarchy is as productive of evil as tyranny, and that a Government which omits to regulate or control allows the strong to oppress the weak, and the rich to oppress the poor.

Walpole the first prime minister.

Walpole's administration lasted long enough to give room for some feeble expression of this feeling. When George I. was succeeded by George II. (1727), Walpole remained in power. His eagerness for the possession of that power which he desired to use for his country's good, together with the incapacity of two kings born and bred in a foreign country to take a leading part in English affairs, completed the change which had been effected when William for the first time entrusted the conduct of government to a united Cabinet. There was now for the first time a prime minister in England, a person who was himself a subject imposing harmonious action on the Cabinet. The change was so gradually and silently effected that it is difficult to realize its full importance. So far, indeed, as it only came about through the incapacity of the first two kings of the house of Hanover, it might be obliterated, and was in fact to a great extent obliterated, by a more active successor. But so far as it was the result of general tendencies, it could never be obliterated. In the ministries in which Somers and Montagu on the one hand and Harley and St. John on the other had taken part, there was no prime minister except so far as one member of the administration dominated over his colleagues by the force of character and intelligence. In the reign of George III. even North and Addington were universally acknowledged by that title, though they had little claim to the independence of action of a Walpole or a Pitt.

The change was, in fact, one of the most important of those by which the English constitution has been altered from an hereditary monarchy with a parliamentary regulative agency to a parliamentary government with an hereditary regulative agency. In Walpole's time the forms of the constitution had become, in all essential particulars, what they are now. What was wanting was a national force behind them to give them their proper work.

The Opposition.

The growing opposition which finally drove Walpole from power was not entirely without a nobler element than could be furnished by personal rivalry or ignorant distrust of commercial and financial success. It was well that complaints that a great country ought not to be governed by patronage and bribery should be raised, although, as subsequent experience showed, the causes which rendered corruption inevitable were not to be removed by the expulsion of Walpole from office. But for one error, indeed, it is probable that Walpole's rule would have been further prolonged than it was. In 1739 a popular excitement arose for a declaration of war against Spain. Walpole believed that war to be certainly unjust, and likely to be disastrous. He had, however, been so accustomed to give way to popular pressure that he did not perceive the difference between a wise and timely determination to leave a right action undone in the face of insuperable difficulties, and an unwise and cowardly determination to do that which he believed to be wrong and imprudent. If he had now resigned rather than demean himself by acting against his conscience, it is by no means unlikely that he would have been recalled to power before many years were over. As it was, the failures of the war recoiled on his own head, and in 1742 his long ministry came to an end.

War with Spain.

Ministry of Henry Pelham.

After a short interval a successor was found in Henry Pelham. All the ordinary arts of corruption which Walpole had practised were continued, and to them were added arts of corruption which Walpole had disdained to practise. He at least understood that there were certain principles in accordance with which he wished to conduct public affairs, and he had driven colleague after colleague out of office rather than allow them to distract his method of government. Pelham and his brother, the cowardly, intriguing duke of Newcastle, had no principles of government whatever. They offered place to every man of parliamentary skill or influence. There was no opposition, because the ministers never attempted to do anything which would arouse opposition, and because they were ready to do anything called for by any one who had power enough to make himself dangerous; and in 1743 they embarked on a useless war with France in order to please the king, who saw in every commotion on the Continent some danger to his beloved Hanoverian possessions.

At most times in the history of England such a ministry would have been driven from office by the roused outcry of an offended people. In the days of the Pelhams, government was regarded as lying too far outside the all-important private interests of the community to make it worth while to make any effort to rescue it from the degradation into which it had fallen; yet the Pelhams had not been long in power before this serene belief that the country could get on very well without a government in any real sense of the word was put to the test. In 1745 Charles Edward, the son of the Pretender, landed in Scotland. He was followed by many of the Highland clans, always ready to draw the sword against the constituted authorities of the Lowlands; and even in the Lowlands, and especially in Edinburgh, he found adherents, who still felt the sting inflicted by the suppression of the national independence of Scotland. The English army was in as chaotic a condition as its Government, and Charles Edward inflicted a complete defeat on a force which met him at Prestonpans. Before the end of the year the victor, at the head of 5000 men, had advanced to Derby. But he found no support in England, and the mere numbers brought against him compelled him to retreat, to find defeat at Culloden in the following year (1746). The war on the Continent had been waged with indifferent success. The victory of Dettingen (1743) and the glorious defeat of Fontenoy (1745) had achieved no objects worthy of English intervention, and the Peace of Aix-la-Chapelle put an end in 1748 to hostilities which should never have been commenced. The Government pursued its inglorious career as long as Henry Pelham lived. He had at least some share in the financial ability of Walpole, and it was not till he died in 1754 that the real difficulties of a system which was based on the avoidance of difficulties had fairly to be faced.

The young Pretender.

Death of Pelham.

Moral and religious atmosphere.

The change which was needed was not such as was to be expected from any mere re-adjustment of the political machine. Those who cared for religion or morality had forgotten that man was an imaginative and emotional being. Defenders of Christianity and of deism alike appealed to the reason alone. Enthusiasm was treated as a folly or a crime, and earnestness of every kind was branded with the name of enthusiasm. The higher order of minds dwelt with preference upon the beneficent wisdom of the Creator. The lower order of minds treated religion as a kind of life-assurance against the inconvenience of eternal death.

Wesley and Whitefield.

Upon such a system as this human nature was certain to revenge itself. The preaching of Wesley and Whitefield appealed direct to the emotions. They preached the old Puritan doctrine of conversion, and called upon each individual not to understand, or to admire, or to act, but vividly to realize the love and mercy of God. In all this there was nothing new. What was new was that Wesley added an organization, in which each of his followers unfolded to one another the secrets of their heart, and became accountable to his fellows. Large as the numbers of the Wesleyans ultimately became, their influence is not to be measured by their numbers. The double want of the age, the want of spiritual earnestness and the want of organized coherence, would find satisfaction in many ways which would have seemed strange to Wesley, but which were, nevertheless, a continuance of the work which he began.

Ministry of Newcastle.

As far as Government was concerned, when Henry Pelham died (1754) the lowest depth of baseness seemed to have been reached. The duke of Newcastle, who succeeded his brother, looked on the work of corruption with absolute pleasure, and regarded genius and ability as an awkward interruption of that happy arrangement which made men subservient to flattery and money. Whilst he was in the very act of trying to drive from office all men who were possessed of any sort of ideas, he was surprised by a great war. In America the French settlers in Canada and the English settlers on the Atlantic coast were falling to blows for the possession of the vast territories drained by the Ohio and its tributaries. In India, Frenchmen and Englishmen had striven during the last war for authority over the native states round Pondicherry and Madras, and the conflict threatened to break out anew. When war commenced in earnest, and the reality of danger came home to Englishmen by the capture of Minorca (1756), there arose a demand for a more capable Government than any which Newcastle could offer. Terrified by the storm of obloquy which he aroused, he fled from office. A Government was formed, of which the soul was William Pitt. Pitt was, in some sort, to the political life of Englishmen what Wesley was to their religious life. He brought no new political ideas into their minds, but he ruled them by the force of his character and the example of his purity. His weapons were trust and confidence. He appealed to the patriotism of his fellow-countrymen, to their imaginative love for the national greatness, and he did not appeal in vain. He perceived instinctively that a large number, even of those who took greedily the bribes of Walpole and the Pelhams, took them, not because they loved money better than their country, but because they had no conception that their country had any need of them at all. It was a truth, but it was not the whole truth. The great Whig families rallied under Newcastle and drove Pitt from office (1757). But if Pitt could not govern without Newcastle's corruption, neither could Newcastle govern without Pitt's energy. At last a compromise was effected, and Newcastle undertook the work of bribing, whilst Pitt undertook the work of governing.

Ministry of Pitt and Newcastle.

The Seven Years' War.

The war which had already broken out, the Seven Years' War (1756–1763), was not confined to England alone. By the side of the duel between France and England, a war was going on upon the Continent, in which Austria—with its allies, France, Russia, and the German princes—had fallen upon the new kingdom of Prussia and its sovereign Frederick II. England and Prussia, therefore, necessarily formed an alliance. Different as the two Governments were, they were both alike in recognizing, in part at least, the conditions of progress. The generations which have succeeded the generation of Pitt and Frederick have learned gradually the necessity of seeking strength from the embodiment of popular feeling in a representative assembly, and of seeking order from the organization of scientific knowledge. Even in Pitt's day England, however imperfectly, rested its strength on the popular will. Even in Frederick's day Prussia was ruled by administrators selected for their special knowledge. Neither France nor Austria had any conception of the necessity of fulfilling these requirements. Hence the strength of England and of Prussia. The war seems to be a mere struggle for territory. There is no feeling in either Pitt or Frederick, such as there was in the men who contended half a century later against Napoleon, that they were fighting the battles of the civilized world. There is something repulsive as well in the enthusiastic nationality of Pitt as in the cynical nationality of Frederick. Pitt's sole object was to exalt England to a position in which she might fear no rival, and might scarcely look upon a second. But in so doing he exalted that which, in spite of all that had happened, best deserved to be exalted. The habits of individual energy, fused together by the inspiration of patriotism, conquered Canada. The unintelligent over-regulation of the French Government could not maintain the colonies which had been founded in happier times. In 1758 Louisburg was taken, and the mouth of the St. Lawrence guarded against France. In 1759 Quebec fell before Wolfe, who died at the moment of victory. In the same year the naval victories of Lagos and Quibéron Bay established the supremacy of the British at sea. The battle of Plassey (1757) had laid Bengal at the feet of Clive; and Coote's victory at Wandewash (1760) led to the final ruin of the relics of French authority in southern India. When George II. died (1760) England was the first maritime and colonial power in the world.

George III.

In George III. the king once more became an important factor in English politics. From his childhood he had been trained by his mother and his instructors to regard the breaking down of the power of the great families as the task of his life. In this he was walking in the same direction as Pitt was walking. If the two men could have worked together in the same direction, England might have been spared many misfortunes. Unhappily, the king could not understand Pitt's higher qualities, his bold confidence in the popular feeling, and his contempt for corruption and intrigue. And yet the king's authority was indispensable to Pitt, if he was to carry on his conflict against the great families with success. When the war came to an end, as it must come to an end sooner or later, Pitt's special predominance, derived as it was from his power of breathing a martial spirit into the fleets and armies of England, would come to an end too. Only the king, with his hold upon the traditional instincts of loyalty and the force of his still unimpaired prerogative, could, in ordinary times, hold head against the wealthy and influential aristocracy. Unfortunately, George III. was not wise enough to deal with the difficulty in a high-minded fashion. With a well-intentioned but narrow mind, he had nothing in him to strike the imagination of his subjects. He met influence with influence, corruption with corruption, intrigue with intrigue. Unhappily, too, his earliest relations with Pitt involved a dispute on a point on which he was right and Pitt was wrong. In 1761 Pitt resigned office, because neither the king nor the cabinet were willing to declare war against Spain in the midst of the war with France. As the war with Spain was inevitable, and as, when it broke out in the following year (1762), it was followed by triumphs for which Pitt had prepared the way, the prescience of the great war minister appeared to be fully established. But it was his love of war, not his skill in carrying it on, which was really in question. He would be satisfied with nothing short of the absolute ruin of France. He would have given England that dangerous position of supremacy which was gained for France by Lewis XIV. in the 17th century, and by Napoleon in the 19th century. He would have made his country still more haughty and arrogant than it was, till other nations rose against it, as they have three times risen against France, rather than submit to the intolerable yoke. It was a happy thing for England that peace was signed (1763).

Pitt's resignation.

Bute and Grenville.

Even as it was, a spirit of contemptuous disregard of the rights of others had been roused, which would not be easily allayed. The king's premature attempt to secure a prime minister of his own choosing in Lord Bute (1761) came to an end through the minister's incapacity (1763). George Grenville, who followed him, kept the king in leading-strings in reliance upon his parliamentary majority. Something, no doubt, had been accomplished by the incorruptibility of Pitt. The practice of bribing members of parliament by actual presents in money came to an end, though the practice of bribing them by place and pension long continued. The arrogance which Pitt displayed towards foreign nations was displayed by Grenville towards classes of the population of the British dominions. It was enough for him to establish a right. He never put himself in the position of those who were to suffer by its being put in force.

Suppression of contraband trade in America.

The first to suffer from Grenville's conception of his duty were the American colonies. The mercantile system which had sprung up in Spain in the 16th century held that colonies were to be entirely prohibited from trading, except with the mother country. Every European country had adopted this view, and the acquisition of fresh colonial dominions by England, at the peace of 1763, had been made not so much through lust of empire as through love of trade. Of all English colonies, the American were the most populous and important. Their proximity to the Spanish colonies in the West Indies had naturally led to a contraband trade. To this trade Grenville put a stop, as far as lay in his power.

The Stamp Act.

Obnoxious as this measure was in America, the colonists had acknowledged the principle on which it was founded too long to make it easy to resist it. Another step of Grenville's met with more open opposition. Even with all the experience of the century which followed, the relations between a mother country and her colonies are not easy to arrange. If the burden of defence is to be borne in common, it can hardly be left to the mother country to declare war, and to exact the necessary taxation, without the consent of the colonies. If, on the other hand, it is to be borne by the mother country alone, she may well complain that she is left to bear more than her due share of the weight. The latter alternative forced itself upon the attention of Grenville. The British parliament, he held, was the supreme legislature, and, as such, was entitled to raise taxes in America to support the military forces needed for the defence of America. The Act (1765) imposing a stamp tax on the American colonies was the result.

Resistance in America.

As might have been expected, the Americans resisted. For them, the question was precisely that which Hampden had fought out in the case of ship-money. As far as they were concerned, the British parliament had stepped into the position of Charles I. If Grenville had remained in office he would probably have persisted in his resolution. He was driven from his post by the king's resolution no longer to submit to his insolence.

The Rockingham ministry.

A new ministry was formed under the marquis of Rockingham, composed of some of those leaders of the Whig aristocracy who had not followed the Grenville ministry. They were well-intentioned, but weak, and without political ability; and the king regarded them with distrust, only qualified by his abhorrence of the ministry which they superseded.

The Declaratory Act and repeal of Stamp Act.

As soon as the bad news came from America, the ministry was placed between two recommendations. Grenville, on the one hand, advised that the tax should be enforced. Pitt, on the other, declared that the British parliament had absolutely no right to tax America, though he held that it had the right to regulate, or in other words to tax, the commerce of America for the benefit of the British merchant and manufacturer. Between the two the Government took a middle course. It obtained from parliament a total repeal of the Stamp Act, but it also passed a Declaratory Act, claiming for the British parliament the supreme power over the colonies in matters of taxation, as well as in matters of legislation.

Burke's political theory.

It is possible that the course thus adopted was chosen simply because it was a middle course. But it was probably suggested by Edmund Burke, who was then Lord Rockingham's private secretary, but who for some time to come was to furnish thinking to the party to which he attached himself. Burke carried into the world of theory those politics of expediency of which Walpole had been the practical originator. He held that questions of abstract right had no place in politics. It was therefore as absurd to argue with Pitt that England had a right to regulate commerce, as it was to argue with Grenville that England had a right to levy taxes. All that could be said was that it was expedient in a wide-spread empire that the power of final decision should be lodged somewhere, and that it was also expedient not to use that power in such a way as to irritate those whom it was the truest wisdom to conciliate.

Arguments of Pitt and Burke.

The weak side of this view was the weak side of all Burke's political philosophy. Like all great innovators, he was intensely conservative where he was not an advocate of change. With new views on every subject relating to the exercise of power, he shrunk even from entertaining the slightest question relating to the distribution of power. He recommended to the British parliament the most self-denying wisdom, but he could not see that in its relation to the colonies the British parliament was so constituted as to make it entirely unprepared to be either wise or self-denying. It is true that if he had thought out the matter in this direction he would have been led further than he or any other man in England or America was at that time prepared to go. If the British parliament was unfit to legislate for America, and if, as was undoubtedly the case, it was impossible to create a representative body which was fit to legislate, it would follow that the American colonies could only be fairly governed as practically independent states, though they might possibly remain, like the great colonies of our own day, in a position of alliance rather than of dependence. It was because the issues opened led to changes so far greater than the wisest statesman then perceived, that Pitt's solution, logically untenable as it was, was preferable to Burke's. Pitt would have given bad reasons for going a step in the right direction, Burke gave excellent reasons why those who were certain to go wrong should have the power to go right.

Ministry of Lord Chatham.

Scarcely were the measures relating to America passed when the king turned out the ministry. The new ministry was formed by Pitt, who was created Lord Chatham (1766), on the principle of bringing together men who had shaken themselves loose from any of the different Whig cliques. Whatever chance the plan had of succeeding was at an end when Chatham's mind temporarily gave way under stress of disease (1767). Charles Townshend, a brilliant headstrong man, led parliament in the way which had been prepared by the Declaratory Act, and laid duties on tea and other articles of commerce entering the ports of America.

The tea duties.

Home politics.

It was impossible that the position thus claimed by the British parliament towards America should affect America alone. The habit of obtaining money otherwise than by the consent of those who are required to pay it would be certain to make parliament careless of the feelings and interests of that great majority of the population at home which was unrepresented in parliament. The resistance of America to the taxation imposed was therefore not without benefit to the natives of the mother country. Already there were signs of a readiness in parliament to treat even the constituencies with contempt. In 1763, in the days of the Grenville ministry, John Wilkes, a profligate and scurrilous writer, had been arrested on a general warrant,—that is to say, a warrant in which the name of no individual was mentioned,—as the author of an alleged libel on the king, contained in No. 45 of *The North Briton*. He was a member of parliament, and as such was declared by Chief Justice Pratt to be privileged against arrest. In 1768 he was elected member for Middlesex. The House of Commons expelled him. He was again elected, and again expelled. The third time the Commons gave the seat to which Wilkes was a third time chosen to Colonel Lutrell, who was far down in the poll. Wilkes thus became the representative of a great constitutional principle, the principle that the electors have a right to choose their representatives without restriction saving by the regulations of the law.

Wilkes and *The North Briton*.

Middlesex election.

For the present the contention of the American colonists and of the defenders of Wilkes at home was confined within the compass of the law. Yet in both cases it might easily pass beyond that compass, and might rest itself upon an appeal to the duty of Governments to modify the law and to enlarge the basis of their authority, when law and authority have become too narrow.

Lord North and the new Tories.

As regards America, though Townshend died, the Government persisted in his policy. As resistance grew stronger in America, the king urged the use of compulsion. If he had not the wisdom of the country on his side, he had its prejudices. The arrogant spirit of Englishmen made them contemptuous towards the colonists, and the desire to thrust taxation upon others than themselves made the new colonial legislation popular. In 1770 the king made Lord North prime minister. He had won the object on which he had set his heart. A new Tory party had sprung up, not distinguished, like the Tories of Queen Anne's reign, by a special ecclesiastical policy, but by their acceptance of the king's claim to nominate ministers, and so to predominate in the ministry himself.

Divisions in the opposition.

Unhappily the Opposition, united in the desire to conciliate America, was divided on questions of home policy. Chatham would have met the new danger by parliamentary reform, giving increased voting power to the freeholders of the counties. Burke from principle, and his noble patrons mainly from lower motives, were opposed to any such change. As Burke had wished the British Parliament to be supreme over the colonies, in confidence that this supremacy would not be abused, so he wished the great landowning connection resting on the rotten boroughs to rule over the unrepresented people, in confidence that this power would not be abused. Amidst these distractions the king had an easy game to play. He had all the patronage of the Government in his hands, and beyond the circle which was influenced by gifts of patronage he could appeal to the ignorance and self-seeking of the nation, with which, though he knew it not, he was himself in the closest sympathy.

Coercion in America.

The American war.

France supports America.

End of the war.

No wonder resistance grew more vigorous in America. In 1773 the inhabitants of Boston threw ship-loads of tea into the harbor rather than pay the obnoxious duty. In 1774 the Boston Port Bill deprived Boston of its commercial rights, whilst the Massachusetts Government Bill took away from that colony the ordinary political liberties of Englishmen. The first skirmish of the inevitable war was fought at Lexington in 1775. In 1776 the thirteen colonies united in the Congress issued their Declaration of Independence. England put forth all its strength to beat down resistance. She increased her armies by hirelings bought from the German princes. But not only did no military genius appear on the English side, but the distance across the Atlantic was so great, and the immense spaces of even the settled part of the American continent were so large, that it was impossible to effect that conquest which seemed so easy at a distance. The difficulties of the Americans, too, were enormous, but they had the advantage of being at home; and in Washington they found a leader worthy of the great cause for which he fought. In 1777 a British army under Burgoyne capitulated at Saratoga; and in the same year France, eager to revenge the disasters of the Seven Years' War, formed an alliance with the revolted colonies as free and independent states, and was soon joined by Spain. Chatham, who was ready to make any concession to America short of independence, and especially of independence at the dictation of France, died in 1778. The war was continued for some years with varying results; but in 1781 the capitulation of a second British army under Cornwallis at Yorktown was a decisive blow, which brought home to the minds of the dullest the assurance that the conquest of America was an impossibility.

Before this event happened there had been a great change in public feeling in England. The increasing weight of taxation gave rise in 1780 to a great meeting of the freeholders of Yorkshire, which in turn gave the signal for a general agitation for the reduction of unnecessary expense in the government. To this desire Burke gave expression in his bill for economical reform, though he was unable to carry it in the teeth of interested opposition. The movement in favor of economy was necessarily also a movement in favor of peace; and when the surrender of Yorktown was known (1782), Lord North at once resigned office.

The second Rockingham ministry.

The new ministry formed under Lord Rockingham comprised not only his own immediate followers, of whom the most prominent was Charles Fox, but the followers of Chatham, of whom Lord Shelburne was the acknowledged leader. A treaty of peace acknowledging the independence of the United States of America was at once set on foot; and the negotiation with France was rendered easy by the defeat of a French fleet by Rodney, and by the failure of the combined forces of France and Spain to take Gibraltar.

Struggle between Shelburne and Fox.

The coalition.

Already the ministry on which such great hopes had been placed had broken up. Rockingham died in July, 1782. The two sections of which the Government was composed had different aims. The Rockingham section, which now looked up to Fox, rested on aristocratic connection and influence; the Shelburne section was anxious to gain popular support by active reforms, and to gain over the king to their side. Judging by past experience, the combination might well seem hopeless, and honorable men like Fox might easily regard it with suspicion. But Fox's allies took good care that their name should not be associated with the idea of improvement. They pruned Burke's Economical Reform Bill till it left as many abuses as it suppressed; and though the bill prohibited the grant of pensions above £300, they hastily gave away pensions of much larger value to their own friends before the bill had received the royal assent. They also opposed a bill for parliamentary reform brought in by young William Pitt. When the king chose Shelburne as prime minister, they refused to follow him, and put forward the incompetent duke of Portland as their candidate for the office. The struggle was thus renewed on the old ground of the king's right to select his ministers. But while the king now put forward a minister notoriously able and competent to the task, his opponents put forward a man whose only claim to office was the possession of large estates. They forced their way back to power by means as unscrupulous as their claim to it was unjustifiable. They formed a coalition with Lord North, whose politics and character they had denounced for years. The coalition, as soon as the peace with America and France had been signed (1783), drove Shelburne from office. The duke of Portland became the nominal head of the Government, Fox and North its real leaders.

The India Bill.

Such a ministry could not afford to make a single blunder. The king detested it, and the assumption by the Whig houses of a right to nominate the head of the Government without reference to the national interests could never be popular. The blunder was soon committed. Burke, hating wrong and injustice with a bitter hatred, had descried in the government of British India by the East India Company a disgrace to the English name. For many of the actions of that government no honorable man can think of uttering a word of defence. The helpless natives were oppressed and robbed by the Company and its servants in every possible way. Burke drew up a bill, which was adopted by the coalition Government, for taking all authority in India out of the hands of the Company, and even placing the Company's managemant of its own commercial affairs under control. The governing and controlling body was naturally to be a council appointed at home. The question of the nomination of this council at once drew the whole question within the domain of party politics. The whole patronage of India would be in its hands, and, as parliament was then constituted, the balance of parties might be more seriously affected by the distribution of that patronage than it would be now. When, therefore, it was understood that the Government bill meant the council to be named in the bill for four years, or, in other words, to be named by the coalition ministry, it was generally regarded as an unblushing attempt to turn a measure for the good government of India into a measure for securing the ministry in office. The bill of course passed the Commons. When it came before the Lords, it was thrown out in consequence of a message from the king that he would regard any one who voted for it as his enemy.

Pitt's ministry.

The contest had thus become one between the influence of the crown and the influence of the great houses. Constitutional historians, who treat the question as one of merely theoretical politics, leave out of consideration this essential element of the situation, and forget that, if it was wrong for the king to influence the Lords by his message, it was equally wrong for the ministry to acquire for themselves fresh patronage with which to influence the Commons. But there was now, what there had not been in the time of Walpole and the Pelhams, a public opinion ready to throw its weight on one side or the other. The county members still formed the most independent portion of the representation, and there were many possessors of rotten boroughs who were ready to agree with the county members rather than with the great landowners. In choosing Pitt, the young son of Chatham, for his prime minister, as soon as he had dismissed the coalition, George III. gave assurance that he wished his counsels to be directed by integrity and ability. After a struggle of many weeks, parliament was dissolved (1784), and the new House of Commons was prepared to support the king's minister by a large majority.

As far as names go, the change effected placed in office the new Tory party for an almost uninterrupted period of forty-six years. It so happened, however, that after the first eight years of that period had passed by, circumstances occurred which effected so great a change in the composition and character of that party as to render any statement to this effect entirely illusive. During eight years, however, Pitt's ministry was not merely a Tory ministry resting on the choice of the king, but a Liberal ministry resting on national support and upon advanced political knowledge.

Material progress.

The nation which Pitt had behind him was very different from the populace which had assailed Walpole's Excise Bill, or had shouted for Wilkes and liberty. At the beginning of the century the intellect of thoughtful Englishmen had applied itself to speculative problems of religion and philosophy. In the middle of the century it applied itself to practical problems affecting the employment of industry. In 1776 Adam Smith published the *Wealth of Nations.* Already in 1762 the work of Brindley, the Bridgewater canal, the first joint of a network of inland water communication, was opened. In 1767 Hargreaves produced the spinning-jenny; Arkwright's spinning machine was exhibited in 1768; Crompton's mule was finished in 1779; Cartwright hit upon the idea of the power-loom in 1784, though it was not brought into profitable use till 1801. The Staffordshire potteries had been flourishing under Wedgwood since 1763, and the improved steam-engine was brought into shape by Watt in 1768. During these years the duke of Bedford, Coke of Holkham, and Robert Bakewell were busy in the improvement of stock and agriculture.

The increase of wealth and prosperity caused by these changes went far to produce a large class of the population entirely outside the associations of the landowning class, but with sufficient intelligence to appreciate the advantages of a government carried on without regard to the personal interests and rivalries of the aristocracy. The mode in which that increase of wealth was effected was even more decisive on the ultimate destinies of the country. The substitution of the organization of hereditary monarchy for the organization of wealth and station would ultimately have led to evils as great as those which it superseded. It was only tolerable as a stepping-stone to the organization of intelligence. The larger the numbers admitted to influence the affairs of state, the more necessary is it that they respect the powers of intellect. It would be foolish to institute a comparison between an Arkwright or a Crompton and a Locke or a Newton. But it is certain that for one man who could appreciate the importance of the treatise *On the Human Understanding* or the theory of gravitation, there were thousands who could understand the value of the water-frame or the power-loom. The habit of looking with reverence upon mental power was fostered in no slight measure by the industrial development of the second half of the 18th century.

Pitt's India Bill.

His scheme of parliamentary reform. His dealings with Ireland.

The supremacy of intelligence in the political world was, for the time, represented in Pitt. In 1784 he passed an India Bill, which left the commerce and all except the highest patronage of India in the hands of the East India Company, but which erected a department of the home Government named the Board of Control to compel the Company to carry out such political measures as the Government saw fit. A bill for parliamentary reform was, however, thrown out by the opposition of his own supporters in parliament, whilst outside parliament there was no general desire for a change in a system which for the present produced such excellent fruits. Still more excellent was his plan of legislation for Ireland. Irishmen had taken advantage of the weakness of England during the American war to enforce upon the ministry of the day, in 1780 and 1782, an abandonment of all claim on the part of the English Government and the English judges to interfere in any way with Irish affairs. From 1782, therefore, there were two independent legislatures within the British Isles,—the one sitting at Westminster and the other sitting in Dublin. With these political changes Fox professed himself to be content. Pitt, whose mind was open to wider considerations, proposed to throw open commerce to both nations by removing all the restrictions placed on the trade of Ireland with England and with the rest of the world. The opposition of the English parliament was only removed by concessions continuing some important restrictions upon Irish exports, and by giving the English parliament the right of initiation in all measures relating to the regulation of the trade which was to be common to both nations. The Irish parliament took umbrage at the superiority claimed by England, and threw out the measure as an insult, which, even as it stood, was undeniably in favor of Ireland. The lesson of the incompatibility of two co-ordinate legislatures was not thrown away upon Pitt.

Commercial treaty with France.

The Regency Bill.

In 1786 the commercial treaty with France opened that country to English trade, and was the first result of the theories laid down by Adam Smith ten years previously. The first attack upon the horrors of the slave-trade was made in 1788; and in the same year, in the debates on the Regency Bill caused by the king's insanity, Pitt defended against Fox the right of parliament to make provision for the exercise of the powers of the crown when the wearer was permanently or temporarily disabled from exercising his authority.

The king at St. Paul's.

When the king recovered, he went to St. Paul's to return thanks, on the 23d of April, 1789. The enthusiasm with which he was greeted showed how completely he had the nation on his side. All the hopes of liberal reformers were now on his side. All the hopes of moral and religious men were on his side as well. The seed sown by Wesley had grown to be a great tree. A spirit of thoughtfulness in religious matters and of moral energy was growing in the nation, and the king was endeared to his subjects as much by his domestic virtues as by his support of the great minister who acted in his name. The happy prospect was soon to be overclouded. On the 4th of May, eleven days after the appearance of George III. at St. Paul's, the French States General met at Versailles.

The French Revolution.

By the great mass of intelligent Englishmen the change was greeted with enthusiasm. It is seldom that one nation understands the tendencies and difficulties of another; and the mere fact that power was being transferred from an absolute monarch to a representative assembly led superficial observers to imagine that they were witnessing a mere repetition of the victory of the English parliament over the Stuart kings. In fact, that which was passing in France was of a totally different nature from the English struggle of the 17th century. In England, the conflict had been carried on for the purpose of limiting the power of the king. In France, it was begun in order to sweep away an aristocracy in Church and State which had become barbarously oppressive. It was not therefore a conflict touching simply on the political organization of the state. The whole social organization of the country was at stake, and the struggle would be carried on at every point of the territory, and would involve every class of society. In such a conflict, therefore, there was nothing necessarily antagonistic to the maintenance of the most absolute royal power. If there had been a king on the throne who had understood the needs of the times, and who could have placed himself without afterthought at the head of the national movement, he would have been stronger for all good purposes than Lewis XIV. had ever been. Unhappily, it was not in Lewis XVI. to do anything of the kind. Well-intentioned and desirous to effect the good of his people, he was not clear-headed enough to understand how it was to be done, or strong-willed enough to carry out any good resolutions to which he might be brought. The one thing impossible for a king was to be neutral in the great division which was opening in French society; and Lewis was too much a creature of habit to throw off the social ties which united him to the aristocracy. It was the knowledge that the king was in heart on the wrong side that made his continuance to rule impossible. Undoubtedly the best thing that the French could have done, after the king's leanings were known, would have been to dethrone him. But this was not a step which any nation was likely to take in a hurry; and the constitution drawn up by the States General after it passed into the form of the National Assembly was necessarily grounded on suspicion. The one indispensable requisite for the working of a constitution is that it shall be possible to maintain a certain degree of harmony between the various functionaries who are intrusted with the work. Such a harmony was impossible between Lewis and the French nation. Amongst the higher order of minds there might be a desire for liberty, and the word liberty was on the lips of every one. But the thought of liberty was rarely to be found. It was by the passion of equality that the nation was possessed. For the new spirit it was necessary to find new institutions. The old ones had broken down from absolute rottenness, and if they had been other than they were, they were certain to be used on the anti-national side. The force must be given to the nation, not to the aristocracy—not to the king, the ally of the aristocracy. Yet all this had to be done when the mass of the nation was rude and uneducated, ignorant and unversed in political life to the last degree, and when, too, it had been taught by the long course of monarchical government to see force placed above right, and was therefore all the more inclined to solve its difficulties by force. What wonder, therefore, if violence took the place of argument, if mob-rule stepped in to enforce the popular over the unpopular reasoning, and the king soon found that he was practically a prisoner in the hands of his subjects?

English feeling.

In proportion as the French Revolution turned away from the path which English ignorance had marked out for it, Englishmen turned away from it in disgust. As they did not understand the aims of the French Revolutionists, they were unable to make that excuse for even so much of their conduct as admits of excuse. Three men, Fox, Burke, and Pitt, however, represented three varieties of opinion into which the nation was very unequally divided.

View of Fox.

Fox, generous and trustful towards the movements of large masses of men, had very little intellectual grasp of the questions at issue in France. He treated the struggle as one simply for the establishment of free institutions; and when at last the crimes of the leaders became patent to the world, he contented himself with lamenting the unfortunate fact, and fell back on the argument that though England could not sympathize with the French tyrants, there was no reason why she should go to war with them.

of Burke,

Burke, on the other hand, while he failed to understand the full tendency of the Revolution for good as well as for evil, understood it far better than any Englishman of that day understood it. He saw that its main aim was equality, not liberty, and that not only would the French nation be ready, in pursuit of equality, to welcome any tyranny which would serve its purpose, but would be the more prone to acts of tyranny over individuals from the complete remodelling of institutions, with the object of giving immediate effect to the will of the ignorant masses, which was especially liable to be counterfeited by designing and unscrupulous agitators. There is no doubt that in all this Burke was in the right, as he was in his denunciation of the mischief certain to follow when a nation tries to start afresh, and to blot out all past progress in the light of simple reason, which is often most fallible when it believes itself to be most infallible. Where he went wrong was in his ignorance of the special circumstances of the French nation, and his consequent blindness to the fact that the historical method of gradual progress was impossible where institutions had become so utterly bad as they were in France, and that consequently the system of starting afresh, to which he reasonably objected, was to the French a matter not of choice but of necessity. Nor did he see that the passion for equality, like every great passion, justified itself, and that the problem was, not how to obtain liberty in defiance of it, but how so to guide it as to obtain liberty by it and through it.

Burke did not content himself with pointing out speculatively the evils which he foreboded for the French. He perceived clearly that the effect of the new French principles could no more be confined to French territory than the principles of Protestantism in the 16th century could be confined to Saxony. He knew well that the appeal to abstract reason and the hatred of aristocracy would spread over Europe like a flood, and, as he was in the habit of considering whatever was most opposed to the object of his dislike to be wholly excellent, he called for a crusade of all established Governments against the anarchical principles of dissolution which had broken loose in France.

and of Pitt.

Pitt occupied ground apart from either Fox or Burke. He had neither Fox's sympathy for popular movements nor Burke's intellectual appreciation of the immediate tendencies of the Revolution. Hence, whilst he pronounced against any active interference with France, he was an advocate of peace, not because he saw more than Fox or Burke, but because he saw less. He fancied that France would be so totally occupied with its own troubles that it would cease for a long time to be dangerous to other nations. A resolution formed on grounds so hopelessly futile was not likely to stand the test of time.

Coalition against France.

Victories of the republic.

Even if France had been spared the trial of external pressure, it is almost certain that she would have roused resistance by some attempt to maintain her new principles abroad. When the king of Prussia coalesced with the emperor in 1792 to force her to re-establish the royal authority, she broke out into a passion of self-asserting defiance. The king was dethroned, and preparations were made to try him for his life as an accomplice of the invaders. A republic was proclaimed, and in its name innocent persons, whose only crime was to belong to the noble class by birth and feeling, were massacred by hundreds. The grim suspicion which clothed itself with cruelty in the capital became patriotic resistance on the frontier. Before the end of the year the invasion was repulsed, Savoy occupied, the Austrian Netherlands overrun, and the Dutch republic threatened.

Change of feeling in England.

Very few Governments in Europe were so rooted in the affections of their people as to be able to look without terror on the challenge thus thrown out to them. The English Government was one of those very few. No mere despotism was here exercised by the king. No broad impassable line here divided the aristocracy from the people. The work of former generations of Englishmen had been too well done to call for that breach of historical continuity which was a dire necessity in France. There was much need of reform. There was no need of a revolution. The whole of the upper and middle classes, with few exceptions, clung together in a fierce spirit of resistance; and the mass of the lower classes, especially in the country, were too well off to wish for change. The spirit of resistance to revolution quickly developed into a spirit of resistance to reform, and those who continued to advocate changes more or less after the French model were treated as the enemies of mankind. A fierce hatred of France and of all that attached itself to France became the predominating spirit of the nation.

Division of the Whig party.

Such a change in the national mind could not but affect the constitution of the Whig party. The reasoning of Burke would, in itself, have done little to effect its disruption. But the great landowners, who contributed so strong an element in it, composed the very class which had most to fear from the principles of the Revolution. The old questions which had divided them from the king and Pitt in 1783 had dwindled into nothing before the appalling question of the immediate present. They made themselves the leaders of the war party, and they knew that that party comprised almost the whole of the parliamentary classes.

What could Pitt do but surrender? The whole of the intellectual basis of his foreign policy was swept away when it became evident that the Continental war would bring with it an accession of French territory. He did not abandon his opinions. His opinions rather abandoned him. A wider intelligence might have held that, let France gain what territorial aggrandizement it might upon the Continent, it was impossible to resist such changes until the opponents of France had so purified themselves as to obtain a hold upon the moral feelings of mankind. Pitt could not take this view; perhaps no man in his day could be fairly expected to take it. He did not indeed declare war against France; but he sought to set a limit to her conquests in the winter, though he had not sought to set a limit to the conquests of the coalesced sovereigns in the preceding summer. He treated with supercilious contempt the National Convention, which had dethroned the king and proclaimed a republic. Above all, he took up a declaration by the Convention, that they would give help to all peoples struggling for liberty against their respective Governments, as a challenge to England. The horror caused in England by the trial and execution of Louis XVI. completed the estrangement between the two countries, and though the declaration of war came from France (1793), it had been in great part brought about by the bearing of England and its Government.

Pitt and the seceding Whigs.

In appearance the great Whig landowners gave their support to Pitt, and in 1794 some of their leaders, the duke of Portland, Lord Fitzwilliam, and Mr. Wyndham, entered the cabinet to serve under him. In reality it was Pitt who had surrendered. The ministry and the party by which it was supported might call themselves Tory still. But the great

Violence of the Government.

reforming policy of 1784 was entirely at an end. Strong as it was, the Government did not know its own strength. It saw sedition and revolution everywhere. It twisted loose talk into criminal intent. It covered the country with its spies. The slightest attempt to concert measures for obtaining reform were branded as revolutionary violence. Men who would otherwise have been content with declaiming in favor of reform were goaded into actual sedition. The Government sought and obtained additional powers from parliament. Fine, imprisonment, and transportation were dealt out by the law courts in lavish measure. The Reign of Terror in France was answered by a reign of violence in England, modified by the political habits of a nation trained to freedom, but resting on the same spirit of fear and intolerance. In November, 1794, an attempt was made actually to shed blood. Hardy, Horne Tooke, and Thelwall were brought to trial, on a charge of high treason, for issuing invitations to a national convention intended to promote changes of the greatest magnitude in the government. Happily the jury refused to see in this certainly dangerous proceeding a crime worthy of death, and its verdict of Not guilty saved the nation from the disgrace of meting out the extreme penalty of high treason to an attempt to hold a public meeting for the redress of grievances.

The public feeling, in fact, regained its composure sooner than the ministry. The upper and middle classes became conscious of their own strength; and though reform and reformers were as unpopular as ever, the instruments by which reform might be gained hereafter were left untouched for the use of a future generation. The Sedition and Treason Bills, passed in 1795, were limited in their duration, and were never actually put in force.

Pitt as a war minister.

In the mean while, Pitt's management of the war was leading, as far as the Continent was concerned, to failure after failure. Nothing else was possible. He had none of the abilities of a war minister, and his system of sending detached expeditions to various points was not calculated to attain success. Nor is it likely that, even if he had been more competent in this respect, he would have accomplished anything worthy of the efforts which he put forth. It has been said that if he had roused the passions of men, and had proclaimed a holy war upon the Continent, he would have had a better chance of gaining his ends. But passions cannot be artificially excited, and a holy war presupposes a cause which, if it is not holy in itself, will at least be supposed by men to be so. Except under special circumstances, however, it was impossible to rouse enthusiasm against the French republic. Toulon might be succored and abandoned in 1793; La Vendée might have fallacious hopes held out to it in 1794. Frenchmen who were shocked at the habitual employment of the guillotine were yet not inclined to rise at the bidding of a foreign invader against a Government which at all events stood manfully up for the integrity of French territory, whilst the long habit of submission to absolute rule had made the nation slow to take the conduct of affairs into its own hands. The middle classes on the Continent too were on the side of the peasants, and looked to French principles if not to French armies as offering an amelioration of their lot. The Austrian Netherlands, regained from France in 1793, were re-conquered by France in 1794; and a British force under the duke of York did nothing to avert the misfortune. The land was annexed to the territory of the French republic. Early in 1795 the Dutch Netherlands were revolutionized and constituted into a republic in alliance with France. In the same year Prussia made peace with France. Austria continued the contest alone, receiving large sums of money from England, and doing very little in return.

French successes on land.

English successes at sea.

If England could do little for the Continent, she could do enough to insure her own safety. Howe's victory of the 1st of June (1794) inflicted the first of a long series of defeats on the French navy. An attempt in 1795 to support the French royalists by a landing in Quibéron Bay ended in failure, but Ceylon and the Cape of Good Hope were taken from the Dutch. The war, however, had become so expensive, and its results were evidently so small, that there was a growing feeling in England in favor of peace, especially as the Reign of Terror had come to an end in 1794, and a regular Government, the Directory, had been appointed in 1795. Accordingly, in 1796 Lord Malmesbury was sent to France to treat for peace; but the negotiation was at once broken off by his demand that France should abandon the Netherlands.

Hoche's expedition in Bantry Bay.

The French Government, buoyed up by the successes of General Bonaparte, who was driving the Austrians out of Italy, resolved to attempt an invasion of Ireland. In December a French fleet, with Hoche on board, sailed for Bantry Bay. Only part of it arrived there, and retreated without effecting anything. A smaller force, landing in Pembrokeshire, was reduced to surrender.

Victories of St. Vincent and Camperdown.

The French attempted to renew the enterprise in the following year. Spain was now in alliance with France, and it was proposed that a Spanish fleet should join the French fleet and the Dutch fleet for a joint invasion. Jervis defeated the Spanish fleet at St. Vincent, and Duncan defeated the Dutch fleet at Camperdown (1797). During the same year a mutiny in the fleet at Spithead and St. Helens was quieted by concessions to the reasonable complaints of the sailors; whilst an unreasonable mutiny at the Nore was suppressed by firmness in resistance. A renewed attempt to negotiate peace at Lille had ended in failure, because, though the English were this time ready to abandon the Netherlands to France, they were not ready to give back the Cape of Good Hope to the Dutch and Trinidad to Spain. Before the end of the year England had no ally in Europe excepting Portugal. Bonaparte had dictated to Austria the treaty of Campo Formio.

Mutiny in the fleet.

England without allies.

Isolated as Great Britain was, there was less inclination to make peace in England in 1798 than there had been in 1795. In proportion as France fell into the hands of the less violent but more corrupt of the Revolutionists, the enthusiasm which her proclamation of principles had once created amongst the class excluded from political power died away; whilst the antagonism aroused by mere military conquest under the conduct of the rapacious Bonaparte was on the increase. The attempt at invasion had roused the national spirit to stubborn resistance; whilst the Government itself, warned by the failure of the proceedings against Hardy and his associates, and freed from the blind terror which had made it violent during the first years of the war, was able to devote its energies unreservedly to carrying on hostilities.

State of Ireland.

If, however, a French invasion had ever been anything more than a dream, it was because there was one quarter in which misgovernment had created a state of circumstances by which it was absolutely invited. At the end of 1794 Lord Fitzwilliam had been sent to Ireland as lord-lieutenant, and had set his face against the vile jobbery through which the leaders of the Protestant minority governed Ireland, and had thrown himself warmly into the encouragement of Grattan's scheme for the admission of the Catholics to political power. The aggrieved jobbers gained the ear of the king, and in 1795 Fitzwilliam was recalled. Then ensued a scene which has no parallel even in the organized massacres of the French Republic. The Catholics joined in a society called the United Irishmen, to enforce their claims, if need be, by an alliance with France, and the establishment of an independent republic. Deeds of violence preluded any actual attempt at insurrection. The Protestants, under the name of Orangemen, gathered to the support of the Government as yeomanry or militiamen. Before long these guardians of the peace had spread terror over all Catholic Ireland. By the lash, by torture, by the defilement of chaste and innocent women, they made their predominance felt. It was in 1796, in the very midst of these abominable horrors, that French ships had appeared but had been unable to land troops in Bantry Bay. Nevertheless, though no assistance was to be had, the United Irishmen rose in rebellion in 1798. The rebellion was suppressed, and again the militiamen and volunteers were let loose to establish order by massacre and violence. Fortunately, the English Government intervened, and a new lord-lieutenant, the marquis of Cornwallis, was sent over to Dublin. The raging Protestant aristocracy was held back from further deeds of cruelty and vengeance, and law and order were established so far as it was possible to establish them in a land so torn by hostile factions.

The Irish rebellion.

Pitt rose to the occasion. He planned a great scheme of

The Union.

Pitt's resignation.

union between the two nations (1799). There was to be one parliament for Great Britain and Ireland, as there was one parliament for England and Scotland. The jobbers who filled the seats in the Irish House of Commons, and who voted in the name of a people whom they in no sense represented, joined the few members who from a sense of patriotism refused to vote away so easy a source of wealth and influence. Pitt bought the votes which he could not command, and the Irish parliament, on these ignoble terms, consented to extinguish itself (1800). It depended on the English Government whether this change, by which Ireland lost the semblance of national independence, should be followed by a step in advance for that country in a serious attempt to diminish the evils of Protestant supremacy. That step Pitt had pledged himself to take, and in 1801 he had prepared a measure for admitting the Catholics to political power. The king stood in the way, and Pitt resigned office rather than forfeit his word.

Battle of the Nile.

The second coalition.

Claim to the right of search.

The year which witnessed Pitt's failure in domestic legislation also witnessed his failure in military effort. In 1798 Bonaparte sailed for Egypt with the intention of setting up a French dominion in the East. The fleet which conveyed him was annihilated after his landing by Nelson at the battle of the Nile. Pitt seized the opportunity of the great general's absence from Europe to organize a second coalition against France. In the campaign of 1799 Italy was regained from France, and in the East Bonaparte was driven back from Acre by the Turks headed by Sir Sidney Smith. The news of French disasters brought him hurriedly back to Europe, but before he could take part in the war Massena had defeated the coalition at Zurich. A *coup d'état*, however, placed Bonaparte, under the name of first consul, in practical possession of absolute power; and in the following year his great victory at Marengo (1801), followed up by Moreau's victory of Hohenlinden, enabled him to dictate as a conqueror the treaty of Lunéville, by which France entered once more into possession of the frontier of the Rhine. By this treaty not only was England again isolated, but she found herself exposed to new enemies. Her enforcement of the right of search to enable her ships to take enemies' goods out of neutral vessels exasperated even friendly powers, and Russia was joined by Sweden and Denmark to enforce resistance to the claim. It was under these circumstances that Pitt's resignation was announced.

Addington's ministry.

The peace of Amiens.

The successor of the great minister was Addington, whose mind was imbued with all the Protestant prejudices of the king, which were, it must be owned, the Protestant prejudices of the nation. He had neither force of character nor strength of intellect. Nelson's victory at Copenhagen, which crushed the naval power of Denmark and broke up the Northern Alliance, and the landing of Abercromby in Aboukir Bay, followed by the victory of Alexandria and the consequent evacuation of Egypt by the French, were events prepared by the former administration. Addington's real work was the peace of Amiens (1802), an experimental peace, as the king called it, to see if the first consul could be contented to restrain himself within the very wide limits by which his authority in Europe was still circumscribed.

In a few months England was made aware that the experiment would not succeed. Interference and annexation became the standing policy of the new French Government. England, discovering how little intention Bonaparte had of carrying out the spirit of the treaty, refused to abandon Malta, as she had engaged to do by the terms of peace.

Renewal of the war.

The war began again, no longer a war against certain principles, and the extension of dominion resulting from the victory of those principles, but against aggressive despotism, wielding military force, conducted by consummate military genius, and setting at naught the rights of populations as well as the claims of rulers. This time the English nation was all but unanimous in resistance. This time its resistance would be sooner or later supported by all that was healthy in Europe.

Pitt's second ministry.

The spirit of England was fully roused by the news that Bonaparte was preparing invasion. Volunteers were enrolled in defence of the country. There was a general belief that the prime minister was not equal to the crisis. Addington retired, and Pitt again became prime minister (1804). He would gladly have joined Fox in forming an administration on a broader basis than his former one. But the king objected to Fox, and some of Pitt's old friends refused to desert the proscribed statesman. Pitt became the head of a ministry of which he was the only efficient member.

Trafalgar and Austerlitz.

England was strong enough to hold her own against Bonaparte, who was now Napoleon, emperor of the French (1805). Nelson crushed the combined French and Spanish fleets at Trafalgar, paying with his own life for a victory which put an end to the French naval power for the remainder of the war. The iron of Napoleon's tyranny had not yet entered into the Continental nations sufficiently to rouse them to a truly popular resistance. A third coalition ended in as complete a disaster as that in which the first and second had ended. Austria lost a large part of her force in the capitulation of Ulm, and the Austrian and Russian armies were overpowed at Austerlitz. To effect these victories the force which threatened the invasion of England would necessarily have been withdrawn, even if the result of the battle of Trafalgar had not made the enterprise hopeless. Pitt died shortly after receiving the news of the disasters of his allies (1806).

Ministry of All the Talents.

Pitt's death forced the king to accept a ministry of which Fox was a member. This ministry of All the Talents, as it was called, was not successful in the conduct of the war. Its year of office was the year in which Prussia was crushed at Jena, and it dissipated the strength of the English army in unimportant distant expeditions, instead of throwing it upon one spot to aid Prussia or Russia. Its great title to fame is the abolition of the slave trade. Fox's death deprived the ministry of its strongest member, and in the following year an attempt on its part to admit Roman Catholics to the naval and military service of the crown drew from the king a demand for an engagement never to propose any concession to the Catholics. They refused to make any such promise, and were summarily ejected from office. The king's firm stand was popular in England. The reaction against the French Revolution no longer demanded the infliction of penalties upon those who promulgated its doctrines; but a spirit had been produced which was inexorable against all attempts to effect any change for the better. A spirit of blind, unreasoning conservatism had taken the place of the enlightened Toryism of Pitt's earlier days.

Ministry of the Duke of Portland.

Commercial struggle with France.

The new ministry (1807), under the nominal leadership of the duke of Portland, had to face Napoleon alone. The battle of Friedland and the peace of Tilsit left him master of the greater part of the Continent. Prussia and Austria were already stripped of territory; and as protector of the Confederation of the Rhine, Napoleon ruled in Germany. Italy was directly subjected to his power. Unable to make war upon England by his fleets and armies, he attempted to subdue her by ruining her commerce. By the Berlin decree (1807), he declared the whole of the British islands to be in a state of blockade, though he had not a single ship at sea to enforce his declaration. He declared all British manufactured goods prohibited wherever his power reached, and excluded from his dominions even neutral ships which had touched at a British port. The British Government, instead of leaving Napoleon to bear the odium of this attack on neutral commerce, retaliated by Orders in Council conceived in the spirit of his own measure. They declared that all vessels trading with France were liable to seizure, and that all such vessels clearing from a hostile port must touch at a British port to pay customs duties. Napoleon answered by the Milan decree, forbidding neutrals to trade in any article imported from any part of the British dominions. The Orders in Council cost England a war with America. The Berlin and Milan decrees contributed largely to the overthrow of Napoleon's power. Every poor man who was debarred from the means of providing sugar or cloth for his family felt the grievance. The French Republic had declared war against the nobles and the higher classes; Napoleon decreed an oppression which was bitterly felt in every cottage.

The Peninsular war.

In pursuit of his design of forcing the Continental system, as he termed it, on Portugal, Napoleon sent Junot to occupy Lisbon, and dethroned the king in 1807. In 1808 he seized on the royal family of Spain, and offered the crown to his brother Joseph. When the Spaniards resisted, the English Government sent troops to the Peninsula. Defeated at Vimeira, Junot was allowed to evacuate Portugal. Napoleon came to the rescue of his lieutenants in Spain, and though he retired without effecting the expulsion of the English, Sir John Moore was slain at Corunna (1809) after inflicting a repulse on the French, and his army was shipped for England. In the summer Wellesley landed in Portugal. Thanks to a fresh aggressive war of Napoleon against Austria, he was able to make his footing sure, though the English ministry sent large forces to perish in the marshes of Walcheren, which might have been better employed in supporting Wellesley at the time when he was driven to retreat before superior numbers after the fruitless victory of Talavera.

In 1810 Wellesley, now known under the name of Wellington, beat back the masses of the French forces under Massena from behind the lines of Torres Vedras. Wellington's resistance was great as a military exploit. But it was far more than a military exploit. It would have been of little avail to linger, however safely, in a corner of Portugal unless he were sure of better allies than the wretched Spanish soldiers who had looked on whilst he fought for them at Talavera. Wellington saw clearly that there is no ally so strong as the arrogance and injustice of an enemy. His firm hope was that Napoleon would ruin himself, and his hope did not deceive him. In 1812 Napoleon wrecked his finest army on the snows of Russia. Wellington had breathing space to issue forth from Portugal, to seize the frontier fortresses of Ciudad Rodrigo and Badajoz, and to win the battle of Salamanca. In 1813 Germany rose against its oppressor. The victory of Leipsic drove the despot over the Rhine, and the victory of Vittoria drove his lieutenants over the Pyrenees. The peoples of Europe were against him. In 1814 he was driven into exile at Elba. Wellington's last victory in this war was won at Toulouse after the abdication of the emperor. In 1815 the emperor returned and seized the throne once more. England and Prussia were the first in the field, and the crushing blow at Waterloo consigned him to a lifelong exile at St. Helena.

Battle of Waterloo.

American war.

The war with America, begun in 1812, had been caused by the pressure of the English naval force on neutral commerce under the Orders in Council, which the British Government refused to withdraw till it was too late, and by its claim to impress British seamen when serving on board American ships. The war was brought to an end by the treaty of Ghent (1814).

First years of peace.

After a long war the difficulties of the victors are often greater than those of the conquered. The conquered have their attention directed to the reparation of losses, and are inspired by a patriotic desire to submit to sacrifices for the sake of their country. The victors are in the frame of mind which expects everything to be easy, and they have been accustomed to direct their energies to the business of overpowering foreign enemies, and to hide their eyes from the constant watchfulness required by the needs of the population at home. The war out of which England had come was more than ever calculated to foster this tendency to domestic inaction. To the governing classes despotism, revolution, and reform were almost synonymous. Ministries had succeeded one another: Perceval followed Portland in 1809, and Liverpool followed Perceval in 1812. They were all alike in abhorrence of the very idea of change, in the entire abandonment of those principles of active and intelligent government by which Pitt, whose followers they professed to be, had been always inspired. The supremacy of the proprietors of land, and absolute resistance to reform, were accepted as the rule of government. It made no difference that the king had become permanently insane in 1810, and that the base and sensual prince of Wales became regent in 1811, till he ascended the throne in 1820 as George IV.

Strife of classes.

The wrongs of the propertied classes could make themselves heard. In 1815 a corn law had been passed prohibiting the import of corn till the price was above 80s. a quarter. In 1816 the ministry were compelled to submit to the repeal of the property tax, and abandoned the malt tax without pressure. In the mean while the agricultural and industrial poor were on the verge of starvation. It would be absurd to draw too close a comparison between the position of the English upper classes at this time and of the French upper classes before the Revolution. But there was the same tendency to use political power as a support for their own material interests, the same neglect of the wants and feelings of those who had none to help them. Those in authority were naturally startled when, at a time when mobs driven to desperation were breaking machines and burning ricks, Cobbett in his *Weekly Political Register* was advocating universal suffrage and annual parliaments. The revolution struck down in France appeared to be at the doors in England.

Demand for parliamentary reform.

In great part, no doubt, the misery was brought about by causes over which no Government could have had any control,—by the breaking up of the irregular channels through which commerce had flowed during the war. But it was in great part, too, owing to the incidence of the protective system to which the Government, widely departing from the track marked out by the early steps of Pitt, was giving effect with the full support of the manufacturing as well as the landowning class.

Repressive measures.

A riot in London (1816), and a missile thrown at the carriage of the prince regent, roused in parliament something like the repressive violence of 1794. Even the brilliant Canning, the ablest of the disciples of Pitt, declaimed against the parliamentary reform which was now asked for in so many quarters. Acts, of which the suspension of the Habeas Corpus Act was the most severe, were passed to strengthen the hands of the ministry. Seditious meetings, mingled with real or imaginary projects of insurrection, kept the alarm of the upper classes on the stretch. But, as in 1794, juries were suspicious of evidence furnished by spies, and refused to convict on insufficient proof.

The strife between classes culminated in 1819. Large meetings in the open air were held in the great towns, and inflammatory speeches were freely addressed to them. Some of the speakers were arrested. At Stockport the constable in charge of one of the prisoners was attacked and shot. Birmingham, a great unrepresented town, elected a "legislatorial attorney." A large meeting was summoned at Manchester, another great unrepresented town, to follow the example. The meeting was declared by the magistrates to be illegal, and another meeting was accordingly summoned for the undoubtedly legal purpose of petitioning for parliamentary reform. On the appointed day thousands poured in from the surrounding districts. These men had been previously drilled, for the purpose, as their own leaders asserted, of enabling them to preserve order,—for the purpose, as the magistrates suspected, of preparing them to take part in an armed insurrection. A fruitless attempt by the magistrates to arrest a popular agitator named Hunt as he was preparing to address the crowd was followed up by a charge of cavalry. Six persons were killed, and a far larger number were wounded in the onslaught. The Manchester massacre divided the kingdom into opposite camps. The use of military violence roused a feeling which struck a chord of old English feeling inherited from the days when Oliver's dragoons had made themselves hated. Large meetings were held to protest, and were addressed by men who had but little sympathy with the previous agitation. Parliament replied by enacting new laws, known as the Six Acts, in restraint of sedition, by sharpening the powers of the administrators of justice. The Government took up the same antagonistic position against the right of Englishmen to meet for political purposes which had been taken up in the days of the Reign of Terror. But the very fact that there was no reign of terror on the other side of the Channel weakened its hands. The intelligence of the country was no longer on their side. Lord Sidmouth, the Addington who had made so inefficient a prime minister, was not the man to gain support as home secretary for a policy of severity which was only the disguise of weakness; and Lord Castlereagh, to whom was intrusted the management of foreign affairs, had disgusted all generous minds by his sympathy with despotic rule upon the Continent.

The Manchester massacre.

The Six Acts.

George IV. and Queen Caroline.

Soon after George IV. became king, on the death of his father in 1820, the alienation of the people from the Government was marked by the indignation aroused by the attempts of ministers to pass a Bill of Pains and Penalties depriving the new queen of her rights as the wife of the sovereign on the ground of the alleged immorality of her conduct. Even those who suspected or believed that her conduct had not been blameness, were shocked at an attempt made by a king whose own life was one of notorious profligacy, and whose conduct towards his wife had been cruel and unfeeling, to gain his own ends at the expense of one whom he had expelled from his home and had exposed to every form of temptation. The failure of the ministers to carry the Bill of Pains and Penalties was a turning-point in the history of the country. The existing system lost its hold on the moral feelings as well as on the intelligence of the nation. For some time to come, sympathy with parliamentary reform would be confined to the ranks of the Opposition. But in 1822 the death of Lord Castlereagh, who had recently become Lord Londonderry, and the retirement of Lord Sidmouth, placed Canning in the secretaryship for foreign affairs and Peel at the home office.

Canning's foreign policy.

Canning carried the foreign policy of the country in a new direction. The desire for peace had led the ministry to support the Holy Alliance, a league formed between the absolute sovereigns of the Continent for the suppression in common of all popular movements. Canning broke loose from these old traditions. He made himself loved or hated by offering, without purpose of aggression or aggrandizement, aid or countenance to nations threatened by the great despotic monarchies; and he thus to some extent placed limits on the power of the military despotisms of Europe. Far more cautious and conservative than Canning, Peel took up the work which had been begun by Romilly, and put an end to the barbarous infliction of the penalty of death for slight offences. After Canning's short ministry, followed by his death (1827), Peel, after consenting to the abolition of the Test and Corporation Acts, passed a bill, in conjunction with the new prime minister the duke of Wellington, to admit Catholics to a seat in parliament, thus carrying out Pitt's great plan, though sadly late. From 1823 to 1828 Huskisson, as president of the Board of Trade, had been at work loosening the bonds of commercial restriction, and thus carrying out Pitt's policy in another direction.

Domestic policy of Peel and Huskisson.

Such changes, however, were only an instalment of those which were demanded by the now ripened public opinion of the country; and as the ministers had not been the initiators of the late concessions to Catholics and dissenters, they failed to obtain any enthusiastic support from reformers; whilst the fact that the concessions had been made alienated the opponents of reform. On the death of George IV. and the accession of William IV. (1830), a new ministry, a combination of Whigs and Canningites, came into office under Lord Grey.

Lord Grey's ministry.

The Reform Act.

After a struggle lasting over more than a year, parliamentary reform was carried in the teeth of the opposition of the House of Lords. The franchise was so arranged as to give a very large share of influence to the middle classes of the towns. But though the landowning aristocracy was no longer supreme, it was by no means thrown on the ground. Lords and gentlemen of large estate and ancient lineage had taken the lead in the reforming cabinet, and the class which had the advantages of leisure and position on its side would have no difficulty in leading, as soon as it abandoned the attempt to stand alone. Fortunately, too, at the time when the institutions of our country were refounded on a broader basis, science had long taken a form which impressed the minds of the people with a reverence for knowledge. Mechanical invention, which had accomplished such wonders in the middle of the 18th century, entered upon a fresh period of development when the first passenger railway train was dragged by a locomotive in 1830. Mental power applied to the perfecting of manufacture is not in itself higher than mental power applied in other directions, but it is more easily understood and more readily respected. Experience taught large masses of men to submit to the guidance of those who knew what they did not know. Amongst statesmen, too, the shock to the old order produced an open mind for the reception of new ideas, and the necessity of basing authority on a wider foundation produced a desire for the spread of education, and gave rise to a popular literature which aimed at interpreting to the multitude the thoughts by which their conduct might be influenced.

Legislation by the reformed parliament.

The first great act of the reformed parliament bore the impress of the higher mind of the nation. The abolition of slavery (1833) in all British colonies did credit to its heart; the new poor-law (1834) did credit to its understanding. An attempt to strip the Irish established church of some of its revenues broke up the ministry. There were differences amongst the members of the Government, and those differences were echoed in the country. The king was frightened at the number of changes demanded, dismissed his ministers, and intrusted the formation of a new Government to Sir Robert Peel. The new Government abandoned the title of Tory for the title of Conservative.

Peel's first ministry.

It was the last time that the sovereign actively interfered in the change of a ministry. The habits of parliament had been much changed since the days of the Regency Bill of 1788, when it was acknowledged by all that a change of ministry would follow the announcement of the accession of the Prince of Wales to power, without any corresponding change in the political temper of parliament. Sinecure appointments had recently been lopped away with an unsparing hand, and the power of corrupting members of parliament had been taken away. The character of the members themselves had risen. They were more deeply interested in political causes themselves, and were too clearly brought under the full light of publicity to make it possible for them to become amenable to those evil influences to which their fathers had succumbed.

The Melbourne ministry.

The new minister dissolved parliament. The increase to the numbers of his followers showed that the country had to some extent taken alarm. But he could not command a majority, and he resigned office in favor of Lord Melbourne (1835). The Melbourne ministry signalized its accession to office by the reform of the municipal corporations. Then came the lowering of the stamp duty on newspapers and the Tithe Commutation Act (1836), benefiting the landholders and the clergy alike. The foundation was laid of many a beneficial change.

Chartism.

The accession of Queen Victoria (1837) did not cut short the tenure of power of the ministry. But the condition of the manufacturing poor was deplorable, and it gave rise to the Chartist agitation for admission to equal political rights with the middle classes. A large body of Chartists threatened an appeal to physical force, and the terror produced by these threats swelled the tide of Conservative reaction. The ministry suffered too from a lack of financial ability. They were bold enough where they saw their way. The introduction of the penny postage (1840) was a daring step in the face of embarrassed finances, though it might be supported by the success of the lowering of the newspaper stamp duty in 1836. In 1841 ministers produced free-trade measures as the best remedy for existing evils. But they were already discredited by past ill success in the management of the exchequer, and the hostile majority in the new parliament which carried Peel to power was the expression as much of want of confidence in their ability as of dislike of their measures.

Fall of the Whig Government.

Peel's second ministry.

The Conservative ministry followed in the steps of its predecessors. An income-tax was once more laid on (1842) to enable the prime minister to reduce the duties on imports. With respect to corn, he imposed a sliding scale of duties, which shut out foreign corn in seasons of low prices, and allowed it to come in in seasons of high prices. Outside parliament a great association, the Anti-Corn-Law League, with Richard Cobden as its principal spokesman, poured forth unanswerable arguments on behalf of the entire freedom from duty of imported food. It was a fortunate circumstance that the free-trade doctrines won their way by degrees. Victories are not won by reason alone, and it is no wonder that after a parliament in which the landowners were more than usually strong had deprived the manufacturers of protection, the manufacturers discovered that the arguments which had been found good in their case would also hold good in the case of the landowners, especially after they had learnt from their own experience that prosperity was likely to result from the change. At last Sir Robert Peel, shaken by argument and moved by the difficulty of providing for an Irish famine, proposed and carried the repeal of the corn duties (1846).

Free trade.

Peel's resolution broke up his party, and made his retirement from office inevitable. Lord John Russell, who succeeded him, completed the system which Peel had established. The markets were thrown open to foreign as well as to colonial sugar (1846), and the repeal of the navigation laws (1847) enabled the merchant to employ foreign ships and seamen in the conveyance of his goods; and after the short ministry of Lord Derby (1852), another sweeping abolition of duties was carried by Mr. Gladstone as chancellor of the exchequer in the ministry of Lord Aberdeen (1853.)

Tendencies of the age.

The changes in the direction of free trade were accompanied by a large number of other changes which have left their mark on the statute-book and on the habits of the people. There is no mistaking the tendency of this great era of legislation under the influence of the reform by which the balance of power had swayed over to the middle classes in 1832. The idea which was steadily making its way was the idea of testing all questions by the interest of the nation as a whole, and of disregarding in comparison the special interests of particular classes. It was this idea which lay at the root of the scientific doctrine on which the free traders founded their practice, and which commended that practice to imaginations as well as to the desires of the mass of the population.

This combination of thought with popular movement towards equality was but one of the manifestations of that greater movement which had been passing over Europe ever since the beginning of the French Revolution. It was assisted by the character of the material progress of the time. When the soil of the country was covered with a network of railways, when the electric telegraph began to come into use, and all parts of the country were brought into closer connection with one another, when the circulation of books and newspapers became more easy and more rapid, the sense of unity grew stronger with the growth of the means of communication. Nor was it only the sense of the unity of the various parts of the country which was growing. Class drew nearer to class, and the wants, the desires, and the prejudices of each were better understood than they had formerly been. Slowly but surely the influence of education spread. The duty of legislating for the benefit of the weak and the poor was better understood, tempered by an increasing understanding of the evils of interference with liberty of action. In the midst of the tendency to equality, the old English belief in the virtue of liberty was strengthened by the knowledge imparted by a more scientific conception of human nature.

Further reform proposed.

It was impossible that this change should pass over the national mind without giving rise to a desire to include the working class in that body of electors in whose hands political power was ultimately placed. Before the end of Lord John Russell's ministry, a new Reform Bill had been introduced by the Government (1852), but it did not pass into law. Soon after Lord Aberdeen's accession to office the mind of the nation was too completely taken up with foreign affairs to attend to organic changes at home. The attack upon Turkey by the emperor of Russia was resisted by the allied forces of England and France. England was jealous of Russian advancement in the East; and in the hands of the emperor Nicholas the government of Russia was a military despotism so brutal, and was so heavily laid in the scale in opposition to all liberal progress on the Continent, that England and France might well have been regarded as fighting the battle of Europe as well as contending in their own cause. The invasion of the Crimea and the victory of the Alma were followed by the siege of Sebastopol and the successful defence of the heights above Inkerman (1854). Inexperience in war left the English army especially exposed to hardships in the winter; and when operations were resumed in the summer, it was far outnumbered by its French allies, who consequently gained the greater part of the credit of the capture of Sebastopol (1855). In the following winter mistakes had been corrected, and the condition of the English army was worthy of the nation which sent it forth. The peace which was signed at Paris (1856) deprived it of the opportunity of showing its powers. The terms, so far as they imposed restrictions upon Russia, have not proved of any permanent value; and the idea which then prevailed that the Turks were likely to advance in the course of political and social improvement was without any corresponding basis in the region of facts. It was quite right that the settlement of the unhappy regions commonly known as Turkey in Europe should be taken up as European rather than a Russian duty, but it is a duty the distractions or jealousies of European powers left unfulfilled, till Russia at last stepped forward to repair their omissions. The indirect results of the Crimean war are to be found in the removal of the pressure with which Russia had weighed on the nations of the Continent; and it may perhaps be fairly argued that the subsequent happy formation of a united Italy and a united Germany were in part rendered possible by the success of England and France under the walls of Sebastopol.

The Crimean war.

The Indian mutiny.

For some time after the Crimean war the business of legislation proceeded without any very great shocks. The suppression of a vast military rebellion in India (1857) was followed by the assumption of the direct authority over India by the crown. Though one or two attempts were made to effect an electoral reform, they were wrecked on the apathy or hostility of the nation, and there was general acquiescence in the course pursued by Lord Palmerston's ministry (1859), which, after one half-hearted attempt, refused to proceed further with the measure which it had proposed; whilst a succession of financial improvements were carried out by Mr. Gladstone, his chancellor of the exchequer. On Lord Palmerston's death (1865), the new Government, with Earl Russell at its head and Mr. Gladstone as the leader of the House of Commons, proposed a measure of reform, and resigned on failing to carry it (1866). Lord Derby succeeded, and Mr. Disraeli introduced an elaborate and complicated measure in the House of Commons. By this time the feeling of the working class had risen, and the necessary impulse was thus given to the House. The measure was modified and amplified, and became the law of the land (1867). The working class took its place by the side of the middle and upper class.

Progress of the reform question.

The Second Reform Bill.

Gladstone ministry.

As in 1832, a new spirit was breathed into legislation. The first parliament elected under the new system (1868) gave a majority against the opinions of the Conservative ministry. Mr. Gladstone became prime minister. The Irish Episcopal Church was disestablished, and the Irish land laws reformed. The ballot was applied to parliamentary elections, a new and improved system of elementary education was set on foot, and the practice of purchasing promotions in the army abolished. But no amount of zeal for improvement will make Englishmen hasty to forget the need of caution and moderation. The time came when the nation was no longer in a reforming mood. Interests of classes and trades were able to make themselves heard. Personal ill-feeling was roused by some members of the ministry, and a new parliament showed a large majority in support of a Conservative ministry (1874). It would not be in place here to discuss the difficulties of the present or the prospects of the future.

(S. R. G.)

TABLE OF SOVEREIGNS OF ENGLAND FROM THE NORMAN CONQUEST, AND PRINCIPAL OFFICERS OF STATE FROM THE ACCESSION OF THE HOUSE OF STUART.

SOVEREIGNS.

William I. (Conqueror)	1066	Henry VII	1485
William II. (Rufus)	1087	Henry VIII	1509
Henry I	1100	Edward VI	1547
Stephen	1135	Mary	1553
Henry II	1154	Elizabeth	1558
Richard I	1189	James I	1603
John	1199	Charles I	1625
Henry III	1216	Interregnum	1649
Edward I	1272	Charles II	1660
Edward II	1307	James II	1685
Edward III	1327	William III. and Mary	1689
Richard II	1377	Anne	1702
Henry IV	1399	George I	1714
Henry V	1413	George II	1727
Henry VI	1422	George III	1760
Edward IV	1461	George IV	1820
Edward V	1483	William IV	1830
Richard III	1483	Victoria	1837

LORD CHANCELLORS (C.) OR LORD KEEPERS (L. K.).

1603. Sir T. Egerton, L.K., cr. Lord Ellesmere 1603, and Viscount Brackley, 1616.
1617. Sir F. Bacon, L.K., cr. Lord Verulam 1618, and St. Albans, 1621.
1621. J. Williams, Bishop of Lincoln, L.K.
1625. Sir T. Coventry, L.K., cr. Lord Coventry 1628.
1640. Sir J. Finch, L.K., cr. Lord Finch 1640.
1641. Sir E. Lyttelton, L.K., cr. Lord Lyttelton 1641.
1645. Sir R. Lane, L.K.
1649. Interregnum.
1660. Sir E. Hyde, C., cr. Lord Hyde 1660, and Earl of Clarendon 1661.
1667. Sir O. Bridgeman, L.K.
1672. Earl of Shaftesbury, C.
1673. Sir H. Finch, L.K., cr. Lord Finch 1674, C. 1675, cr. Earl of Nottingham 1681.
1682. Sir F. North, L.K., cr. Lord Guilford 1683.
1685. Lord Jeffreys, C.
1690. Sir J. Maynard and others, commissioners.
1690. Sir J. Trevor and others, commissioners.
1693. Sir J. Somers, L.K., C., cr. Lord Somers 1697.
1700. Sir N. Wright, L.K.
1705. W. Cowper, L.K., cr. Lord Cowper 1706, C. 1707.
1710. Sir T. Trevor and others, commissioners.
1710. Sir S. Harcourt, L.K., cr. Lord Harcourt 1711, C. 1713.
1714. Lord Cowper, C.
1718. Sir R. Tracy and others, commissioners.
1718. Lord Parker, C., cr. Earl of Macclesfield, 1721.
1725. Sir J. Jekyll and others, commissioners.
1725. Lord King, C.
1733. Lord Talbot, C.
1737. Lord Hardwicke, C., cr. Earl of Hardwicke 1754.
1756. Sir J. Willes and others, commissioners.

Lord Chancellors (C.) or Lord Keepers (L. K.)—*continued.*

1757. Sir R. Henley, L.K., cr. Lord Henley and C. 1760, Earl of Northington, 1764.
1766. Lord Camden, C.
1770. C. Yorke, C.
1770. Sir S. S. Smythe and others, commissioners.
1771. Lord Apsley, C., succeeded as Earl Bathurst 1775.
1778. Lord Thurlow, C.
1783. Lord Loughborough and others, commissioners.
1783. Lord Thurlow, C.
1792. Sir J. Eyre and others, commissioners.
1793. Lord Loughborough, C., cr. Earl of Rosslyn 1801.
1801. Lord Eldon, C.
1806. Lord Erskine, C.
1807. Lord Eldon, C.
1827. Lord Lyndhurst, C.
1830. Lord Brougham, C.
1834. Lord Lyndhurst, C.
1835. Sir C. C. Pepys and others, commissioners.
1836. Lord Cottenham, C.
1841. Lord Lyndhurst, C.
1846. Lord Cottenham, C.
1850. Lord Langdale and others, commissioners.
1850. Lord Truro, C.
1852. Lord St. Leonards, C.
1852. Lord Cranworth, C.
1858. Lord Chelmsford, C.
1859. Lord Campbell, C.
1861. Lord Westbury, C.
1865. Lord Cranworth, C.
1866. Lord Chelmsford, C.
1868. Lord Cairns, C.
1868. Lord Hatherley, C.
1872. Lord Selborne, C.
1874. Lord Cairns, C.

Lord Treasurers or First Lords of the Treasury.

[The title was at first Lord Treasurer, unless when the Treasury was put in commission. Ultimately special rank was given to one of the commissioners as First Lord of the Treasury. From the time of the Earl of Essex (1679) the names given are those of First Lords, with the exception of the three printed in italics.]

1603. Lord Buckhurst, cr. Earl of Dorset 1604.
1608. Earl of Salisbury.
1612. Earl of Northampton and others, commissioners.
1614. Earl of Suffolk.
1618. Archbishop Abbot and others, commissioners.
1620. Sir H. Montagu, cr. Viscount Mandeville 1621.
1621. Lord Cranfield, cr. Earl of Middlesex 1622.
1624. Sir J. Ley, cr. Lord Ley 1625, and Earl of Marlborough 1626.
1628. Lord Weston, cr. Earl of Portland 1633.
1635. Archbishop Laud and others, commissioners.
1636. W. Juxon, Bp. of London.
1641. Sir E. Lyttelton and others, commissioners.
1643. Lord Cottington.
1649. Interregnum.
1660. Sir E. Hyde and others, commissioners.
1660. Earl of Southampton.
1667. Duke of Albemarle and others, commissioners.
1672. Lord Clifford.
1673. Viscount Dunblane, cr. Earl of Danby 1674.
1679. Earl of Essex.
1679. Lord Hyde, cr. Viscount Hyde 1681, Earl of Rochester 1682.
1684. Lord Godolphin.
1687. Lord Bellasyse.
1689. Earl of Monmouth.
1690. Sir J. Lowther.
1690. Lord Godolphin.

1868. W. E. Gladstone.
1874. B. Disraeli, cr. Earl of Beaconsfield 1876.

Secretaries of State.

[The substitution of two secretaries for one was the consequence of the increase of business. There was no distinction of departments, each secretary taking whatever work the king saw fit to entrust him with. During the reigns of the first two Stuarts, however, there was a tendency to entrust one secretary with the correspondence with Protestant states and their allies, and the other with the correspondence with Catholic states. Probably in the reign of Charles II., and certainly as early as 1691, two departments, the Northern and the Southern, were instituted. The secretary for the former took the Low Countries, Germany, Denmark, Sweden, Poland, and Russia. The secretary for the latter took France, Switzerland, Italy, Spain, Portugal, and Turkey. Home affairs were common to both. Ireland and the Colonies fell to the former secretary. Even when the departments were changed to Home and Foreign, and subsequently still further divided, the division was a mere matter of convenience. Every secretary can still carry on business in the department of another without a fresh appointment.]

1603. Sir. R. Cecil (cr. Lord Cecil 1603, Viscount Cranborne 1604, Earl of Salisbury 1609).

ENGLAND, The Church of, is that portion of the universal church of Christ located in England, having for its ministers bishops, priests, and deacons (see Preface to Ordinal), and being legally and historically continuous with the church of the most ancient times. The Church of England claims to be a "true and apostolical church, teaching and maintaining the doctrine of the apostles" (canon iii.). It acknowledges the supremacy of the crown, as that to which "the chief government of all estates of the realm, whether ecclesiastical or civil, in all causes doth appertain" (art. 37). It is established, or recognized by the law as the national church, and endowed—that is, the gifts of land or tithes made to it in ancient times are secured to it by the law. The Church of England has always had a national character. In mediæval Acts of Parliament it was called by the same name as at present, and was never identical with the Church of Rome, which was usually described as the court (curia) of Rome. In the 16th century, by a series of measures passed by the three estates of the realm, its vassalage to Rome was broken off, since which time the Roman court has maintained a hostile attitude towards it. The Church of England does not assume the right of condemning any national church (art. 34). It grounds itself on Holy Scripture and the three creeds (articles 6 and 8). It is Protestant, as sympathizing with the protest made in Germany against the errors of Rome, and Catholic, as claiming to be a portion of the universal church of Christ (25 Henry VIII., ch. 21, § 13; 1 Eliz., ch. 1).

I. *Historical Sketch.—British Period.*—Christianity was planted in Britain at an early period after its first promulgation. If we reject the traditions which assigned the first preaching of it there to the apostle Paul, or to Joseph of Arimathea, there is nevertheless a high probability that its origin in Britain was due to the intercourse of that country with the East, established in the first place by the Phœnicians, and continued by the colony planted by them at Marseilles. Glastonbury, according to William of Malmesbury, was the oldest church in Britain, and the traditions of Glastonbury are all of an Oriental character. Moreover, the eastern method of computing Easter, long retained by the British church, while it was strongly repudiated by Rome, points conclusively to the Oriental origin of the former. The history of the conversion of King Lucius, adopted by Ussher, is now universally rejected as unauthentic; but that the church in Britain had, by the end of the 3d century, made a considerable number of converts, the records of the persecution under Diocletian afford evidence. Constantine, then governor of Britain, received the edict of persecution, and proceeded, though unwillingly, to execute it, and to "pull down the churches" of the Christians (Lactantius). It was in this persecution (303) that Alban, a Roman soldier, suffered death at Verulam for sheltering a Christian priest, and Aaron and Julius at Caerleon-on-Usk. A still stronger evidence of the existence and vitality of the British church is supplied by the fact that three British bishops (Eborius of York, Restitutus of London, and Adelfius) were present at the council of Arles (314), and subscribed the canons. It is also highly probable that British bishops were present at the general council of Nicea. They appear to have been summoned to the synods of Sardica (347) and Rimini (360). Towards the end of the 4th century, Pelagius, who is known to have been a native of Britain, and Celestius, a monk of the Scotic or Irish race, brought the British church into notoriety by their heretical teaching, and their controversies with Augustine and Jerome. Both Pelagius and Celestius passed into the East, but their doctrines appear to have spread in Britain, and accordingly two French bishops (Germanus and Lupus) were sent by the synod of Troyes to counteract these errors. At a synod held at Verulam (429) the erroneous doctrines of Pelagius were repudiated. Gennadius (*Catal. Script. Eccles.*) mentions Fastidius, a British bishop, as having about this time composed several useful works; and Ninian, a native of North Wales, is said to have gone on a mission to the heathen Picts in the south of Scotland, and to have founded several churches among them. Patrick, the apostle of Ireland, was also a native of Britain, but the whole of his career is so obscured by contradictory legends that it is hard to ascertain anything reliable about him. One effect of the influence of the French bishops Germanus and Lupus on the British church was the introduction into it of the Gallican liturgy, which differed in many points from the Roman. Some of these differences were afterwards adopted by the Roman Augustine in settling the use for England, so that the worship of the English Church has never been identical with that of Rome. As the Roman power was withdrawn from Britain, and the people, untaught to defend themselves, fell victims to the inroads of various heathen invaders, the remains of the Christian church in the land were driven either into the far west, or into the mountains of Wales, and during the 5th and 6th centuries Britain became again substantially, but not entirely, a heathen country.

Saxon Period.—The story which relates how Gregory the Roman bishop was moved to send the Benedictine monk Augustine and his 40 companions on a mission to the Anglo-Saxons is one of the most familiar in church history (597). Bertha, the French-born queen of Kent, being a Christian, was the great support of the monks, but the relics of the old Christianity of the land were also an important help to them. Two Christian churches (at least) were in existence close to the walls of Canterbury. A large number probably of the Christianized Roman-Britons existed as a subject population. The traditions of Christianity survived. Hence the rapid success of Augustine and his companions, in spite of the distant and somewhat hostile attitude assumed by the leaders of the British church towards them. Thus the southern and central parts of Britain were rapidly reconverted to the faith. There were bishops at Canterbury, London, and Rochester. The conversions of Northumbria and Mercia, the north and east, followed, chiefly through the labors of Paulinus, who had accompanied as chaplain the Kentish princess Ethelburga to the kingdom of her husband Edwin of Northumbria. Meanwhile, concurrently with the work of these Roman missionaries, the monks of Iona—the monastery established in one of the western isles of Scotland by Columba, a disciple of St. Patrick—had done much in the conversion of the south of Scotland and north of England. Among these Aidan was conspicuous for his zeal and devotion. The teaching of the Scotch missionaries was in accordance with the old British type of Christianity, from which their religion was derived, while the Roman clergy held different customs as to the time for celebrating Easter, the tonsure, the manner of baptism, and other matters. To effect if possible an agreement, a conference was held at Whitby (664), in which Colman on the one side and Wilfrid on the other took a principal part. The Roman party gained the advantage, and the British peculiarities were gradually merged in the greater power and vigor of the Roman system. In 668 Theodore, a Greek, was consecrated archbishop of Canterbury by Pope Vitalian. Nearly the whole of the island was now Christian, and all parts of it recognized and submitted to Archbishop Theodore. His administration of the church was marked by great vigor and wisdom. He was especially solicitous to promote learning. At a synod held at Hertford (673) the Easter dispute was settled, and various canons for the regulation of the church agreed upon. A large number of new sees were also founded by Theodore, and a very useful work was done by him in the foundation and settlement of parish churches, and the arrangement that a portion of the tithes, previously paid by the Saxon thanes to the bishop and the cathedral, should be paid by them to the priest of their own church. Thus Archbishop Theodore may be said to have been the founder of the national church of England. The history of this period and part of the following century is related in great detail by Bæda or Bede, a monk of Jarrow, who took much pains to collect his materials, and is a thoroughly trustworthy writer. Though himself a monk, Bede speaks very strongly against the multiplication of monasteries, and of the dissolute lives often led in them (Letter to Egbert). In the year 736 Egbert, bishop of York, obtained the pall from Rome, and was thus constituted a metropolitan with the three Northumbrian bishops as his suffragans. In 747 a synod of the bishops of the southern province was held at Cloveshoe, and a body of canons was agreed upon, regulating many points of doctrine and practice. Among other things, it was ordered that the clergy should teach the people the creed and the Lord's Prayer in the vulgar tongue (into which they had been translated by Bede), and explain to them the nature of the sacraments. The second canon of this synod indicates a complete independence in the English Church, and implies a censure on any who ventured to appeal to Rome, as had been lately done by Wilfrid. The Saxon church at this period was one of the most flourishing in Europe. It sent out missionaries to Germany; it produced poets of considerable power, as Aldhelm; it furnished to Charlemagne the most learned and efficient of his instruments for the revival of learning in Alcuin of York. Synods were continually held to regulate matters of discipline, and though the acquirements of the clergy were but slender, yet they were probably equal, if not superior, to those of the clergy of other churches of the day. But this happy state of things was rudely interfered with by the irruptions of the pagan Danes. These barbarous enemies seem to have directed their attacks specially and designedly against the monasteries and churches, either out of peculiar hatred to the Christian faith, or because they expected to find these religious houses the special receptacles of treasure. Thus the great Benedictine abbeys of Winchester, Peterborough, Bardney, Croyland, and all the grand foundations of Northumbria, were utterly ruined by them, the monks massacred, the buildings burned to the ground; and so complete was the overthrow of monastic establishments by these savages, that not until the time of Dunstan towards the end of the 10th century could monasticism be restored in England. The reign of Alfred was a real boon to the church, not only as breaking the power of the Danes, but as introducing a strong stimulus to the cultivation of learning. Whether Alfred is to be regarded as the founder of the University of Oxford or not, he certainly established schools, and induced learned men to visit the country. Among these was John Scotus, surnamed Erigena. Erigena is perhaps the most remarkable figure in the whole of the Dark Ages. He was nearly, if not altogether, a pantheist in religion. He wrote both against predestination and the gross material view of the eucharist then beginning to be set forth by Radbert. His book on this subject still survives under the name of *Ratramn*. He passed from the court of Charles the Bald to that of Alfred, where he was in high favor. It may be gathered from this that his opinions were not unacceptable to the king, and this is one of the many indications that the early English Church did not accord with the Roman in the materialistic doctrine of the eucharist. Alfred's own literary labors were considerable. His translations of Gregory's *Pastoral Care*, Boetius's *Consolation*, and Bede's *History* were all calculated to help his clergy in advancing in learning, and in a more especial manner was this the case with his translations of various parts of the Latin version of the Scriptures into the vernacular tongue. After their decisive defeat by Athelstan (in 938), the Danes in England generally began to embrace Christianity, which prepared the way for its reception by the second great series of invading bodies towards the end of the century. The regulations made by Athelstan greatly stimulated the increase of parish churches. Priests were to be legally entitled to the rank of thanes, and a churl or franklin might reach the Witenagemot if, among other conditions, he had a church with a bell-tower on his estate. Accordingly, there is evidence that about this time the number of parish churches was very considerable, there being in Lincolnshire alone upwards of two hundred. The monastic system was in complete abeyance, and all those who desired to become clerks were attracted in this direction. It was the great work of Dunstan, a Glastonbury monk, who rose to be archbishop of Canterbury (959), to undo as far as possible this wholesome state of things. He commenced a crusade against the married clergy, and in favor of celibacy and the cœnobitic life. He built and endowed about forty monasteries, and at most of the bishops' sees compelled the secular clergy, who had formed the chapter, to retire in favor of the regulars, who were then constituted the chapter of the cathedral church. This connection of the cathedrals with monasteries was a special peculiarity of the English Church. The doctrine of the Church of England at this period may be fairly gathered from the writings of the Abbot Ælfric, which were approved by Sigeric, archbishop of Canterbury. Ælfric was the author of an English grammar and dictionary, and he wrote two volumes of sermons or homilies, which are in great part translations from the fathers of the church. In these the eucharist is explained, not as involving any material change in the elements, but as conferring the spiritual presence. At this time the clergy were obliged to possess a considerable number of books, and to expound the gospel every Sunday to the people in English, and the creed and the Lord's Prayer as often as possible. During the sad times which followed, church services were everywhere interrupted and the clergy dispersed. Archbishop Elphege fell a victim to the heathen Danes, but when at length King Canute declared himself a Christian, things rapidly assumed a more promising aspect for the church. The laws of King Canute are even of a remarkably pronounced Christian tone. When in 1042 the English family was restored to the throne, the church was at its highest point of power and influence. But Edward's long residence in Normandy led him to introduce many foreign prelates, and found alien priories, a policy which not only prepared the way for the great change which was now to come upon the church, but was the cause afterwards of many scandals and abuses.

Mediæval Period.—At the time of the Norman Conquest there were about 4500 parish churches in England, besides numerous monasteries and the cathedral churches of the sees. The number of clergy is doubtful, but it is conjectured that the small number given in the survey (1600) may be accounted for by the fact that when a church is mentioned the priest belonging to it is implied (Sir H. Ellis). By various laws and directions of the English kings, the clergy had acquired a right to the tithe of all movable goods; and the gifts of the faithful had enriched the church with lands to the amount of about three-tenths of the whole property of the country. The priest took rank with the thane; the bishop ranked with the ealdorman, and presided jointly with him over the shire-gemot. The correctional police of the whole population was in the hands of the church. Civil and ecclesiastical causes were heard in the same courts, and synods adjudicated in cases of property when the rights of the church were concerned. This powerful corporation paid only a doubtful and undefined allegiance to Rome, and was not at all in the condition of vassalage in which most of the Continental churches were. It was in order to gain this vassalage from the English Church that the pope was induced to grant to Duke William the license which sanctioned his attack upon England. The Conquest thus assumed almost as much of an ecclesiastical as a secular character. Hence the hard measure meted out to Saxon bishops and abbots. Hence the completion of Dunstan's work in enforced clerical celibacy and the exaltation of monasticism. Hence the complete separation of the civil and ecclesiastical jurisdictions, and the exceptional immunities given to churchmen. The conqueror was crowned, not only by the archbishop of York, but also by two Roman cardinals as legates of the pope. These emissaries joined in a council with the Norman-English bishops (1070), authorizing, on the part of the pope, the deposition of the English primate and other bishops, and the spoliation of the monasteries, and effecting the complete subjection of the English Church to Rome. The establishing of the papal sovereignty over the English Church, and the settling of the Romish system in England, was entrusted to Lanfranc, a Lombard by birth, and lately abbot of Caen in Normandy. This very able man, becoming archbishop of Canterbury, contrived to overpower the rival claims of Thomas, archbishop of York, and, aided by the pope's authority, to rule with absolute sway over the English clergy. A vast increase of vigor was everywhere soon discernible in the Church of England. The Norman prelates, skilled in architecture, erected those grand cathedrals which still in many places remain to do honor to their taste and munificence. The sees were generally transferred from the small places, in which they had been located by the English, to towns which had grown into greater importance and population. Thus Dorchester gave place to Lincoln, and Thetford to Norwich. All places of trust and dignity in the church were soon in the hands of foreigners. Yet Lanfranc could not effect the complete supremacy of the monastic system. In the new foundation of Lincoln, secular canons were established as the chapter rather than monks, and about half the cathedrals of England retained this constitution. King William also soon showed signs of resistance to the claims of that *imperium in imperio* which his policy had created. He refused fealty to the pope on the ground that none of his predecessors had paid it. He claimed for himself the right of deciding between the rival claims of popes, and that no canons should be promulgated by the clergy without his consent—the very claim which, after nearly five centuries of contention, the clergy themselves admitted in the time of Henry VIII. The sagacity of the Conqueror must soon have discovered that he had introduced into the land an influence of necessity antagonistic and dangerous to the kingly authority. The name of Anselm, the successor of Lanfranc as primate, is famous in English church history as having boldly maintained a contest, during two reigns, for the privileges of the church, not only against the king, but also against the bishops and clergy, who were all ready to yield to the royal claims. The issue of this contest (1107) was that the crown was obliged to abandon its ancient right of investing the bishop in the jurisdiction of his see by the gift of the ring and crosier, accepting in lieu of that merely his homage for his temporalties, that henceforth the church was to be free to hold synods and enforce discipline, and that appeals were to lie to Rome. To Anselm thus must be allowed the credit (if it be a credit) of having emancipated the church from feudalism to the state and transferred its feudalism to Rome. It is hardly to be wondered at that his successor William of Corboil, in order to make this supreme authority of Rome more available for the purposes of his administration, consented to accept the appointment of legate of the pope (1125). There remained for the completion of the system two other points to be fought out under succeeding primates, viz., the exemption of clerks from the civil jurisdiction, and the right of the pope to nominate bishops in spite of the crown. During this century the Roman Church was at the height of its power and influence, the celibacy of the clergy, strenuously pressed by Rome, was becoming the rule rather than the exception, and a great revival of monasticism had given birth to divers orders in which the lax discipline of the old Benedictines was replaced by an ascetic strictness. Of these the most famous was that of the Cistercians or white monks, which was introduced into England in 1128, and which soon numbered 30 houses in England, some of which were conspicuous for their magnificence and beauty. The settlement of the Cistercians in England not only gave an immense impetus to monasticism, but it introduced into the church of the land a principle most disastrous in its after effects to the discipline and well-being of the church. The Cistercians were, by the charters granted to them by the pope, to be exempt from all episcopal visitation and control. They were only amenable to the rule of abbots of their own order. This exemption was naturally destructive of all discipline, and it was a privilege so greatly coveted by houses of other orders that they stopped at no deceit or forgery of documents in order to obtain it. St. Albans was the first great Benedictine abbey that obtained this privilege. Many others were occupied in a continued struggle for it. The military orders and their affiliated houses enjoyed it. The exemption of the abbey from episcopal control carried with it the exemption of the churches, often numerous, which were connected with the religious house by its having become possessor of their tithes. Hence sprang the greatest disorders and difficulties, resulting, in fact, in the abeyance of all order, and the grievous licentiousness of many religious houses. That which ecclesiastics were striving after in the matter of church laws, the laity were encouraged to endeavor to obtain in the matter of civil laws. The privilege of being tried only in church courts, and being amenable only to church censures, was claimed for all connected with the church. To obtain this right, laymen took some degree of minor orders, or entered into the service of some ecclesiastic. As all such could plead "benefit of clergy," and, in fact, obtain a practical immunity from law, the greatest abuses prevailed. William of Newberry tells us that hundreds of murders were committed by "clerks," for which no punishment was exacted. To abate this scandal was the great work of King Henry II., the most able of the early sovereigns of England, and the founder of that judicial system which has borne such good fruit. To uphold it was the work of Thomas Becket, archbishop of Canterbury. By the Constitutions sworn to at Clarendon (1164) a sort of compromise was made. Clerks accused of crimes were obliged to plead in the courts of common law, but, on proving their clerkship, were to be proceeded against in courts Christian, under the surveillance of the lay authority. Should they plead guilty, they were to be dealt with by the lay courts. The same Constitutions enacted that there should be an appeal from the archbishop to the king, which should be final, thus cutting off the appeal to Rome. Bishops were to be elected by the clergy, but subject to the approval of the king. The power of excommunication and interdict was also limited, and the king had the revenues of all vacant bishoprics given to him. These Constitutions, which appear so favorable to the cause of the crown, did not, in fact, settle the dispute. The archbishop at once repudiated them. The pope declared them void, and the issue of the struggle was, in the event, in favor of the claims of the clergy. In the miserable reign of John, a vigorous pope claimed and obtained the right of nominating to the primacy and sees of England, without any regard to the king or the national church. The country was subdued by the savage expedient of an interdict, which the superstition of the age did not allow it to disregard; and the king, at length completely prostrate at the feet of the pope, made a shameful cession of his kingdom, and received it back as a fief of the church. The pope, having achieved the right to dispose of English bishoprics, now claimed the right of disposing of English benefices, which were granted in great numbers to Italians and other foreigners, who never troubled themselves to visit the church assigned to them, but merely received the revenue through an agent. The degradation and disgrace of the Church of England reached its extreme point during the long and inglorious reign of Henry III., when the first symptoms of reaction began to manifest themselves. The most famous scholar of his day, Robert Grosseteste, bishop of Lincoln, after being long a strong supporter of the papal claims, became their outspoken opponent. The extreme vigor and fearlessness of his character, and the high reputation he enjoyed, enabled Grosseteste first to break down the claims for exemption from episcopal control set up by the monastic bodies, then to bring under his control the chapter of his cathedral church, and finally to refuse to admit a nominee of the pope to a stall in Lincoln. For this last act of independence he was excommunicated, but he utterly disregarded the sentence, declared that in acting as he had done the pope was no better than Antichrist, and encouraged the English to assert the nationality of their church and to disregard the claims of Rome. At the same time, violent popular tumults were excited against the foreign incumbents, and remonstrances were poured into Rome from the barons and chief men against the injustice inflicted on the English Church. At the synod of Merton, held in 1255, the claims of the church to a special and dominant jurisdiction were pressed to their highest point. The vigorous administration of Edward I. introduced various checks to the growing power of the clergy. Parliament had now become a reality, and was able to contend with and check the church synods, which about the same time were reinforced in strength by the admission of representative proctors from the clergy. The Statute of Mortmain (7 Edward I. c. 2) restrained the acquisition of lands by the church. That of *circumspecte agatis* limited the claims made at Merton. The inability of the clergy to refuse taxes to the crown, even when they were supported by a papal bull, was clearly demonstrated (1297), and a bishop of Worcester, who had ventured to accept a grant of the temporalties of his see from the pope, was obliged to renounce the bull and submit to a fine of 1000 marks. At the parliament of Carlisle (1305) stringent regulations were made with a view of checking papal exactions, and the provisor statutes of Edward III. effectually limited the papal power of disposing of English benefices. The *præmunire* statute (16 Richard II. c. 5) opposed a firm barrier to papal claims; and had not the necessities of the house of Lancaster obliged its princes to court the church, and the confusions of the Wars of the Roses supervened, it is probable that the teaching of Wickliffe would have inaugurated in England as complete a revolt from Rome as that witnessed in the 16th century. The immense power and wealth enjoyed by the Church of England during the Middle Ages, and its complete freedom for self-regulation, did not preserve it from great shortcomings and corruptions. A continuous catena of satirists and censors, from William of Malmesbury to Dean Colet, have brought the most grievous charges against the mediæval clergy, on the grounds of simony, negligence of duty, and licentiousness. In 1250 Bishop Grosseteste, before the council of Lyons, spoke of the clergy of that day in terms which are absolutely appalling. In the 15th century the letter of Pope Innocent to Cardinal Morton describes the regulars in England in language almost as strong as that employed afterwards by Bale and Foxe. It may, however, not unfairly be alleged that these general charges are of far too sweeping a character. To the student who looks a little deeper, there are many evidences of simple and earnest devotion discernible in the mediæval church. The establishment of the mendicant orders in the 13th century produced at first a great revival of religion in the church. Many of the chief towns had been utterly neglected by the clergy; and the country villages were mostly dependent on the chance ministrations of a monk of some neighboring monastery, which had absorbed the tithes of the parish under pretence of supplying its spiritual needs. The Franciscans, obliged by their rule to tend the sick and suffering, ministered among a population scourged by leprosy and decimated by epidemics; the Dominicans, or preachers, brought into use a more attractive and homely style of sermon, and conveyed instruction to many utterly dark places. Yet the corruption of the friars by worldly influences was very speedy, and when in the 14th century Robert Langland and John Wickliffe wrote, it was specially against the friars that their attacks were directed. The great work of Wickliffe was to raise a protest against Rome, to oppose the prevailing superstitions on the eucharist, and to give to his countrymen a vernacular version of the Scriptures. His writings were not altogether free from a communistic tinge, but they were of immense value in recalling the minds of the men of his age to scripture truth, and the vast effect they produced was not only perceptible in his own time, when it was said by the chronicler Knighton that every other man was a Wickliffist, but was also perceptible 150 years later, at the beginning of the English Reformation. There must have been, therefore, preachers or teachers of his views during all this time, though obscured and concealed on account of the persecutions which fell upon the Lollards. Indeed, did space allow it, an under-current of simple scriptural faith might be traced all through the mediæval period, while the rulers of the church, in a spirit of thorough worldliness, were sanctioning every gainful form of superstition, and were in too many instances given to luxury and license. In the 16th century all the old devices for upholding the faith seemed to be drooping and ready to die. The monastic system had fallen into utter disrepute, and for 150 years but six monasteries had been founded in England. The friars, changed from being preachers into peddlers and sturdy beggars, had a bad reputation everywhere. Pilgrimages had become mere promenades for amusement and license. Relics vying with each other in grotesque pretensions were a mere subject of ridicule to all but the most ignorant. Meanwhile the traffic in indulgences had shocked the moral sense even of that corrupt age; and a series of popes, either soldiers, sceptics, or men of pleasure, had not availed to recommend the system of which they were the heads. In England the bishops were almost universally either statesmen, lawyers, or diplomatists. The clergy had absolutely abdicated the preaching function and the pastoral care, and contented themselves with a meagre circle of routine duties. When, in cathedrals or on high occasions, sermons were preached, the audience was destined to hear nothing but the ingenious subtleties of Aquinas or Scotus, portions of whose writings were often taken for a text. The church seemed to be threatened with an absolute collapse, unless some renovating power could be brought to bear upon it.

Reformed Period.—In this state of weakness and corruption, the accession to the throne of England of a young and vigorous sovereign (1509) gave an impulse towards improvement in both church and state. The tastes of Henry VIII. were decidedly ecclesiastical. He had been well educated, and was very fairly learned. He had chosen for his chief minister a churchman who had raised himself by ability from a low origin, and who entertained the highest views of the prerogatives of learning, and the value of education, while he was hampered by no superstitious reverence for effete institutions, nor prepared to condemn and punish as heresy every departure from commonly received opinions. The conjuncture seemed favorable for such a reformation as was desired by Erasmus, Thomas More, and John Colet, who were then living much together, and endeavoring by lectures and writings to bring about some resurrection of learning and intellectual life from the death-like trance in which they were lying. How far the plans of the educational reformers might have proved successful cannot be judged, for the opportunity for calm measures rapidly passed away. The Saxon monk Luther threw down the gauntlet before the pope, and proclaimed internecine war. This scattered the ranks of the educational reformers, turning some of them into fierce persecutors, and placing even the relentless satirist Erasmus, the determined foe of the monkish superstitions, on the side of those whom he had so violently assailed. Luther's Treatise *De Babylonica captivitate Ecclesiæ* was published in 1520, and by the next year there is abundant evidence, not only that it was well known in England, but that it had produced much effect. In that year both Archbishop Warham and Bishop Longland write to Cardinal Wolsey, urgently calling upon him to take some steps for the suppressing of the growing Lutheranism of Oxford. Wolsey, thus constrained to act, went through the pageant of a public burning at St. Paul's of all the Lutheran books which could be collected, some time in August, 1521. In the same month (August 25) came forth King Henry's treatise against Martin Luther (*Assertio Septem Sacramentorum adversus Martinum Lutherum, edita ab invictissimo Angliæ et Franciæ rege et domino Hiberniæ, Henrico, ejus nominis octavo*). This attack, which was very violent, and which elicited equal violence in reply, produced a complete schism between the literary reformers of England and the religious reformers of Germany and Switzerland. Two of the former, Bishop Fisher and Sir T. More, joined in the conflict, the latter with somewhat disgraceful violence, while the king, flattered by the title of Defender of the Faith conferred on him by Pope Clement, was enlisted as a thorough-going partisan against the Lutherans. There is reason to believe, however, that this was not the case to anything like the same extent with Cardinal Wolsey. In 1523 he distinctly refused to send a commission to Cambridge to drive out Lutheranism. In his splendid structure and grand conception of Cardinal College, which was fast growing towards completion in Oxford, he nominated as fellows a band of Cambridge men who were known to be pronounced Lutherans. This great man seems to have believed in the power of truth to defend itself, and to have been thoroughly averse to coercive punishments for heresy. But in this he stood nearly alone, and the march of events soon transferred to a party of Englishmen that bitter hatred which had been conceived by the king, Sir T. More, and the bishops against the followers of Luther. In 1526 William Tyndale, by birth a Gloucestershire man, by education connected with both Oxford and Cambridge, published his first two editions of the New Testament in English at Worms. The English bishops, who knew that Tyndale had been in communication with Luther, immediately took steps for hindering the circulation of these books in England. Many were burned at Cheapside (1527); but the supply was by no means stopped, and in addition a large number of English works, printed abroad, and all breathing the extreme violence and thoroughness of Luther's spirit, made their way into England. Sir Thomas More was selected by the bishops as the champion of orthodoxy, and urgently pressed to undertake the refutation of these books. Hence commenced the controversy between him, Tyndale, Fryth, and Barnes, which continued for some years. Sir Thomas More was specially angered by a clever but somewhat scurrilous brochure, entitled *The Supplication of Beggars*, written by Simon Fish, a quondam lawyer of Gray's Inn, in which the doctrine of purgatory is mercilessly satirized. To this he replied in the *Supplication of Souls*, an imaginary appeal of the souls in purgatory against the new doctrines, which were likely to leave them bereft of the aid of prayers and masses. Meanwhile the unfortunate divorce case had proved the ruin of Cardinal Wolsey; and Sir T. More, succeeding him as chancellor, had used his power, with the full concurrence of the king and the bishops, to bring many of those who held with Luther or Tyndale to the stake. But while the authorities were thus embittered against reformation which, under other circumstances, they might have treated more favorably, there had been steadily growing since the commencement of the reign a feeling of bitter dislike and exasperation of the laymen against the clergy, which was destined to produce very remarkable results. This had been fostered by several causes, among which the determined attempt made by the clergy to resist an enactment of parliament designed to restrict the privilege of benefit of clergy (4 Henry VIII. c. 2) was one. Another was the case of Richard Hunne, a merchant tailor of London, committed to prison by the bishop, and found hanging dead in his cell. His murder was freely attributed to the bishop's commissary, and the fact of his dead body having been burned on the plea of heresy increased the odium excited by this suspicion. That the king shared in the prevailing feeling is evident by his severe treatment of convocation for their trial of Dr. Standish, who had justified the Act of Parliament directed against the privileges of the clergy. On this occasion (1516), Henry is said to have clearly claimed and explained that supremacy over the church which was afterward conceded to him (Keilway's *Reports*). But that which most tended to exasperate the laity against the clergy at this period was, without question, the state of the church courts, and the vexatious disciplinary proceedings to which, on the information of any disreputable person, the laity were constantly subjected. The evil was admitted by some of the bishops, but it seemed as if they were powerless to remedy it. Archbishop Warham had called upon his convocation to help him in the matter, but Wolsey unwisely interfered, desiring to show his supreme power as legate. He afterwards summoned the convocations of the two provinces to meet as a legatine synod (June, 1523) to treat of the reformation both of the laity and the clergy. Nothing, however, was done to remedy the crying grievance, and the laity determined to take their cause into their own hands. There were thus two elements at work in the country at this period likely to produce important changes in the ecclesiastical system, viz., the rapid development in England of the religious opinions of the foreign reformers, and the growing feeling of bitterness entertained by the laity against the clergy. To these was added before the meeting of the famous parliament of November, 1529, another very important factor, in the disappointed and angry temper of the king. Henry, who had imagined that his will must needs be law, had found himself thwarted in the matter of his divorce by the pope and the Roman curia; and the abortive termination of the trial at the legatine court of Blackfriars had roused him to fury. His anger was directed first of all against Wolsey, but he was inclined to be harshly disposed also against the whole of the clerical body, while he already contemplated taking vengeance on the pope by the extremest legal enactments. Thus a state of feeling had been generated in England altogether different from that which had existed before Luther began to write, and when merely educational and literary reforms were contemplated. More violent and trenchant reforms seemed to be required, and these were now to find expression in the work of the parliament and convocation of 1529. In the first session of this parliament three measures affecting the revenues and fees of the clergy were passed, and Bishop Fisher, who assumed a very high tone in defending his order, was complained of by the Commons and censured by the king. The clergy saw themselves seriously threatened, and when, after Wolsey's fall, the whole of the clerical body was declared by the judges to have incurred the penalties of the præmunire statute, the convocations, acting for their brethren, were ready to purchase immunity by the sacrifice of very large sums. But the king, not satisfied with this, demanded more from the clergy than a mere money payment. He demanded of them their acceptance of his claim to supremacy over the church, which was in fact a distinct renunciation of their allegiance to Rome. After much disputing as to the terms, this was at last agreed to by the two convocations (February and May, 1531), but with the saving clause—*As far as is permitted by the law of Christ.* When the Act of Parliament which embodied this acknowledgment of the clergy came afterwards to be drawn, this saving clause was omitted. From the moment when the clergy agreed to accept the royal supremacy, the rupture with Rome went on apace, and was embodied and carried out in one statute after another. The clergy who had yielded to the menaces of the præmunire law were soon compelled, by an attack brought upon them by the extreme unpopularity of the church courts, to concede another very important point. On March 18, 1532, the Commons presented to the king an address specially directed against the ordinaries, or those of the clergy who possessed jurisdiction, but bringing also many heavy charges against the whole of the clergy. The answers drawn up by convocation satisfied neither the king nor the Commons, and the convocation was called upon to promise that from henceforth no new canons should be made or promulgated without the king's consent, that a review of all the old canons should take place by a body of commissioners, and that only those ratified by the king should hold good. This complete surrender of the whole code of church law into the king's hands was to a certain extent evaded by the clergy, but substantially they agreed to the king's requirements (May 16, 1532). Henceforth no convocations could be summoned but by the king's writ, no church law could be made but such as the king approved, and the old canons were to be subjected to review. This important transaction, known as the *Submission of the Clergy*, may be considered as the supplement to their acknowledgment of the royal supremacy, and as completing their rupture with Rome. The acts of the convocation which followed—the petition against the payments exacted from them by the pope, the formal renunciation of the supremacy claimed by him—were natural sequents of the other. Meantime the parliament went rapidly forward in the work of breaking off the fetters of Rome, and securing the independence of the national church. In the session of 1533 was passed the famous statute for *restraint of appeals*, which, grounding itself upon historical precedent, makes all ecclesiastical appeals from henceforth terminable within the kingdom (24 Henry VIII., c. 12). Other acts embodied the concessions made by the clergy (25 Henry VIII., c. 19), made illegal papal appointments to bishoprics (25 Henry VIII., c. 20) and papal dispensations (c. 21), and enacted the royal supremacy in the strongest terms (26 Henry VIII., c. 1 and c. 13). The last work of this remarkable parliament was to give to the king all monasteries of less value than £200 a year, and all others which within a year after the passing of this Act (February, 1536) should be surrendered to him. The way towards this measure—which was revolutionary, not only in its religious, but also in its social aspect—had been paved by the proceedings of Cardinal Wolsey in providing a foundation for his contemplated colleges. A papal bull had authorized the suppression of forty of the smaller religious houses for this purpose. Wolsey had only imitated the example of Chicheley, Waynflete, and Wickham, and it was suggested to the king, by Thomas Cromwell, that he could not be wrong in following these eminent churchmen. Cromwell had been secretary to the cardinal, and had distinguished himself by advocating his cause after his fall. For some time past he had been the principal adviser of Henry in all the measures taken to free the land from Rome, and the most remarkable use which the king had made of the ecclesiastical supremacy conferred upon him by the clergy and the parliament was to appoint Cromwell his vicar-general, with full powers to exercise the undefined authority belonging to the royal supremacy over all churchmen and churches. By virtue of this power Cromwell had made a visitation of the monasteries by means of certain commissioners; and a report strongly censuring their state, both moral, disciplinary, and financial, had been presented to parliament. On the strength of this report, the Act suppressing all the smaller religious houses of friars, canons, monks, and nuns was passed. The larger houses were destined soon to follow, for a rebellion having been excited in the north by the suppression of the smaller houses, the opportunity of its suppression was made use of to induce the greater abbeys to surrender, in the hope of thus escaping inquiry into their complicity in the rising. An Act confirming these surrenders was passed (1539), and the king thus became possessed of the whole monastic wealth of England, both in movables and lands. A court called the Court of Augmentations was established to regulate the transfer. Small pensions were assigned to the monks and nuns thus forcibly driven into secular life, and the remainder of the sum, amounting in modern value to not less than £38,000,000, was expended in various ways. Six new sees were founded, some grammar schools were established, some forts built, but the greater part of the money was given with reckless prodigality to the courtiers. While the suppression of the monasteries was in progress, many acts were done tending to establish the new state of things, and to complete the revolt of the Church of England from the dominion of Rome. The king had pressed the acknowledgment of his supremacy, and had sacrificed, in doing this, many victims, and among them, two of the most eminent men in England, Bishop Fisher and Sir Thomas More (1535). In 1536 the first authoritative statement of reformed doctrine was made. Ten articles were drawn up by the king and accepted by the convocation of the clergy, which speak only of three sacraments, declare that the whole Christian faith is to be found in the Bible, and disparage the worship of images, the invocation of saints, and the belief in purgatory. In the following year (1537), a larger body of reformed teaching was put forth in a book sanctioned by authority, called

The Institution of a Christian Man. But that which tended most of all to the rapid spread of reformed doctrine was the publication of the Bible in English. In 1530 the king had promised that this should be conceded. In 1534 the convocation, at the instance of Archbishop Cranmer, had reminded him of his promise, and petitioned for its fulfilment. But there was no immediate prospect of this coming about. Consequently Cromwell, whose political life was staked on the progress of the Reformation, employed Miles Coverdale, in concert with Tyndale in Germany, to make and print a translation of the Scriptures from the Latin and German versions of them. This was published in England (October, 1535), and though not formally approved, was tolerated by the king. Another version, which embodied all Tyndale's translations, appeared in 1537 (Matthew's Bible), and in 1538 Cromwell ventured to insert in a body of injunctions, issued by him for the direction of the clergy, an order that each parish should procure a copy of what was called the Great Bible. This referred to an edition not yet published, which came forth in the following year (1539); and in the next (1540) was republished with a preface written by Archbishop Cranmer. The English Bible being thus fairly launched in the country, the attempts made by the reactionary party to check the advance of reformed opinions all proved abortive. The king vacillated strangely between one influence and the other. In 1539 he was himself the author of a law intended to uphold the old faith with extreme severity. Under this the punishment of death was decreed against all who refused to acknowledge the doctrine of transubstantiation, and very rigorous penalties against five other proscribed opinions. The fall of Cromwell soon followed, and the reactionary party seemed for a moment to have triumphed. But the influence of Archbishop Cranmer with the king could not be overthrown, and further progress in reformation was soon to be discerned. The law of Six Articles was modified and allowed to lie dormant; the service-books were reviewed and amended by convocation; the litany was published in English; the king himself put out an English primer, in which the strongest statements are made as to the desirability of having prayers and services in English. In fact, an English prayer-book and an English service for the mass were both in course of construction by convocation when King Henry died (1547). By his will he nominated sixteen councillors to administer affairs during the minority of his son Edward VI., and in this council the reforming or Protestant element soon had complete sway. A book of homilies containing reformed doctrine was ordered to be read in all churches. In 1548 a service in English was published to be appended to the Latin service of the mass, and provision was made in this for the reception in both kinds by the laity. In 1549 an English prayer-book, carefully drawn up from the old service-books of a body of divines, accepted by convocation and parliament, was given to the church, and the use of it was made compulsory by an Act of Uniformity. Images were soon removed from churches, altars taken away to be replaced by tables, and Archbishop Cranmer, zealously bent on the work of reformation, earnestly invited all the most distinguished foreign Reformers to visit England, that, if possible, the lovers of reformation might agree to a confession of faith, to be opposed to the confession of the Romish Church then being formulated and settled at the Council of Trent. Many of the foreigners thus invited did in fact visit England, and their influence was very considerable. With their help a body of 42 articles was drawn up by the English divines, which, having been approved by convocation and sanctioned by the king, the clergy were called upon to subscribe. In 1552 was published a second prayer-book, which, with some additions, and a considerable retrenchment of the first book in the matter of ceremonial, had altogether a much more Protestant character than its predecessor. The ordinal was also a second time reformed. The extreme rapaciousness of the chief men of the state at this period led to a seizure of church property, which greatly impoverished and kept back the growth of the church in after years. The impropriate tithes, which in very many cases had been acquired by monasteries, went, at their suppression, into lay hands, and no suitable provision was made for the remuneration of the clergyman of the benefice. Hence the clergy for a long period were of a low social grade, and very few of them competent through learning to become preachers. When, on the death of Edward (1553), Queen Mary succeeded him, the majority of the clergy accepted without hesitation the re-establishment of the old superstitions. There was, however, a certain number, estimated variously from 1500 to 3000, who were incapacitated from doing this. These were the clergy who had taken advantage of the enabling law, passed in the last reign, to contract matrimony. These clergy were now everywhere expelled from their benefices, and some of them were harshly treated. About 800 of the laity and clergy who favored reforming views, foreseeing the danger to be apprehended from the queen, escaped at her accession to various towns on the Continent; the remainder of like views in England soon found their way into prison, until it should be determined what policy to adopt toward them. There is reason to believe that Bishop Gardiner, who was Mary's chief adviser at the beginning of her reign, was in favor of a lenient policy, and that Cardinal Pole, who arrived in England as papal legate (November, 1554), was also opposed at first to harsh measures. But the temper of the prince whom Mary had married, as well as her own, were both favorable to persecution, and it was determined in the council to proceed to the extremest measures sanctioned by the law against the so-called heretics. A commission of bishops was opened (January, 1555), for the trial of heretics. On February 4 was burned for alleged heresy at Smithfield Mr. Rogers, prebendary of St. Paul's; on February 8, at Coventry, Mr. Saunders, rector of All Hallows, Bread St.; on February 9, Hooper, bishop of Gloucester, at Gloucester, and on the same day Dr. Taylor, rector of Hadleigh, at that place; on March 30, Farrar, bishop of St. David's at Carmarthen. On October 16, Bishops Ridley and Latimer were burned at Oxford, and finally at the same place, on March 22, 1556, was burned Archbishop Cranmer, for 23 years the primate of England. These executions of leading divines were accompanied by those of others, many of whom were illiterate persons, many also women. In the year 1555 were burned 75; in 1556, 83; in 1557, 77; in 1558, 51,—making a total of 286 in four years. So far, however, was this savage persecution from exterminating the reforming spirit from the church that when, on the welcome death of Queen Mary (1558), a new queen who favored the reformation succeeded, the whole of the clergy of England, with the exception of 189, accepted the change. The chief danger to the Church of England now arose, not from the cruelty of the Romanists, who were henceforth kept down with a strong hand, but from the contemptuous and insubordinate spirit developed among some who held reforming views. During their sojourn abroad the English exiles had become familiar with a type of reformed religion different from that which had been adopted by their own church, and they endeavored to press this upon the acceptance of the Church of England. It was seen that no change of importance, and certainly none in the Protestant direction, was to be expected in the formularies of that church. The queen was a lover of ceremonial. The primate (Parker) was a moderate man, but with no tendency to favor the foreign reformers, and inclined to exact obedience to law. The prayer-book was reviewed, but the only alterations made in it tended rather in the direction of increased ceremonial. The disciples of the foreign reformers, who soon obtained the name of Puritans, could not for a time believe that the ceremonial would be really enforced against them with vigor. But the queen was determined to compel the bishops to exercise discipline. When the Puritans discovered this, some of them formally separated from the church (1566); many more deliberately set themselves to devise plans for evading the laws and still keeping their benefices. The ministers who acted thus were strongly supported by a numerous party in the House of Commons, and only the untiring vigor and courage and the unfailing popularity of the queen saved the church from disruption. On the one hand Elizabeth constrained the bishops, often with the roughest menaces, to act. On the other she exercised a most dictatorial authority over parliament, and prevented its interference. Yet all this time the chief supporters of the Puritans were among her own favorites and ministers, Lord Leicester and Secretary Walsingham being the most conspicuous. So imperiously did the queen treat the chief ministers of the church, that at her demand the Star Chamber suspended the primate Grindal from the exercise of his office, and kept him in this enforced inaction till near his death. His offence was that he refused to obey the queen's orders to put down certain meetings and exercises of clergy and laity which were called prophesyings, and which were judged by the queen to have a tendency to encourage Puritanism. In the next primate, Archbishop Whitgift (1583), the queen found a man after her own mind—an unsparing disciplinarian, without the least tendency to undervalue the requirements of his position. Under Whitgift the subscription test was applied much more thoroughly than before, and in consequence the number of dissenters increased, while a complete conformity was produced in the church. The Puritans, despairing of obtaining legislative relief, and soured and embittered by the harsh treatment which they often experienced from the courts of ecclesiastical commission, allowed themselves to fall into the unjustifiable practice of writing railing libels against the bishops and clergy. These, which were known by the name of the Mar-Prelate libels, from a *nom de plume* assumed by one of the writers, became most bitter and fierce about the time of the great danger of the country from the Spanish Armada (1588). They were at length put down, and the writers of them punished with much severity; and by a law passed in 1593, which, making Puritanism an offence against the statute law, put the punishment of dissenters into the hands of the common law judges, the resistance to the church was well-nigh overcome. The chief of the Puritans now quitted England. The last ten years of Elizabeth's reign were comparatively free from religious contentions, and the church grew and flourished. In 1563 a review of the 42 articles agreed upon under Edward VI. had issued in the number being reduced to 39, the introduction of some new matter, and the exclusion of some previously adopted. The amended articles were accepted by the convocation of Canterbury and representatives of that of York, and, being ratified by the queen, were ordered to be subscribed by the whole of the clergy. An Act of Parliament making this compulsory was passed 1571. A second book of homilies was also now sent out by the convocation for the use of the clergy, and continual efforts were made to improve the learning of the parochial clergy, and to provide a larger supply of ministers competent to preach. During the reign of Elizabeth the theology of the Church of England in its reformed state acquired form and substance. Jewel's great work (*The Apology*) stated its case as against the Romanists. Whitgift, Bancroft, Hooker, and Bilson defended its teaching and discipline against the Puritans. The ground taken by this latter class of writers became gradually higher, until at length a divine right and claim were demanded for episcopacy. These higher views were readily accepted by the new sovereign James I., who, himself a theological writer, and thoroughly alienated from the Presbyterians by the rough treatment he had received at their hands, was ready to accord high authority to the church as he demanded it for the throne. His absolutist views of government soon embroiled him with the parliament, and the church shared in the unpopularity of the monarch. At the commencement of the reign of James, the Puritans entertained great expectations of obtaining changes favorable to their views. A petition, signed by nearly a thousand ministers who held with them, had been presented to the king, and a conference was arranged to be held at Hampton Court (January, 1604) to consider the points in dispute. Very small changes were the issue of this conference. It afforded an opportunity for the king to exhibit his theological skill, and to threaten the Puritans that they must expect rough treatment if they did not conform. Severe measures followed. Bancroft, the new primate (December, 1604), demanded not only the act of subscription to the formularies, but a declaration from the clergy that they made it *ex animo*. Through this many were deprived. Under Abbot, who succeeded him (1610), Calvinistic opinions were much favored in the church, and the king, who at that time appeared to hold these views, sent four English divines to represent him at the synod of Dort (1618). But towards the latter part of the reign a change both in politics and in the theology which found favor is very apparent. Arminian opinions began now to be freely advocated by divines, and the parliament, which was strongly opposed to these opinions and to the milder treatment of Romanists with which they were accompanied, began to make fierce personal assaults on the chief maintainers of them. Thus Bishops Neile and Harsnet, and Mr. Montagu, one of the king's chaplains, were attacked by the House of Commons. The accession of Charles, who was more strongly imbued with the opinions so distasteful to parliament than even his father, while it encouraged the court divines to bolder flights, made the temper of parliament more hostile both to them and the king. The angry dissolution of the parliament in 1629 was followed by an organized attempt on the part of the church rulers to preach up absolutist doctrines and the divine right of kings. The king's trusted adviser, Laud, was at the same time the autocratic ruler of the church, having, through the courts of High Commission and Star Chamber, an absolute power over both clergy and laity. Laud aspired not only to exact conformity, but to regulate the opinions and teaching of the whole body of clergy after the court pattern. He at the same time sought to improve the solemnity and decency of public worship, and to introduce many much-needed reforms into the church. But his measures were often taken without regard either to policy or justice, and, in consequence, a vast store of unpopularity was accumulated against him, which found vent when, early in 1640, during the sitting of the Short Parliament, a convocation met, and proceeded under royal license to make canons. An unfortunate mistake in the hasty wording of a canon, which, leaving an "etc." in the list of church officers to whom obedience was to be sworn, seemed to suggest the possibility of a trap laid for the unwary, caused a general ferment throughout the country. The unwise policy of continuing the convocation after the dissolution of parliament, in order that it might grant the king a benevolence, added fuel to the fire, and when, in November, 1640, the Long Parliament met, a most violent attack was at once made on Archbishop Laud and the clergy generally. Laud and two other bishops were committed to the Tower, awaiting articles of impeachment; the bishops were expelled from the House of Lords, the court of High Commission was taken away, and committees were appointed both in parliament and in the country to deal with the numerous petitions presented against the clergy. Soon the king and parliament were at open war, and the severest measures were directed against the clergy, who were mostly loyal to the king. In 1643 met an assembly of divines at Westminster, to which was committed the task of recasting the whole of the formularies and constitution of the church. They issued a directory for public worship, the use of which was enforced by law, while that of the Common Prayer was forbidden under severe penalties. The taking of the Scotch Solemn League and Covenant was enforced on all persons, and those clergy who refused it were at once deprived; others were ejected from their benefices by the committees established in various parts of the country, whose jurisdiction was summary and irresponsible. By these means a large proportion of the Episcopal clergy of England were ejected during the times of Presbyterian ascendency. Their archbishop had been beheaded as a traitor (1645) and many of their leading divines were in prison. Under Cromwell and the Independents the condition of the clergy did not improve. A body called the *triers* was appointed to test the qualifications of all ministers, and to exclude those judged unfit. In 1655 a very severe law forbade the clergy to use the Common Prayer in private houses, or to act as tutors or schoolmasters. They were thus reduced to the greatest distress and misery. The long-continued oppression to which the clergy had to submit during the Rebellion and Commonwealth naturally disposed them to harshness against the nonconformists at the restoration of the monarchy (1660). They resisted the demands upon them for concessions on the Puritanical side made at the Savoy Conference, and in the review of the prayer-book by convocation which followed, the changes made were by no means such as were likely to render it more acceptable to the objectors. Yet to this prayer-book a severe Act of Parliament required an immediate and unconditional assent and consent, as the condition of ministering in the church, requiring at the same time that all those who had not received episcopal orders should seek them, and that a declaration against the Covenant and a promise of non-resistance should be made. The effect of these requirements was to eject from ministering in the church about 2000 ministers (1662). The ejected were followed up and persecuted by various harsh measures, making it illegal for them to hold conventicles,—the parliament acting, as it seemed, from vindictive feeling, the king desiring to drive the nonconformists to despair, that they might seek from him the exercise of a dispensing power which he assumed to possess. His real object was to legalize Romanism, and in fact to carry out precisely the same policy which his brother afterwards adopted. The Protestant nonconformists for the most part refused to assist this policy, even to relieve themselves from persecution; and when James at length published the declaration for liberty of conscience (1687), they were found rather on the side of the church which had dealt harshly with them than on that of the king who offered them gifts. The trial of the seven bishops for withstanding the royal will, and upholding the supremacy of law, made the church immensely popular in the country. At the Revolution, by far the greater number of clergy elected to transfer their allegiance to William, but nine bishops and over 400 clergy refused the oaths. Among the bishops was the primate (Sancroft) and Bishop Ken, the most saintly prelate of his day. These seceders formed a separate church; they were, however, weakened by intestine quarrels, and, never obtaining any general support, they disappeared towards the end of the century. Among them were some of the most learned divines of the English Church, and their secession was a great blow to the church, which soon showed signs of running into an extreme latitudinarianism. The bitter feuds which prevailed between the two houses of the southern convocation all the time of William and Anne were due chiefly to political causes, the lower house being for the most part Jacobites, while the bishops were Whigs. It was mainly on this ground that in 1717 the Government suspended the action of convocation, which did not meet again for business until recent times.

During the 18th century a general remissness and negligence prevailed throughout the Church of England. Many of the clergy were Arians in their views; the sacredness of their office was but little recognized; the services in many churches were negligent and infrequent. The first reaction came from a band of earnest young clergymen and students at Oxford, of whom the two Wesleys and Whitefield are the best known. These men became travelling preachers, endeavoring to carry to every part of the land a stirring religious appeal. Their success was marvellous. Gradually their converts were organized, and arrangements made for their continued instruction. The church did not readily lend itself to the movement, and the new societies stepped aside from it into ground of their own. Whitefield became the leader of the Calvinistic Methodists, and the two Wesleys of the larger body, which favored Arminian views. The Methodist movement had operated very strongly on the English clergy, and towards the end of the century a considerable section of them, distinguished for their zeal and earnestness, were known as the Evangelical School. By their exertions the Church Missionary Society, designed to spread Christianity in Africa and the East, was founded; Bible and tract societies, Sunday schools, and other agencies were established. In the 19th century the growth of the Church of England has been remarkable. The school of Oxford Tract writers, which began to attract notice about 1838, gave prominence to the sacramental system and corporate powers of the church, and enlisted a new class of energies in its service. The zeal for building and restoring church fabrics has been so strong that within a period of thirty years a sum of £30,000,000 is known to have been contributed for this purpose. At the same time the church has aided materially in furnishing schoolhouses for all the villages in England, and in numberless other works of utility and charity. Its colonial and missionary episcopate now amounts to 60; while the daughter church in America has nearly the same number of prelates. The extension of the home episcopate is also proceeding, but at a slower rate. The two new sees of St. Albans and Truro were established in 1877. The Church of England can now number, as affiliated to her and accepting her use, a body of nearly two hundred prelates. In England her clergy amount to about 20,000; while, notwithstanding the complete toleration accorded to all dissenters since the Revolution, it is probable that considerably more than half the population of the country still acknowledges allegiance to the ancient church.[1]

II. *Formularies and Doctrines.*—The formularies of the English Church are translations in part from Latin and Greek rituals, which have been used fourteen or fifteen hundred years in the Christian church, and in part from the service book called the *Consultation* of Hermann, archbishop of Cologne, published in 1543. This was the work of Bucer and Melanchthon, but was grounded on a book previously published by Luther. Some portion of the formularies is the original composition of English divines. *Morning and Evening Services.*—These were chiefly compiled from the ancient services used at the Seven Hours of Prayer (nocturn-lauds or matins, prime, tierce, sext, nones, vespers, and compline). The services prescribed for these hours, after being shortened, had been brought together in a book called the Breviary (1073–1086). From the Breviary the English form was translated, the morning service being an abridgment of those prescribed for nocturn-lauds and matins, the evening of those prescribed for vespers and compline. The sentences, exhortation, confession, and absolution, which did not appear in the first reformed prayer-book, but were added in the second, were probably suggested by the forms adopted by some of the reformers. But the language of these also is carefully adopted from old liturgies. In place of the numerous short lections of the old services, which were sometimes taken from Scripture and sometimes from the legends of saints, two chapters of Scripture were appointed to be read at each service, by which both the Old Testament and the New were read through in regular course. Several occasional prayers and thanksgivings have been added for use in the morning and evening services at the different reviews of the prayer-book. The *litany* provided to be used, in addition to the morning and evening service, on Sundays, Wednesdays, and Fridays, was a translation of a very ancient form of service, which had been said processionally in the church ever since the time of St. Chrysostom. The English litany was translated by Cranmer, at the desire of Henry VIII., in 1544. Cranmer cut out such of the old invocations as did not accord with his reforming veiws, and inserted several portions from the litany issued in 1543 by Hermann, archbishop of Cologne. The form now used in the English Church has been slightly altered from that put forth in 1544. *Communion Service.*—The service to which by far the greatest importance was attached in the ancient church was that for holy communion, or the mass, as it came to be called from the last word of the Latin form. This is properly designated the *liturgy* or the service *par excellence*. The ancient Gallican liturgy had been adopted by the early British Church, and was found in use in Britain when Augustine came from Rome. Augustine, by permission of Pope Gregory, grafted some particulars of it on the Roman use which he introduced, and thus created an English liturgy, which, however, was not uniform throughout the land, but varied in different districts. This English liturgy was revised and reformed by Osmond, bishop of Salisbury, in 1087. The *Sarum Use*, thus created, was the ordinary eucharistic office for the English Church up to the time of the Reformation, but there existed also other uses, as those of York, Hereford, Exeter, Lincoln, Bangor, Aberdeen. One of the earliest measures taken in the reign of Edward VI. was to issue a communion office, which, leaving untouched the ancient Latin service, added to it an English service, by which communion was to be ministered to the people in both kinds (1548). This service was quickly superseded by the one contained in the prayer-book of 1549, which was put forth not as an addition to, but as a substitute for, the ancient Latin service. It was principally a translation of the Latin service, but contained also some additions taken from Hermann's *Consultation*. In 1552 the English communion service was rearranged and considerably altered, the recital of the ten commandments with the *kyrie eleison* being introduced, the words of adminstration altered, and other changes made to give it a more Protestant character. At the review of the prayer-book after the accession of Elizabeth, some changes were again made, and also at the last review in 1661. The English communion office as it stands at present is taken principally from the ancient liturgies, but also to a very considerable extent from reformed sources. The *baptismal offices* were compiled partly from the ancient forms, but chiefly from the offices in Archbishop Hermann's *Consultation*. The office for adult baptism was added in 1661. *The Catechism.*—This is altogether an office of the Reformation, no such form being found in the ancient service-books. The earlier part of the Catechism was originally inserted in the office for confirmation. The latter part, explaining the sacraments, was added after the Hampton Court conference, in compliance with the desire of the Puritans, and is the composition of Dr. Overall, then dean of St. Paul's. *Service for Confirmation.*—This service was brought into its present form at 1661, being then separated from the Catechism, with the previous explanatory rubric turned into a preface. It is due, as most of the English prayer-book, partly to the ancient Sarum office and partly to the *Consultation* of Archbishop Hermann. *Order of Matrimony.*—This service is taken almost entirely from the ancient office in the Sarum manual, as also is the office for the *Visitation of the Sick.* In 1552, when the practice of reserving the elements was forbidden, the service for the *Communion of the Sick* was added. The order for *Burial of the Dead* is a substitution for the mediæval offices of commendation, burial, mass for the dead, and office for the dead. It has been much changed at the several revisions of the prayer-book. The service for the *Churching of Women* is mainly derived from the mediæval office. The *Commination Service* is made up of the address composed by the reformers, and the prayers and suffrages anciently used in the church on the first day of Lent. The *Forms of Prayer to be used at Sea* were composed by Bishop Sanderson in 1601. The *Ordinal* did not form a part of the prayer-book of 1549, but was composed under the authority of a special Act of Parliament, which empowered six bishops and six other divines to draw up a fitting ordinal. This was presented to the council, February 28, 1550, and authorized. It was reviewed on the formation of the second prayer-book (1552), and considerably altered, and it was then appointed to form part of the prayer-book. The prayers are almost entirely new compositions, but the general arrangement of the services and the form and manner of conferring holy orders are the same as have been used for many centuries.

---

[1] Trustworthy *recent* statistics are not forthcoming.

The *Doctrines* of the English Church may be gathered to a great extent from the prayer-book, inasmuch as it was the custom of the reformers, who compiled that book, to introduce into all the services some words of exhortation and teaching as to the nature of the service; but it is more fully set forth and explained in the Articles and Homilies. The authority of these two books may be regarded as the same, inasmuch as the articles formally recognize and sanction the two books of homilies (art. 35). The first book of *Homilies* was set forth immediately after the accession of Edward VI., and authorized by his injunctions to be read in all churches at the mass. It was distributed to the different parishes by the royal visitors, together with an English version of the paraphrase of Erasmus. These homilies were probably mainly the work of Cranmer. The second book of homilies was set out with the sanction of convocation in 1562, but was not sanctioned by the queen for nearly a year afterwards. It was due, in part at least, to Bishop Cox, who wrote the preface to the volume, and was designed not to supersede but to supplement the earlier volume. The *Articles,* now in number 39, were originally 42. They were drawn up in the years 1551 and 1552 under the superintendence of Archbishop Cranmer and Bishop Ridley. These prelates made drafts of the articles proposed, and sent them to various divines of eminence, both English and foreign, inviting their suggestions thereon. The foundation of these drafts was a paper of articles agreed upon between Archbishop Cranmer and certain Lutheran divines who were in England in 1538 with a view of inducing Henry VIII. to adopt the Augsburg Confession. These were drawn as nearly as possible in the terms of the Augsburg Confession, and hence the resemblance between the articles of the Church of England and those of Augsburg. The 42 articles are supposed to have been approved by convocation in 1553, and ordered to be offered to the clergy for subscription. They were originally published together with a catechism drawn up by Bishop Poynet. On the accession of Elizabeth the bishops were anxious to republish the articles as a counter-statement to the dogmatic decrees of the Council of Trent. They were reviewed by the two houses of the convocation of Canterbury and some members of the northern convocation in 1563, and having been reduced to 39, and some additions and alterations made in them, were ratified by the queen, and subscribed first by the convocations, and then by all the clergy. In 1571 an Act of Parliament was passed making subscription to the articles necessary for all clergy as the condition of holding benefices; and the articles were again revised by convocation, and republished both in Latin and English. Together with the homilies and prayer-book, they form a complete exposition of the tenets of the English Church on all the main points both of doctrine and of discipline.

III. *Constitutional Status.*—The Church of England, or the *Spiritualty,* is one of the estates of the realm, and has an integral part in all legislation. It was on the ground of this constitutional position of the spiritualty that the famous protest was made, in 1641, as to the proceedings in the House of Lords in the absence of the bishops. This is pronounced by Mr. Hallam to be in accordance with the plainest principles of law (*Const. Hist.* i. 553). The church is accepted by the state as the religious body in England which is the legitimate possessor of all property set apart and devoted to religious uses, except the rights of some other religious body be specially expressed. It is the possessor of the ancient religious fabrics of the land and of the cemeteries attached to them. Its rights are carefully guarded by law, the incumbent of each parish being a corporation sole with certain duties and privileges. This position of the church towards the state is called its *Establishment.* It has arisen not from any definite Act of Parliament or the state, but from the gradual interpenetration of the state by the church, and from their having mutually grown up together.

The organization of the church in England was anterior to that of the state. When the country was still divided into separate kingdoms, the church had become one throughout the land, and looked generally to a common centre. This had been the work of Archbishop Theodore (668), who, by subdividing dioceses and establishing parish churches, had given form to the Christianity of the country. The church thus settled adapted itself to the civil organizations. The mark, vicus, or township became the sphere of duty of a single priest, the kingdom the diocese of a bishop, the whole land the province of the metropolitan; the rival archbishops head rival nationalities; the greater dioceses are divided on the lines of the earlier under-kingdoms; the shires become the archdeaconries, and the hundreds the deaneries of a later age. The archdeacon or bishop presided with the ealdorman and sheriff in the shire-mot; the parish priest led his people to the hundred-mot; the Witenagemot had its most distinct and permanent constituent in the clergy, bishops, and abbots. The church in England had thus from the very first a territorial organization; the land was divided and parcelled out to it, or rather by it. As the nation grew towards unity the territorial claims of the church became only the more firmly fixed; its right to *endowments,* which had in the first place been voluntarily given, was ratified and confirmed. The church was not endowed any more than established by any definite act of the state, but growing up together with the state it obtained sources of revenue from the piety of the faithful,—its position and its revenues being, not created, but defended and secured by law. The Church of England has always had the constitutional power, recognized by the law, of meeting in synod to discuss and settle matters touching the spiritualty,—the metropolitan of each province having his separate synod. After the Conquest, when secular and spiritual things were carefully divided one from the other, the metropolitan summoned the synod by his own authority, and it consisted merely of his suffragan bishops, with the prelates—that is to say, deans, abbots, archdeacons—without any representatives of the parochial clergy. These first appeared in a legatine synod at Westminster in 1255, but it was not till the time of Edward I. that the synods of the Church of England acquired that special organization which they have preserved ever since. The necessity that the clergy were then placed under of yielding to the king's heavy demands for taxes was the cause of the introduction of the representative system into the church. In the presence of more rigid demands for money payments, it was felt that those upon whom the taxes fell must have a voice in voting them. Accordingly the clergy of each diocese were now called upon to elect two proctors to sit in convocation. The first summons of elected representatives of the clergy to convocation bears date 1279. In 1295 the king, thinking that these representatives of the clergy sitting actually in parliament would be more amenable to pressure than when they sat in a house of their own, ordered two clergy from each diocese to be summoned to parliament. But the clergy shrank from this, and it soon fell into disuse. The convocations thus constituted under Edward I. consisted in each of the two provinces of Canterbury and York, first of the metropolitan, who was president; next of all diocesan bishops; then of all prelates,—that is to say, dignified clergy, deans, archdeacons, abbots; lastly, of representatives chosen by the chapters of the cathedrals and the clergy of the diocese. The numbers of these have varied at different times, and may be changed at the will of the president. These convocations voted all the money payments of the clergy to the crown, and also, before the time of Henry VIII., legislated for the clergy by canons without any check from the state. But in 1532 these bodies were constrained, by the great danger in which they then stood, to accept what was called the *Submission of the Clergy* to the crown. By this the archbishops abandoned their right of summoning their convocations independently, and undertook only to summon them on receiving the writ of the crown. They undertook also not to promulgate any canons save those which were ratified by the crown. This act of the clergy was embodied in an Act of Parliament and made law (1534), and it is under this law that the convocations of the two provinces have since met and acted. Their constitutional position at present is to be the advisers of the crown and parliament in all things spiritual and ecclesiastical, but they have no legislative power save in so far as what they have agreed upon may be made the substance of an Act of Parliament. The convocations have thus in many instances procured their determinations to become the law of the land, as, notably in the Act of Uniformity of 1662, and recently in the Shortened Service Act. But convocation may not only thus indirectly make statute law; it may also make, with the consent of the crown, canons which bind the clergy where they are not contrariant to statute law. The canon does not in any way come before parliament, but merely requires the royal license and approval to become valid. It was thus that the body of canons by which the clergy are at present governed were made in 1604. The meetings of convocation have always coincided with those of parliament, and only in two instances, in 1584 and 1640, has either convocation sat after the rising of parliament. In several instances the northern convocation, being the smaller, has consented to send representatives to the southern, and thus to constitute one synod. The convocations do not in reality consist of two houses, though they are thus divided for the purposes of discussion and voting, but only of one house each, the lower clergy being in fact the assessors of the bishops. In 1664 the clergy abandoned their right of taxing themselves in their convocations, and became subject to the general law of the land in this matter. In view of this concession they obtained the right of voting for members of parliament. In 1717 the lower house of the Canterbury convocation showing, as was thought, a turbulent spirit and a tendency to oppose the house of Hanover, the action of convocation was suspended, and it remained silent for one hundred and thirty-five years. The unconstitutional and oppressive character of this enforced silence of the spiritualty produced much discontent, and led in modern days to an organized attempt to overcome it. As convocation still continued to meet as a formality, and then to be immediately prorogued, opportunity was taken of its meeting, in February, 1852, to present to the lower house a large number of petitions praying for the revival of its action. They voted an address to the upper house enforcing the prayer of these petitions, and were allowed to present it. The action of this long inanimate body thus recommenced, and, the Government not seeing fit to oppose it, has gone on with increasing vigor ever since. The constitutional status of the Church of England has been considerably affected by various measures passed since the Restoration. The chief of these are the Toleration Act of William and Mary, the Act of Union with Scotland of Queen Anne, the Roman Catholic Emancipation Act, and the Jewish Disabilities Removal Act. Through the operation of these Acts the two houses of the legislature no longer consist entirely of members of the Church of England, although their right to legislate for that church remains the same. The effect of this is very perceptible in the course of modern legislation. The Church of England can no longer levy a compulsory rate on all occupiers for the maintenance of the church fabrics, as formerly. The exclusive right of performing the marriage service has also been taken from her, the completest equality between the religious bodies existing within the state being aimed at. This, so far as is consistent with the preservation of a certain prerogative to the church, as the church of the sovereign and one of the estates of the realm, and of the ancient church endowments, may be said to be the accepted principle of modern legislation.

IV. *Law.*—The Church of England is governed by a system of jurisprudence made up of three elements,—the Common Law, the Canon Law, the Statute Law. The first consists of customs, precedents, and judicial records; the second of all canons passed or accepted by English synods, which are not "contrariant to the laws, statutes, and customs of the realm," and which, if passed after the Act of Submission of the Clergy, 1534, have received the sanction of the crown; the third of Acts of Parliament relating to the church. Of these there is now a very large number. The laws relating to the church being of a mixed character, the judicial administration of those laws is assigned to various tribunals, some of a purely ecclesiastical kind, some of a purely secular kind, and some in which the ecclesiastical and secular elements are combined. All questions of civil rights are within the jurisdiction of the secular courts. Questions touching the orthodoxy of the clergy, their conduct in their ministrations, and their morals are subject to the jurisdiction of the bishops, with the right of appeal from a lower to a higher court, and ultimately to the sovereign in council. The ordinary ecclesiastical tribunal of first instance is the consistory court of each diocese. Of this the bishop is *judex ordinarius*, but he does not preside in it in person, but by his chancellor. In the case of criminal offences charged against any of the clergy, the bishop's mode of proceeding is regulated by recent legislation, which has substituted another tribunal for the ancient diocesan court. This is contained in the Act 3 and 4 Vict., c. 86, entitled "An Act for better enforcing Church Discipline." Under this Act the bishop may either proceed against the accused clerk himself, by issuing a commission to five persons to inquire whether there is a case, and then, if this is found, proceeding to try it with three assessors; or he may send the case at once to the provincial court, where it will be tried before the Dean of the Arches. A further regulation of procedure in the case of clerks charged with offences against the rubrics of the prayer-book has been made by the Public Worship Regulation Act of 1876.

ENGLISH BIBLE. The history of the vernacular Bible of the English race resolves itself into two distinctly marked periods,—the one being that of Manuscript Bibles, which were direct translations from the Latin Vulgate, the other that of Printed Bibles, which were, more or less completely, translations from the original Hebrew and Greek of the Old and New Testaments.

The Manuscript Bible.

As far back as the English language can be followed, there are traces of the work of English translators of the

Scriptures.[1] St. Aidan, bishop of Lindisfarne in the first half of the 7th century (died 651 A. D.), is said by Bede to have employed those who were about him, laymen as well as clergy, in reading and learning the Scriptures, especially the Psalms; and the laymen of Northumbria were not likely to understand any but their native tongue. A little later Cædmon, a lay monk of Whitby (died 680), whose gifts as a poet had been discovered while he was a cow-herd on the neighboring downs, composed a metrical version of several parts of the Old and New Testaments from English translations which had been made for him by monks who understood the Latin Vulgate. Rather later still, Eadfrith, bishop of Lindisfarne (died 721), is said, on some authority known to Archbishop Ussher (*Works*, xii. 282), to have translated most of the books of the Bible; and similar traditions are handed down respecting the Venerable Bede (died 735), Alcuin (died 804), and King Alfred (died 901). The earliest relic of such work that actually remains extant is an English Psalter, the first fifty Psalms of which are in prose and the rest in verse, which was translated by St. Aldhelm, long abbot of Malmesbury, and at his death (709) bishop of Sherborne, and of which a copy is preserved in the National Library at Paris. This Psalter was printed at Oxford, under the editorship of Thorpe, in 1835, and is one of the earliest monuments of the English language.

Aldhelm's Psalter.

The Lindisfarne Gospels.

Next in date comes a volume known as the Lindisfarne or St. Cuthbert's Evangelistarium. This beautiful volume, which formerly belonged to the dean and chapter of Durham, but is now preserved in the British Museum (Nero D. iv.), was written in Latin by Eadfrith about 680, and illuminated by Ethelwold, afterwards (724–740) bishop of Lindisfarne. At a later date an interlinear English translation was added by Ealdred, probably the monk who afterwards became (957–968) bishop of Chester-le-Street. The Lindisfarne Gospels were edited, with a learned introduction, by Bouterwek in 1857, and also by Stevenson and Waring for the Surtees Society in 1854–65.

The Rushworth Gospels.

Of a little later date is a similar volume, known as the Rushworth Gospels, which is preserved in the Bodleian Library (Auct. D. 2, 19). This manuscript was originally written in Latin by MacRegol, an Irish scribe, about 820, and the interlinear English version was added about 80 or 100 years afterwards by a scribe named Owen and a priest of Harewood named Færman. The three later gospels are so nearly identical with those of the Lindisfarne book as to show that the translation contained in the latter represents a publicly circulated version. The Rushworth Gospels have also been printed by the Surtees Society.

Ælfric's Heptateuch.

There was in circulation, too, in the 10th century, a translation of the first seven books of the Old Testament, which had been made by Ælfric, who was during the later part of his life (994–1005) archbishop of Canterbury. These seven books were probably, however, part only of a much larger work, for translations of the books of Kings, Esther, Job, Judith, the Maccabees, and of the four gospels, also exist, which are of the same date, and are supposed to be from the same pen. Copies of the Heptateuch exist in the British Museum (Claud. B. iv.), and in the Bodleian Library (Laud. 509) a copy of the gospels being preserved in the library of Corpus Christi College, Cambridge. The Heptateuch was printed by Edward Thwaites in 1698.

In addition to the above, there are also many copies of the "Anglo-Saxon" Psalter and of the Gospels in the British Museum, in the libraries of Oxford and Cambridge, and elsewhere, some of which are written in between the lines of the Latin, and others of which are, like Ælfric's Heptateuch, etc., independent works. Such manuscripts are found of as late a date as the end of the 12th century, showing that the more ancient form of the English language was in use long after the Norman Conquest, and even when the transition was far advanced from "Anglo-Saxon" to the mediæval English of Chaucer. The general character of the older English may be seen by the following specimen, taken from Ælfric's Heptateuch, the comparison with modern English being made easy by a parallel version:

GEN. XXXVII. 5–11.

TENTH CENTURY.	MODERN.
. . . hine hatedon the swithor. &	. . . him hated the more. And
he cwæth to him, Gehirath min	he quoth to them, Hear my
swefen the me mætte. Me thuhte	dream that me met. Me thought
tht we bundon sceafas on æcere,	that we bounden sheaves in the acre,
& tht min sceaf arist, & stode	and that mine sheaf arised, and stood
uprihte onmiddan eowrum sceafum,	upright amid your sheaves,
& eowre gilmas stodon ymbutan	and your yelms [bundles] stood about
& abugon to minum sceafe.	and bowed to mine sheaf.
Tha cwædon his gebrothru,	Then said his brethren,
Cwist thu? bist thu ure	Sayest thou? beest thou our
cyning, oththe beoth we thine	king, either be we thine
hyr men? Witodlice thurh this	hire-men? Wherefore through his
swefn & thurh thas spræca hig	dream and through his speeches they
hine hatedon. & hæfdon andan to	him hated and had anger to
him. Other swefen hine mætte,	him. Other dream him met,
& he rehte tht his brothrum. &	and he told that his brethren, and
cwth, Ic geseah on swefne swilce	quoth, I saw in a dream as it were
sunne & mona & endleofun	sun and moon and eleven
steorran, & ealle abugon me. Tha	stars, and all bowed to me. When
he tht his fæder & his brothrum	he that his father and his brethren
rehte, tha threatode se fæder hine	told, then threatened his father him,
& cwæth, Hwat sceal this swefen	and quoth, What shall this dream
beon the thu gesawe? Sceolon	be that thou sawest? Shall
we abugan the, ic & thin modur	we bow to thee, I and thine mother
& thine gebrothru? Witodlice	and thy brethren? Wherefore
his gebrothru yrsodon swithe . . .	his brethren were angry with . . .

The English which was spoken before the Conquest underwent much change, however, during the reigns of the Norman and Angevin kings; and although the reproduction of the older translations shows that there were some Englishmen who still used their language in its ancient form, yet there can be no doubt that many of the old words had become obsolete by the time of the Plantagenets, and that the vernacular tongue of the country had been so altered by its contact with the French spoken by the upper classes as to make new translations of the Scriptures necessary. Of such new translations Archbishop Cranmer writes in his preface to the authorized version of 1540. The Holy Bible was, he says, "translated and read in the Saxons' tongue, which at that time was our mother tongue," many hundred years before the date at which he was writing, "whereof there remaineth yet divers copies, found in old abbeys, of such antique manner of writing and speaking that few men now been able to read and understand them. And when this language waxed old and out of common usage, because folk should not lack the fruit of reading it was again translated into the newer language, whereof yet also many copies remain, and be daily found." Sir Thomas More also wrote that "the whole Bible was, long before Wickliffe's days, by virtuous and well-learned men, translated into the English tongue, and by good and godly people with devotion and soberness well and reverently read" (More's *Dial.*, iii. 14). Similar evidence is given by Foxe the martyrologist, who says in his dedication to an edition of the Anglo-Saxon gospels, "If histories be well examined, we shall find both before the Conquest and after, as well before John Wickliffe was born as since, the whole body of the Scriptures by sundry men translated into our country tongue." But as of the earlier period so of this, there are none but fragmentary remains, the "many copies" which remained when Cranmer wrote in 1540 having doubtless disappeared in the vast and ruthless destruction of libraries which took place within a few years after that date.[2] There are, however, two English versions of the Psalter still remaining which were made early in the 14th century, together with many abstracts and metrical paraphrases of particular books of the Bible, translations of the epistles and gospels used in divine service, paraphrases of gospel lessons, narratives of the Passion and Resurrection of our Lord, and other means for familiarizing the people with Holy Scripture. It was also the custom of mediæval preachers and writers to give their own English version of any text which they quoted, not resorting as in later times to a commonly received translation; and a very curious illustration of this fact is found in the prologue to the Wickliffite Bible, where, of the many quotations made from the Scriptures, none are taken from the English version to which it forms the preface, but all are translated directly from the Vulgate. The same fact is observable in the works of Chaucer and of Wickliffe himself, neither of them using the Wickliffite version, though their works contain numerous quotations from Scripture translated into English.

---

[1] There seem indeed to have been copies of a vernacular version in the earlier language of the country, for Gildas writes in the beginning of his history that, when English martyrs gave up their lives for Christianity during the Diocletian persecution in the beginning of the 4th century, "all the copies of the Holy Scriptures which could be found were burned in the streets."

[2] Bale writes in 1549, "I judge this to be true, and utter it with heaviness, that neither the Britons under the Romans and Saxons, nor yet the English people under the Danes and Normans, had ever such damage of their learned monuments as we have seen in our time" (Bale's Declaration upon Leland's *Journal*). About that time, among hundreds of other libraries, those of the city of London and of the university of Oxford entirely disappeared, the very book shelves of the latter being sold for firewood.

Schorham's Psalter.

Of the two Psalters mentioned above, the earlier one was translated by William de Schorham, who was vicar of Chart Sutton in Kent in the year 1320. One copy is preserved in the British Museum (Add. MS. 17,376), and two others are in the library of Trinity College, Dublin. The other version was made by Richard Rolle, a chantry priest and hermit of Hampole, near Doncaster (died 1349). Among many works that he wrote was a Latin commentary on the Psalms, and on his being persuaded to re-write this in English, an English version of the Psalms was incorporated with it in the same way as the Latin had been in the original work. "In this werke," wrote the author—

Rolle of Hampole's Psalter.

> "I seke no straunge Ynglys, but lightest and communest, & swilk is moste lyk unto the Latyne, so that thai yt knawes noght ye Latyne be the Ynglys may com to many Latyne wordis. In ye translacion I feloghe the letter als-mekille as I may, and ther I fynd no propre Ynglys, I feloghe ye wit of ye wordis, so that thai that schulen rede it them thar not drede errying."

The commentary of Hampole, as the author is frequently called, was very extensively circulated, and many copies of it exist. It was also printed at Cologne in the year 1536.

Treading worthily in the footsteps of these and many other worthy predecessors, come the translators of the two noble 14th century versions, which were long regarded as the exclusive work of John Wickliffe, and were thus always associated with his name (see WICKLIFFE). The first of these two versions was completed about 1384, the year of Wickliffe's death, and may be distinguished by the names of the principal translators, as Hereford and Wickliffe's version. The second was completed about 1388, and for the same reason may be called Purvey's version.

The Hereford and Wickliffe Bible, 1384.

Wickliffe's earliest work was of the same nature as that of Rolle, being a commentary on the book of Revelation, which he is supposed to have written in 1352. This was followed in 1360 by a commentary on the gospels, consisting chiefly of passages from the fathers translated into English and placed beside an English version of the gospels. It is this translation of the gospels alone which can be certainly identified as the work of Wickliffe in the Bible which goes by his name; but Sir Frederick Madden says, in his preface to the Wickliffite versions, that the Epistles, Acts, and Apocalypse "might probably be the work of Wickliffe himself; at least the similarity of style between the gospels and the other parts favors the supposition." The Old Testament and Apocryphal books were translated principally by Nicolas de Hereford, of Queen's College, Oxford, at one time vice-chancellor of the university, and afterwards a canon of Hereford. It is to be observed, however, that the translation of the Psalms in Hereford's Old Testament is undoubtedly based upon that of the Hampole Psalter. The original manuscript of Hereford's translation, with his alterations and corrections, is preserved in the Bodleian Library (Bodl. 959). It extends only as far as Baruch iii. 19, and it is supposed that his work was interrupted in the middle of the year 1382 by a summons to appear before convocation in London, and by a subsequent appeal which he made to Rome, and which ended in an imprisonment there. A contemporary copy of his manuscript also exists in the Bodleian (Douce 369), which shows the further growth of this version. At the place where Hereford left off, a note is inserted stating the fact in Latin, "Explicit translationem Nicholay de Herford," and the remaining books of the Old Testament, Ezekiel, Daniel, the twelve minor prophets, and the two books of Maccabees, are added by another and unknown hand. The Bible was then completed by extracting the text of the gospels from Wickliffe's commentary, and adding to it a new translation of the rest of the New Testament. Copies of this Bible are rare, far the greater number of the copies of the "Wickliffite Bible" being of the later version, now to be described.

Purvey's version, 1388.

Although there is enough verbal resemblance between this later version and that of Hereford and Wickliffe to suggest that it is a revision of the latter rather than a new translation, the account given of his work by Purvey himself says nothing about such a revision, and represents it as an independent version.

> "For these reasons and other," he wrote in his prologue or preface, "with common charity to save all men in our realm which God will have saved, a simple creature hath translated the Bible out of Latin into English. First, this simple creature had much travail, with divers fellows and helpers, to gather many old Bibles, and other doctors, and common glosses, and to make one Latin Bible some deal true: and then to study it of the new, the text with the gloss and other doctors as he might get, and specially Lyra on the Old Testament that helped him full much in this work: the third time to counsel with old grammarians and old divines of hard words and hard senses how they might best be understood and translated: the fourth time, to translate as clearly as he could to the sense, and to have many good fellows and cunning at the correcting of the translation."

These words imply a labor of some years, and as Purvey makes no allusion whatever to any other translation of his own time, it is reasonable to suppose that he went to his task without any knowledge that a similar work was being done by contemporaries. But although he says much in his prologue respecting the manner in which his work of translation had been done, Purvey gives no information respecting the date at which he was writing. He lived on as late as the year 1427, leading an unsettled life, and suffering imprisonment for his opinions, which he recanted at St. Paul's Cross in 1400; but it is supposed that his translation was completed by about the year 1388. About 150 copies of Purvey's version are known to be still in existence, some of them beautifully illuminated and beautifully bound, but they all appear to have been written before 1430.[1]

The following specimen of the later version (John xi. 1–13) will show that its language is not very far removed from that of the present day:—

> "And ther was a sijk man, Lazarus of Bethanye, of the castel of Marie and Martha hise sistris. And it was Marye, which anoyntide the Lord with oynement, and wipte hise feet with hir heeris, whos brother Lazarus was sijk. Therefor hise sistris senten to hym, and seide, Lord, lo! he whom thou louest is sijk. And Jhesus herde, and seide to hem, This syknesse is not to the deth, but for the glorie of God, that mannus sone be glorified bi him. And Jhesus louyde Martha and hir sistir Marie, and Lazarus. Therfor whanne Jhesus herde that he was sijk, thanne he dwellide in the same place twei daies. And after these thingis he seide to hise disciplis, Go we eft in to Judee. The disciplis seien to hym, Maister, now the Jewis soughten for to stoone thee, and eft goist thou thidir? Jhesus answerde, whether ther ben not twelue ouris of the dai? If ony man wandre in the dai he hirtith not, for he seeth the light of this world. But if he wandre in the night, he stomblith, for light is not in him. He seith these thingis, and aftir these thingis he seith to him Lazarus oure freend, slepith, but Y go to reise hym fro sleep. Therefor hise disciplis seiden: Lord, if he slepith, he schal be saaf. But Jhesus hadde seid of his deth; but thei gessiden that he seide of slepyng of sleep. Thaune therefor Jhesus seide to hem opynli, Lazarus is dead; and Y haue ioye for you, that ye bileue, for Y was not there; but go we to hym."

This was the latest English dress in which the Holy Bible appeared during those seven centuries or more in which it was a reproduction of the Latin Vulgate, and before the invention of printing was brought to bear on the circulation of the Scriptures.

The Printed Bible.

It is singular that while France, Spain, and Italy each possessed vernacular Bibles before Henry VIII. began his reign, and Germany had seventeen editions of the Scriptures printed and widely circulated in the German language before Luther was known, yet no English printer attempted to put the familiar English Bible into type. No part of the Bible was printed in English before 1526, no complete Bible before 1535, and none in England before 1538.[2]

---

[1] The earlier and the later of these two "Wickliffite" versions of the Bible were printed in parallel columns in four quarto volumes in 1850, under the editorship of the Rev. Josiah Forshall and Sir Frederick Madden. Previously to that time the New Testament of Purvey had been printed by the Rev. John Lewis, in folio, in 1731, and again by the Rev. H. H. Baber, in quarto, in 1810; it was also printed in Bagster's English *Hexapla*, in 1841. Of the earlier version the Song of Solomon was printed, and many detached portions of other books, in Dr. Adam Clarke's *Commentary* in 1810, and the New Testament by Mr. Lea Wilson in 1848.

[2] It should be mentioned, however, that the popular *Golden Legend* contained nearly the whole of the Pentateuch and the Gospel narrative in English, and that this was printed by Caxton in 1493.

William Tyndale.

The first fruits of the printing press as regards the English Bible were the New Testament and the Pentateuch of William Tyndale (1484–1536), which were translated and printed abroad between the years 1524 and 1530. Demaus, in his life of Tyndale, gives reasons for coming to the conclusion that he first formed the intention of translating the Bible "about the end of 1522 or beginning of 1523" (Demaus's *Life of Tyndale*, p. 63, *n.*), at which time he was engaged, as a clergyman of the mature age of thirty-eight, in teaching the children of Sir John Walsh of Little Sodbury, in Gloucestershire, the eldest of whom was only six or seven years of age (*ibid.*, p. 37). Early in 1523 he left Sodbury and went up to London, where he was engaged for six months as chantry priest to the family of Humphrey Monmouth, a city merchant, whose residence was near the Tower. About the end of 1523 Tyndale endeavored to obtain a home in the household of the learned Tunstall, then bishop of London, it being the custom for bishops of those days to surround themselves with a small court of scholars, chaplains, and assistants, who were maintained out of the revenues of their sees. The bishop was already overburdened, however, with dependents, and though Tyndale carried a translation of an oration of Isocrates in his hand as evidence of his Greek scholarship, he said nothing about his contemplated translation of the New Testament; and being, as he says, "evil-favored in this world, and without grace in the sight of men, speechless and rude, dull and slow-witted," it is no wonder that the bishop recommended him kindly "to seek in London, where he said I could not lack a service," such as that in which he had already been engaged. Thus it happened that Tyndale left England and went to Germany early in the year 1524, an unknown, an unsuccessful, and a disappointed man, and yet one whose work during the next two years was to be honored by every succeeding generation of his countrymen, and to give his name a conspicuous place among those of the Reformers (see TYNDALE).

Tyndale's New Testament, 1526.

The six months which Tyndale had spent in Monmouth's house were probably occupied in preparing himself for his greater undertaking by the translation of the *Enchiridion* of Erasmus, and "another little treatise," which he left in charge of the merchant. On landing at Hamburg he "got him straight to Luther" at Wittenberg, according to the unanimous testimony of his contemporaries, and there the work of translation must have been commenced immediately; for, notwithstanding a long journey by land to Cologne, a sufficiently long residence there for the printing of St. Matthew and St. Mark in one edition, a removal to Worms and the time occupied there in printing another edition of the whole New Testament, the translation was widely circulated in England within less than two years of Tyndale's arrival in Germany. Whether he was in any way assisted by Luther is still a disputed point, as, although Tyndale translated and adapted Luther's prefaces to the several books, and also many of his marginal annotations or "glosses," this does not necessarily indicate any personal influence of the great Reformer, and there is no historical evidence to show that there was any intercourse between them. What is more certain is that Tyndale was assisted by a Franciscan friar named William Roye, and by "a faithful companion" whose name he does not give, "till that was ended which I could not do alone without one both to write and to help me to compare the texts together." When the work of translation was sufficiently advanced, or when it was completed, Tyndale and Roye removed to Cologne, where it was put to press by Peter Quentel, that printer being chosen perhaps of all in Germany because his partners, the Byrckmans, were booksellers in London, and would thus be able to set the book in circulation. The printers began an impression of 3000 in a small quarto size, but the printing had only proceeded as far as the tenth sheet, when any further progress was prohibited by the authorities of the city, Tyndale and Roye being considered as "two English apostates who had been some time at Wittenberg," and whose work could not but therefore be an evil one. The two Englishmen managed, however, to escape higher up the Rhine to Worms, where Luther's influence was much stronger than at Cologne, and they succeeded in carrying with them some, or all, of the 20,000 or 30,000 sheets which had been printed. Instead of completing Quentel's work, Peter Schœffer, the Worms printer, was employed to print another impression of 3000 in a small octavo size, without prefaces to the books or annotations in the margin, and only having an address "To the Reder" at the end in addition to the New Testament text itself. Both impressions arrived in England early in the summer of 1526, less than two years after Tyndale had quitted its shores, and were put into circulation with more or less secrecy as opportunity offered. The imperfect or quarto impression printed at Cologne is sometimes spoken of by contemporaries as "Matthew and Mark in English" or "the chapters of Matthew;" and Dr. Robert Ridley, uncle to Bishop Ridley, writes of "the common and vulgar translation of the New Testament into English, done by Mr. William Hichyns, otherwise called Mr. W. Tyndale, and friar William Roye," distinguishing the two impressions by mentioning "their commentaries and annotations in Matthew and Mark in the first print, as well as their preface," or address to the reader, "in the second print" (Demaus's *Life of Tyndale*, p. 105). But both these impressions are now so rare that of the first only sixty-two pages of one copy are known (Brit. Mus., *Grenv.* 12,179), and of the second only one imperfect copy, which is in the library of St. Paul's Cathedral, and one perfect copy which is in that of the Baptist college at Bristol. Tyndale's work was, however, reprinted surreptitiously at Antwerp three times before 1528, and again under the editorship of George Joye,[1] one of his former friends, in August, 1534. In November, 1534, Tyndale himself brought out a revised edition, with translations added of all the Sarum Epistles and Gospels which were taken from the Old Testament and the Apocryphal books, this edition being also printed at Antwerp by Martin Emperour. In the following year Tyndale once more set forth a revised edition, "fyneshed in the yere of oure Lorde God A.M.D. and XXXV.;" and this is supposed to have been revised by him while in prison in the castle of Vilvorde, being the last of his labors in connection with the English Bible. His execution took place on October 6, 1536, and about the same time a small folio reprint of his revised edition of 1534 was brought out in England by Berthelet, the king's printer.[2] In later years twenty-nine editions of Tyndale's New Testament were published, without reckoning modern reprints.

Tyndale's Pentateuch, 1530.

Three years and a half after the publication of his English New Testament, on January 17, 1530, Tyndale published his English Pentateuch. That he did not know anything of Hebrew when he left England in 1524 seems certain (Eadie's *Eng. Bible*, i. 208), while translation of the New Testament and seeing it through the press in less than two years could scarcely have left him time for acquiring a knowledge of it before 1526. In May, 1528, he published two works, *The Parable of the Wicked Mammon* and *The Obedience of a Christian Man*, and was at the same time engaged in writing *The Practice of Prelates*, a work of considerable size. Between the middle of 1526 and the middle of 1529 it was impossible for any man so fully employed to learn Hebrew so thoroughly as to be able to produce at the end of that time an original translation of the Pentateuch, and the opinion that Tyndale did so cannot be maintained in the face of such historical facts. Frith, who joined him at Marburg in 1528, may have been a Hebrew scholar, and from him Tyndale may have received assistance in the work. But Foxe states that when Tyndale had completed his translation, he was shipwrecked on the coast of Holland, losing it and all his books, that he sailed by another ship to Hamburg, and that there Coverdale "helped him in the translating of the whole five books of Moses, from Easter till December, in the house of a worshipful widow, Mistress Margaret Van Emmerson, 1529 A.D., a great sweating sickness being at the same time in the town. So having despatched his business at Hamburg he returned afterwards to Antwerp again." (Foxe's *Acts and Mon.*, v. 120, ed. 1846.)

---

[1] Joye was a rival translator, and although he and Tyndale had once been friends, they afterwards wrote against each other in exceedingly bitter language. Joye published an English Psalter at Strasburg in 1530, a translation of Isaiah in 1531, and one of Jeremiah in 1534. Tyndale says that he had printed two leaves of a translation of Genesis, and sent copies of it to the king and queen, with a request that he might receive license to go through the whole Bible. But, although he survived until 1553, Joye's name does not appear again in association with the work of translation.

[2] The type and the woodcut border of the title-page were immediately afterwards used by Berthelet in printing the *Institution of a Christian Man*, a work of considerable size, which was published in July, 1537. The only copy known of this edition of Tyndale's translation is in the Bodleian Library.

But there is so much in common between the language of Tyndale's Pentateuch and that of his predecessor Purvey, that it is evident the old English Bible, already so familiar to Englishmen, was made the foundation of the new work. Tyndale himself may have had sufficient knowledge of Hebrew to have corrected some of the more glaring errors of the Wickliffite version, especially by the help of Luther's German Bible; or he may, as Foxe alleges, have been assisted by Coverdale, who had a competent acquaintance with the language. However this may have been, the English Pentateuch was so rapidly placed in the printer's hands, notwithstanding Tyndale's other literary occupations, that it came from the press with the colophon "Emprented at Marlborrow, in the land of Hesse, by me, Hans Luft, the yere of oure Lorde MCCCCCXXX., the xvii. daye of January," and was shortly afterwards put in circulation in England. Of this work several copies are still in existence, but the only perfect one known is in the British Museum. In the following year Tyndale published a translation of Jonah, the only copy known of which is in the library of the marquis of Bristol at Ixworth; and in 1534 he brought out a revised edition of the book of Genesis, which was the last of his labors in connection with the Old Testament.

The Coverdale Bible, 1535.

Meanwhile a complete English Bible was being prepared by Miles Coverdale (1485–1565), an Augustinian friar who was afterwards for a few years (1551–1555) bishop of Exeter. As the printing of the whole Bible must have occupied the printers for many months, and probably did occupy them for several years, and as that printing was finished on October 4, 1535, it is evident that Coverdale must have been engaged on the preparation of the work for the press at almost as early a date as Tyndale. There is, indeed, a correspondence extant between Cromwell when he was secretary to Wolsey and Coverdale when he was resident at the Augustinian priory at Cambridge, which shows that the work was in hand in the year 1527. But the book was printed abroad, and Foxe's statement shows that Coverdale was at Antwerp in 1529, so that probably the greater part of the translation was made, like that of Tyndale, out of England. Mr. Henry Stevens has pointed out that, in a biographical notice of Emanuel Van Meteren appended to his history of Belgium by Simon Ruytinck, the latter states that Jacob Van Meteren, the father of Emanuel, had manifested great zeal in producing at Antwerp a translation of the Bible into English "for the advancement of the kingdom of Christ in England, and for this purpose he employed a certain learned scholar named Miles Coverdale." As Van Meteren had been taught the art of printing in his youth, it seems very probable that he exercised his zeal in the matter by undertaking the cost of printing the work as well as that of remunerating the translator. The woodcuts in Coverdale's Bible, but not the type, have been traced up to James Nicolson, printer in St. Thomas' Hospital in 1535, and Mr. Stevens connects him with the book and with Van Meteren in the following manner: "The London bookbinders and stationers, finding the market filled with foreign books, especially Testaments, made complaint in 1533–34, and petitioned for relief; in consequence of which a statute was passed compelling foreigners to sell their editions entire to some London stationer, in sheets, so that the binders might not suffer. This new law was to come into operation about the beginning of 1535. In consequence of this law, Jacob Van Meteren, as his Bible approached completion, was obliged to come to London to sell the edition. We have reason to believe that he sold it to James Nicolson of Southwark, who not only bought the entire edition, but the woodcuts, and probably the punches and type; but if the latter, they were doubtless lost in transmission, as they have never turned up in any shape since. All the copies of the Coverdale Bible in the original condition, as far as we know, have appeared in English binding, thus confirming this law of 1534." (*Caxton Celebr. Catal.*, pp. 88, 89.) It is now evident that Coverdale refers partly, at least, to Jacob Van Meteren when he says in his dedication: "Trusting in His infinite goodness that He would bring my simple and rude labor herein to good effect, therefore, as the Holy Ghost moved other men to do the cost hereof, so was I boldened in God to labor in the same." But although the discovery of Ruytinck's statement seems to show conclusively that Coverdale completed his translation, after Wolsey's fall, at the cost of Van Meteren, and at Antwerp instead of Cambridge, he so far picked up the semi-official clue which he had dropped for a time that he published it with a dedication to King Henry VIII., which occupies five pages, and is subscribed "youre Grace's humble subiecte and daylye oratour, Myles Coverdale."

This first of all printed English Bibles is a small folio volume measuring 11¾ by 8 inches, and bears the title—"Biblia. The Bible, that is, the Holy Scripture of the Olde and New Testament, faithfully and truly translated out of Douche and Latyn in to Englyshe, M.D.XXXV.," with the texts 2 Thes. iii. 1, Col. iii. 16, Josh. i. 8 underneath. The colophon is "Prynted in the yeare of our Lord M.D. XXXV., and fynished the fourth daye of October." The title-page was, however, for some reason cancelled immediately, and only one perfect copy of it is known. The new title-page with the same date, 1535, merely says, "faythfully translated in to Englyshe," omitting the words "and truly" and "out of Douche and Latyn." A second edition in folio, "newly oversene and corrected," was printed by Nicolson, with English type, in 1537; and also, in the same year, a third edition in quarto. On the title-page of the latter were added the words, "set forth with the Kynge's moost gracious licence."

The words at first printed on the title-page, and subsequently cancelled, had been doubtless placed there by mistake. In his dedication to the king, Coverdale says, "I have with a clear conscience purely and faithfully translated this out of five sundry interpreters, having only the manifest truth of the Scriptures before mine eyes." These "five interpreters" would naturally be Bibles in Hebrew, Greek, Latin, German, and English,—the English being that with which Coverdale must long have been familiar, the Wickliffite version, together with the recent translations of Tyndale.[1]

It should be added that Coverdale's Bible was the first in which the non-canonical books were collected out of the body of the Old Testament and placed by themselves at the end of it under a separate title. Coverdale entitled them "The Volume of the Book called Hagiographa," but this was changed to "Apocrypha" in the Great Bible of 1549.

Matthew's Bible, 1537.

The large sale of the New Testaments of Tyndale, and the success of Coverdale's Bible, showed the London booksellers that a new and profitable branch of business was opened out to them, and they soon began to avail themselves of its advantages. Richard Grafton and Edward Whitchurch, afterwards the king's printers, were the first in the field, bringing out a fine and full-sized folio in 1537, the same year in which Coverdale's second edition appeared, "truely and purely translated into English by Thomas Matthew." This volume was prepared for the press at Antwerp by "John Rogers *alias* Matthew," who was for some time (1534–1548) chaplain to the Merchant Adventurers there, whose wife, Adriana Pratt, was a relative of Jacob Van Meteren, and who returning to England in 1548, became canon of St. Paul's, and was the first of the sufferers at Smithfield in the reign of Queen Mary. It was not, however, "translated . . . by Thomas Matthew," but was a compilation from the translations of Tyndale and Coverdale, made under the editorship of Rogers, who revised them to some extent before sending them to press. The Pentateuch was printed from Tyndale's translation of 1531; and the books from Joshua to the end of Chronicles are said to have been translated by Tyndale also—a tradition corroborated by internal evidence (Westcott's *Eng. Bible*, p. 224)—and to have been left by him in the hands of Rogers. From Ezra to Malachi the translation is taken from Coverdale, as is also that of the Apocryphal books. The New Testament is a revised copy of Tyndale's edition of 1535. Thus, as the book consists of 1100 pages, more than half, or 600 pages, must be assigned to Tyndale, and the remaining 500 pages to Coverdale.

It is probable that the Matthew Bible was printed by Antwerp booksellers as a speculation, in the same manner as the New Testament had been brought out under the editorship of Joye by the "widowe of Christoffel of Endhoven," in 1534. But while it was at the press, Grafton and Whitchurch appear to have stepped in with an offer to purchase the work, their initials being found on a title-page which is placed before the prophecy of Isaiah. This view is confirmed by the fact that in the following year, 1538, there was "Imprynted at Antwerpe by Matthew Crom" a New Testament in which the text of Coverdale was used with the prologues of Tyndale,—a concordance, some annotations, and nearly 200 woodcuts being added by the enterprising printer. In whatever way the Matthew Bible originated, the edition of 1500 copies was purchased by Grafton for the sum of £500, equal to about £6000 of modern money; and, having obtained leave to place on the title-page "Set forth with the King's most gracyous licence," he and his partner published it in the summer of 1537.

---

[1] The above conclusion is not at all contradicted by Coverdale's statement in his address to the reader, that "To help me therein I have had sundry translations, not only in Latin, but also of the Dutch"—or German—"interpreters, whom, because of their singular gifts and special diligence in the Bible, I have been the more glad to follow for the most part, according as I was required." He thinks it quite unnecessary to say that he translated directly from the Hebrew and Greek, but adds, that he was far from rejecting all help and guidance as to the meaning of Hebrew and Greek words, gladly and humbly looking to see how others had interpreted the words into Latin and German.

Taverner's Bible. 1539.

Grafton was afraid that rivals would step in and deprive him of the profits which he expected. He therefore entreated Secretary Cromwell that the sale of his Bible might be expedited by compelling every abbey to take six copies. He also complained that there were "Dutchmen dwelling within the realm, who can neither speak good English, nor write none, who yet will both print and correct such an edition, and who are so covetous that they will not bestow twenty or forty pounds on a learned man as editor." Perhaps the rival edition which he really feared may have been one which was published in 1539 by "John Byddell for Thomas Barthlet," with Richard Taverner, "a learned man, as editor." This was, in fact, what would now be called a "piracy," being Grafton's "Matthew Bible" revised by Taverner, a learned member of the Inner Temple, who had been one of Wolsey's students at Christ Church, and although a layman, had occasionally preached from the university pulpit. Taverner made many alterations in the Matthew Bible, and the rapidity with which he edited the work indicates that he must have used a Bible already annotated by himself as the basis of his labors.[1] Taverner's Bible was printed in folio with "Cum privilegio ad imprimendum solum" on the title-page, and it was at the same time printed in quarto. In the same year folio and quarto editions of the New Testament alone were published, and in the following year, 1540, the New Testament in duodecimo. The Old Testament was reprinted as part of a Bible of 1551, but no other editions are known than those named.

It will have been observed that the translations of Holy Scripture which had been printed during these fourteen years (1526–1539) were all made by private men and printed without any public authority. Some of them had indeed been set forth by the king's license, but the object of this is shown by a letter of Archbishop Cranmer to Secretary Cromwell, requesting that it might be given to Matthew's Bible. It is "that the same may be sold and read of every person, without danger of any act, proclamation, or ordinance heretofore granted to the contrary, until such time that we, the bishops, shall set forth a better translation, Which I think will not be till a day after doomsday." This letter was written on August 4, 1537, and the impatient words at the end refer to an authorized version which had been projected several years before, and which was, in fact, at that very time in preparation, though not proceeding quickly enough to satisfy Cranmer.

Preparation of an authorized version.

In the year 1530 Henry VIII. issued a commission of inquiry respecting the expediency and necessity of having "in the English tongue both the New Testament and the Old," the commission consisting of Sir Thomas More, the two archbishops, and the bishop of London, together with seventeen other "Discreet and well-learned personages" taken from the two universities and "other parts of his realm," whose names are recorded, together "with many more learned men of the said universities in great number assembled then and there together" (Wilkin's *Conc.*, iii. 737). This commission, which included Hugh and William Latimer among its members, reported against the expediency of setting forth a vernacular translation until there was a more settled state of religious opinion, but states that the king "intended to provide that the Holy Scriptures shall be, by great, learned, and Catholic persons, translated into the English tongue if it shall then seem to His Grace convenient to be" (*ibid.* 740). The convocation of Canterbury refreshed the royal memory on the subject by petitioning the king on December 19, 1534, "that His Majesty would vouchsafe to decree, that the Scriptures should be translated into the vulgar tongue by some honest and learned men, to be nominated by the king, and to be delivered to the people according to their learning" (*ibid.* 770). It was doubtless in response to this petition that the measures were taken of which a very slight historical record remains in some notes of Ralph Morrice, Cranmer's secretary. "First," he says, the archbishop "began with the translation of the New Testament, taking an old English translation thereof," —the Wickliffite probably, for Tyndale's was only eight years old,—"which he divided into nine or ten parts, causing each part to be written at large in a paper book, and then to be sent to the best learned bishops and others, to the intent that they should make a perfect correction thereof. And when they had done, he required them to send back their parts so corrected unto him at Lambeth, by a day limited for that purpose; and the same course, no question, he took with the Old Testament." (Camd. Soc. *Narr. of Ref.*, p. 277.) A letter from Bishop Gardiner to Cromwell is preserved among the state papers, dated June 10, 1535, in which the former writes that he had translated St. Luke and St. John for his portion of the work, and that he had expended great labor upon them; and of the rest, with the exception of Stokesley, bishop of London, "when the day came," says Morrice, "every man sent to Lambeth their parts corrected." Some further steps of revision and preparation for the press would no doubt be taken, and the subject was again before convocation in 1536 (Burnet's *Ref.*, i. 314; Pococke's ed. 1865); but as in the case of later revisions of the Bible, the detailed history is lost to us,—all that is known further relating to the printing.

The authorized version of 1539.

For reasons not now known, it was determined that this authorized version should be printed by Francis Regnault, the Paris printer, who provided most of the service-books that were used in England. At the request of Henry VIII., "noster carissimus frater," a license was granted to Regnault for this purpose by Francis the French king, while Coverdale and Grafton were sent over in 1537, the one as a learned editor, the other as a practical printer, to superintend the work as it passed through the press. Portions of the printed sheets were sent home by Bonner, who was then ambassador at the court of Paris, as ambassador's baggage, and were thus conveyed out of France free from any difficulties with the French authorities; but when the printing was far advanced, on December 17, 1538, its further progress was interdicted by the inquisitor-general, and orders were given to seize the whole of the impression. Coverdale and Grafton left Paris quickly, leaving a great number of finished sheets, which were condemned to be burned in the Place Maubert; but, through the connivance of the officer appointed to see this done, the whole of them were sold to a haberdasher as waste paper, and "four great dry vats" full of them sent over to England. As the license to print them had been given at the special request of Henry VIII., it is probable that the escape of the men and the books was facilitated by the civil authorities to prevent any unpleasantness with the English king. A short time afterwards the types, printing-press, and workmen followed the printed sheets, and the volume which had been begun in Paris in 1537, was completed in London, the colophon stating that it was "Fynisshed in Aprыll, Anno M. CCCCC. XXX$^{\text{I}}$X." It is a splendid folio "Bible of the largest volume," and was distinguished from its predecessors by the name of "The Great Bible." The title-page describes it as "The Byble in Englyshe, that is to saye, the content of all the Holy Scripture, bothe of the Olde and Newe Testament, truly translated after the veryte of the Hebreue and Greke texts by ye dylygent studye of dyverse excellent learned men, expert in the forsayde tongues. Prynted by Rychard Grafton and Edward Whitchurch. Cum privilegio ad imprimendum solum, 1539." This was the first of seven editions of this noble Bible which issued from the press during the years 1539–41,—the second of them, that of 1540, having the important addition "This is the Byble apoynted to the vse of the churches" on the title-page. Seventy years afterwards it assumed the form ever since known as the "Authorized Version," but its Psalter is still embedded, without any alteration, in the Book of Common Prayer.

---

[1] Such Bibles of early date are not uncommon; one is now before the writer which is full of Hebrew, Greek, and Latin notes.

The Geneva Bible, 1560.

The "Great Bible" was, however, a dignitary among books, its size and its price (about £6 of modern money) making it comparatively inaccessible as a home volume for private use. The demand for the vernacular Scriptures which the supply of them had caused was at the same time so enormous that before the end of Edward VI.'s reign, 26 editions of folio and quarto Bibles, and about double that number of editions of New Testaments, had been printed. This demand for household Bibles was effectually and unexpectedly met by one on the production of which the English refugees were engaged at Geneva during the last year of Queen Mary's reign and the beginning of the reign of Queen Elizabeth, and which became the household Bible of the English middle classes for at least two generations. The Geneva Bible was not an original translation, but a revision of the Great Bible by Hebrew and Greek scholars, who were quite competent to compare the English translation with the original. It was begun in 1558, when Coverdale was at Geneva, and his ample experience was no doubt enlisted in the work; but after his return to England in the middle of 1559, the responsible editors were William Whittingham, afterwards lay dean of Durham, Anthony Gilby, afterwards for a short time dean of Christ Church and then prebendary of St. Paul's, and Thomas Sampson, afterwards dean of Christ Church. The revision was carried on with such industry that the printing of the Bible was finished in April, 1560. It became popular immediately on account of its handy size, usually that of a small quarto, and of its being printed in a readable Roman type instead of black letter. It also contained a marginal commentary, which proved a great attraction to the Puritans; and, above all, an improvement which Whittingham had already introduced into an independent English New Testament which he had published in 1557 was also introduced into the Bible of 1560, that of dividing the chapters into verses. Like all Bibles hitherto printed, and nearly all that were printed until the latter part of the 17th century, the Geneva Bible contained the Apocrypha, but copies are occasionally found from which it was omitted by the binder.[1] The popularity of this Bible was so great that about 200 editions of it in various sizes from folio downward were published, often with the Prayer Book and metrical Psalms appended; and it gave way very slowly even before the present Authorized Version, which is much superior to it. The first Bible printed in Scotland was a folio reprint of the Geneva version, "Printed in Edinburgh By Alexander Arbuthnot, Printer to the Kinge's Maiestie, dwelling at ye Kirk of feild, 1579."

The Bishops' Bible, 1568.

Soon after the accession of Queen Elizabeth, when the demand for Bibles was again pressing upon the printers, Archbishop Parker organized a revision of the Great Bible of 1539 by "able bishops and other learned men." The work was undertaken by the archbishop himself, eleven other bishops, and four deans and prebendaries, in 1563, the plan of distributing it being precisely the same as that adopted by Archbishop Cranmer. The rules upon which they proceeded were these:—

> "1. To follow the common English translation used in the churches, and not to recede from it, but where it varieth manifestly from the Hebrew or Greek original. 2. To use sections and divisions in the text as Pagnine in his translation useth, and for the verity of the Hebrew to follow the said Pagnine and Munster specially, and generally others learned in the tongues. 3. To make no bitter notes upon any text, or yet to set down any determination in places of controversy. 4. To note such chapters and places as contain matters of genealogies, or other such places not edifying, with some strike or note, that the reader may eschew them in his public reading. 5. That all such words that sound in the old translation to any offence of lightness or obscenity be expressed with more convenient terms and phrases."

Much labor was expended upon this revision, but the printing was completed, and the volume, a large folio, was ready for publication on October 5, 1568. Several editions of it were afterwards published, but it may be doubted whether it was ever cordially received. The Great Bible of 1539 was used in many churches, and the Geneva Bible was in almost every house; and although the 80th Canon of 1603 enjoins that the Bishops' Bible shall be the only one used in churches, it was never reprinted after 1606. A quarto edition was brought out in 1569, and the New Testament was several times printed separately.

The present authorized version, 1611.

The English Bible which is now recognized as the "Authorized Version," wherever the English language is spoken, is a revision of the Bishops' Bible, begun in 1604 and published in 1611. It arose out of the conference between the High Church and Low Church parties which was held by James I. at Hampton Court in 1604, being originally proposed by Dr. Reynolds, president of Corpus Christi College, Oxford, the leader and spokesman of the Low Church party, and subsequently on the committee which revised the translation of the Prophets. No real opposition was offered to the proposal, and the king cleverly sketched out on the moment a plan to be adopted. He "wished that some special pains should be taken in that behalf for one uniform translation, and this to be done by the best learned in both universities; after them to be revised by the bishops and the chief learned of the church; from them to be presented to the Privy Council; and lastly, to be ratified by his royal authority. And so this whole church to be bound upon it, and none other." He also particularly desired that no notes should be added by way of comment in the margin. The appointment of the revisers was a work of much responsibility and labor, and five months elapsed before they were selected and their respective portions assigned to them; but the list of those who began the work, and who, with some few changes in consequence of deaths, brought it to a happy conclusion, shows how large an amount of scholarship was enlisted. It includes Bishop Andrewes, who was familiar with Hebrew, Chaldee, Syriac, Greek, Latin, and ten other languages; Bishop Overall; Dr. Saravia Bedwell, the greatest Arabic scholar of Europe; Sir Henry Savile, the most learned layman of his time; and, to say nothing of others well known to later generations, nine who were then or afterwards professors of Hebrew or of Greek at Oxford or Cambridge. It is observable also that they were chosen without reference to party, at least as many of the Puritan clergy as of the opposite party being placed on the committees, and among them Reynolds and Chaderton, two of the four who had represented those clergy in the Hampton Court conference. The list on p. 340, taken from the General Introduction to Blunt's Annotated Bible, is drawn up in such a way as to show the academical or other position which each of them occupied, and the particular part of the work on which they were engaged; but other scholars also were invited to take the subject up in their private studies, and to communicate with Andrewes at Westminster, or with the professors of Hebrew at Oxford and Cambridge.

When this large body of scholars were set down to their work, a set of rules was drawn up for their guidance, which has happily come down to modern times among the very few records that remain of this great undertaking. By whom they were framed is not known, but it is probable that they were well sifted, and passed through several hands before they reached the exact shape in which they were eventually acted upon.

Rules for the revisers or translators.

> "1. The ordinary Bible read in the church, commonly called the Bishops' Bible, to be followed, and as little altered as the truth of the original will permit. 2. The names of the prophets and the holy writers, with the other names of the text, to be retained, as nigh as may be, accordingly as they were vulgarly used. 3. The old ecclesiastical words to be kept, *videlicet*, the word *church* not to be translated *congregation*, etc. 4. When a word hath divers significations, that to be kept which hath been most commonly used by the most of the ancient fathers, being agreeable to the propriety of the place and the analogy of the faith. 5. The division of the chapters to be altered either not at all, or as little as may be, if necessity so require. 6. No marginal notes at all to be affixed, but only for the explanation of the Hebrew or Greek words which cannot, without some circumlocution, so briefly and fitly be expressed in the text. 7. Such quotations of places to be marginally set down, as shall serve for the fit references of one scripture to another. 8. Every par-

[1] The Geneva Bible has often been called the "Breeches" Bible from the translation of Gen. ii. 7, "They sewed fig leaves together and made themselves breeches." But this had been familiar long before, in Caxton's *Golden Legend* and in the Wickliffite Bible. An edition of Matthew's Bible, printed in 1551, is similarly called the "Bug" Bible, from the reading in Ps. xci. 5, "So that thou shalt not nede to be afrayed for any bugges by night;" but Coverdale's and Taverner's Bibles use the same word equivalent to the modern "bogie." A Bible of 1631 has been called the "Wicked Bible," because the important little word "not" is left out of the Seventh Commandment, an accident which also happened in a German Bible of the last century; and another almost as wicked a volume is a small pearl Bible of 1653, in which St. Paul is made to ask "Know ye not that the unrighteous shall inherit the kingdom of God?"

ticular man of each company to take the same chapter or chapters; and having translated or amended them severally by himself, where he thinketh good, all to meet together, confer what they have done, and agree for their parts what shall stand. 9. As any one company hath despatched any one book in this manner, they shall send it to the rest, to be considered of seriously and judiciously; for his majesty is very careful in this point. 10. If any company, upon the review of the book so sent, doubt or differ upon any place, to send them word thereof, note the place, and withal send the reasons; to which if they consent not, the difference to be compounded at the general meeting, which is to be of the chief persons of each company, at the end of the work. 11. When any place of special obscurity is doubted of, letters to be directed by authority, to send to any learned man in the land for his judgment of such a place. 12. Letters to be sent from every bishop to the rest of his clergy, admonishing them of this translation in hand, and to move and charge as many as, being skilful in the tongues, and having taken pains in that kind, to send his particular observations to the company, either at Westminster, Cambridge, or Oxford, according as it was directed before in the king's letter to the archbishop. 13. The directors in each company to be the deans of Westminster and Chester for that place, and the king's professors in Hebrew and Greek in either university. 14. These translations to be used, when they agree better with the text than the Bishops' Bible, viz., Tyndal's, Mathew's, Coverdale's, Whitchurch's, Geneva. 15. Besides the said directors before mentioned, three or four of the most ancient and grave divines in either of our universities, not employed in translating, to be assigned by the vice-chancellor, upon conference with the rest of the heads, to be overseers of the translations, as well Hebrew as Greek, for the better observation of the fourth rule above specified."

That the work was carried on in the spirit of these rules is shown by the quaint but instructive document which was appended to the Bible as a preface on its completion. It "hath cost the workmen, as light as it seemeth, twice seven times seventy-two days and more: matters of such weight and consequence are to be speeded with maturity: for in a business of moment a man feareth not the blame of convenient slackness. Neither did we think much to consult the translators or commentators, Chaldee, Hebrew, Syrian, Greek, or Latin, no nor the Spanish, French, Italian, or Dutch. Neither did we disdain to revise that which we had done, and to bring back to the anvil that which we had hammered; but having and using such great helps as were needful, and fearing no reproach for slowness, nor coveting praise for expedition, we have at length, through the good hand of the Lord upon us, brought the work to that pass you see." That work occupied the six committees for four or five years, some parts being brought back to the anvil to be hammered as much as fourteen and some as much as seventeen times. But at length it passed into the hands of the printers, and came from the press of Robert Barker, the king's patentee, in two contemporary issues of folio volumes, separately composed and printed for the sake of speedy production, in the year 1611. Since that time many millions of this translation or revised translation have been printed, and the general acceptance of it by all English-speaking people of whatever denomination is a testimony to its excellency.

One principal reason why the English Bible in this last form gives such general satisfaction to the English ear is that it speaks in a language of its own which is conventionally received as a Biblical tongue—a language which is thoroughly English, and which is yet separated by its archaic form from the colloquial English of every-day use on the one hand, and from the literary English of most other books on the other. This archaic language is not, however, that of Elizabethan and Jacobean times, as is sometimes alleged. Its genealogy is to be traced up in a direct line through every state of Biblical revision to the Latin Vulgate, and the common English ancestor of every such revision is the Wickliffite Bible of the 14th century. This may be seen clearly by placing a passage from the Wickliffite New Testament, in modern spelling but in no other way modernized, beside the same passage taken from the Bible in common use:

LUKE XVI. 19–31.

Fourteenth-Century Version in Modern Spelling.	*Authorized Version now in use.*
There was a rich man, and was	There was a certain rich man, which was
clothed in purple and white silk,	clothed in purple and fine linen,
and ate every day shiningly:	and fared sumptuously every day:
and there was a beggar,	and there was a certain beggar
Lazarus by name, that lay	named Lazarus, which was laid
at his gate, full of boils, and	at his gate, full of sores, and
coveted to be fulfilled of	desiring to be fed with
the crumbs that fallen down	the crumbs which fell
from the rich man's board:	from the rich man's table:
and no man gave to him;	
but hounds came and licked	moreover the dogs came and licked
his boils. And it was	his sores. And it came to
done that the beggar died,	pass that the beggar died,
and was borne of angels into	and was carried by the angels into
Abraham's bosom: And the	Abraham's bosom: the
rich man was dead also and	rich man also died and
was buried in hell. And	was buried; and in hell
he raised his eyes when he	he lifted up his eyes, being
was in torments, and saw	in torments, and seeth
Abraham afar, and Lazarus	Abraham afar off, and Lazarus
in his bosom. And he cried	in his bosom. And he cried
and said, Father Abraham,	and said, Father Abraham,
have mercy on me, and send	have mercy on me, and send
Lazarus, that he dip the	Lazarus, that he may dip the
end of his finger in water,	tip of his finger in water,
to cool my tongue; for I	and cool my tongue; for I
am tormented in this flame.	am tormented in this flame.
And Abraham said to him,	But Abraham said,
Son, have mind, for thou	Son, remember that thou
hast received good thing	in thy lifetime receivedst thy
in thy life, and Lazarus also	good things, and likewise Lazarus
evil things: but he is now	evil things: but now he is
comforted, and thou art tor-	comforted, and thou art tor-
mented. And in all	mented. And beside all
these things, a great dark	this, between us and you
place is established	there is a great gulf fixed:
betwixt us and you; that they	so that they which would pass
that would from hence pass	from hence to you cannot;
to you may not; neither	neither can they pass to us
from thence pass over hither.	which would come from thence.
And he said, Then I pray	Then he said, I pray thee
thee, Father, that thou	therefore, Father, that thou
send him into the house	wouldest send him to my
of my father: for I have five	father's house: for I have five
brethren; that he witness to	brethren; that he may testify unto
them, lest also they come	them, lest they also come
into this place of torments.	into this place of torment.
And Abraham said to him,	Abraham saith unto him,
They have Moses and the prophets;	They have Moses and the prophets;
hear they them. And he said,	let them hear them. And he said,
Nay, Father Abraham, but	Nay, Father Abraham, but
if any of dead men go to	if one went unto them from the dead,
them, they shall do penance.	they will repent.
And he said to him, If they	And he said unto him, If they
hear not Moses and the prophets,	hear not Moses and the prophets,
neither if any of dead men	neither will they be persuaded,
rise again, they should believe	though one rose from the
to him.	dead.

That this remarkable continuity of expression has great practical value is shown by the fact that the only other English Bible which has ever lived beyond one edition, that of the Roman Catholics, has been imperceptibly approximating to the Authorized Version at every revision that it has undergone since the original publication of the New Testament at Rheims in 1582, and the Old Testament at Douay in 1610. Nor, it is satisfactory to add, has the tender hand with which the Old English of the Bible has been touched in the course of revision led to any sacrifice of sound translation. Modern scholarship may be able to introduce some improvements making the version of still greater value, but upon the whole it already stands pre-eminent for its accurate representation of the original Hebrew and Greek, and may challenge favorable comparison in this respect with the Septuagint, with the Latin Vulgate, or with any other version.

Recent revision.

The question of revision of the Authorized Version has been frequently discussed, but it is only in very recent times that anything has been done which appears to call for particular mention here. In February, 1870, the convocation of Canterbury, at the instigation of the bishop of Winchester, Dr. Samuel Wilberforce, appointed a committee to consider the subject, which three months afterwards reported in the following terms:—

> "1. That it is desirable that a revision of the Authorized Version of the Holy Scripture be undertaken. 2. That the revision be so conducted as to comprise both marginal renderings, and such emendations as it may be found necessary to insert in the text of the Authorized Version. 3. That in the above resolutions, we do not contemplate any new translation of the Bible, or any alteration of the language, except where, in the judgment of the most competent scholars, such change is necessary. 4. That in such necessary changes the style of the language employed in the existing version be closely followed. 5. That it is desirable that convocation should nominate a body of its own members to undertake the work of revision, who shall be at liberty to invite the co-operation of any eminent for scholarship, to whatever nation or religious body they may belong."

The report was adopted, and two companies were formed for the revision of the Authorized Version of the Old and New Testaments respectively, consisting of members of convocation and other distinguished Biblical scholars. During the eight years that have elapsed since their appointment the two companies have devoted themselves assiduously to the discharge of the task assigned them, and it is understood that their work is now (1878) approaching completion, but no part of the new revision has yet been published.

Bibliography.

There is still much to be learned respecting the bibliographical history of the English Bible, but several useful works have appeared among the many that have been written on the subject. The earliest attempt was *An Historical Account of the several English Translations of the Bible, etc.*, by Anthony Johnson, 1730. This was followed in 1731 by Lewis's *Complete History of the several Translations of the Holy Bible and New Testament into English,* which was until recently, the standard work on the subject. Archbishop Newcome wrote *An Historical View of the English Biblical Translations, etc.*, with a list of the various editions from 1526 to 1776, which was published at Dublin in 1792. In 1821 Archdeacon Cotton brought out *A List of Editions of the Bible and parts thereof in English, from the year 1505 to 1820*, which has been republished in a corrected and enlarged form, and is a work of much value. The *Annals of the English Bible,* by Christopher Anderson, printed in two volumes in 1845, was a well-meant attempt to give a complete view of the subject, but is exceedingly diffuse, and is deficient in critical value. Far the most valuable account extant of the Manuscript English Bible is that which forms the preface to Forshall and Madden's edition of the Wickliffite Bible, published at the Clarendon Press in 1850. Taking equally authoritative positions as regards the printed English Bible are Westcott's *General View of the History of the English Bible,* 1868, and the exhaustive account given of the Authorized Version of 1611 in the introduction to Scrivener's *Cambridge Paragraph Bible,* 1873. More recently has appeared, in two volumes, Eadie's *The English Bible: an External and Critical History of the various English Translations of the Scripture,* 1876, which is the fullest popular account extant of the whole subject. The most complete list of printed English Bibles is, however, that contained in *The Bibles in the Caxton Exhibition*, by Henry Stevens, 1878, where much valuable bibliographical information on the subject is to be found. (J. H. BL.)

ENGLISH LANGUAGE. In its widest sense, the name is now conveniently used to comprehend the language of the English people from their settlement in Britain to the present day, the various stages through which it has passed being distinguished as Old, Middle, and New or Modern English. In works yet recent, and even in some still current, the name *English* is confined to the third or at most extended to the second and third of these stages, since the language assumed in the main the vocabulary and grammatical forms which it now presents, the oldest or inflected stage being treated as a separate language, under the title of *Anglo-Saxon,* while the transition period which connects the two has been called *Semi-Saxon.* This view had the justification that, looked upon by themselves, either as vehicles of thought or as objects of study and analysis, Old English, or Anglo-Saxon, and Modern English are for all practical ends, distinct languages,—as much so, for example, as Latin and Spanish. No amount of familiarity with Modern English, including its local dialects, would enable the student to read Anglo-Saxon, three-fourths of the vocabulary of which have perished and been reconstructed within 800 years;[1] nor would a knowledge even of these lost words give him the power, since the grammatical system, alike in accidence and syntax, would be entirely strange to him. Indeed, it is probable that a modern Englishman would acquire the power of reading and writing French in less time than it would cost him to attain to the same proficiency in Old English; so that if the test of distinct languages be their degree of practical difference from each other, it cannot be denied that "Anglo-Saxon" is a distant language from Modern English. But when we view the subject historically, recognizing the fact that living speech is subject to continuous change in certain definite directions, determined by the constitution and circumstances of mankind, as an evolution or development of which we can trace the steps, and that, owing to the abundance of written materials, this evolution appears so gradual in English that we can nowhere draw distinct lines separating its successive stages, we recognize these stages as merely temporary phases of an individual whole, and speak of the English language as used alike by Cynewulf and by Tennyson, just as we include alike King Alfred and Mr. Bright as members of the English race.[2] It must not be forgotten, however, that in this wide sense the English language includes, not only the literary or courtly forms of speech used at successive periods, but also the popular and, it may be, altogether unwritten dialects that exist by their side. Only on this basis, indeed, can we speak of Old, Middle, and Modern English as the same *language,* since in actual fact the precise *dialect* which is now the cultivated language, or "English" par excellence, is not the descendant of that dialect which was the cultivated language or English of Alfred, but of a sister dialect then sunk in obscurity,—even as the direct descendant of Alfred's "Englisc" is now to be found in the neglected and non-literary rustic speech of Wiltshire and Somersetshire. Causes which, linguistically considered, are external and accidental, have shifted the political and intellectual centre of England, and along with it transferred literary and courtly patronage from one form of English to another; if the centre of influence had happened to be fixed at York or on the banks of the Forth, both would probably have been neglected for a third.

The English language, thus defined, is not "native" to Britain, that is, it was not found here at the dawn of history, but was introduced by foreign immigrants at a date many centuries later. At the Roman Conquest of the island, the languages spoken by the natives belonged all (so far as is known) to the Celtic branch of the Aryan family, modern forms of which still survive in Wales, Ireland, the Scottish Highlands, Isle of Man, and Brittany, while one has quite recently become extinct in Cornwall. Dialects allied to Welsh and Cornish were apparently spoken over the greater part of Britain, as far north as the Firths of Forth and Clyde; beyond these estuaries and in the isles to the west, including Ireland and Man, dialects akin to Irish and Scottish Gaelic prevailed. The dialect of the Picts in the east of Scotland, according to recent inquiries, presented characteristics uniting the British or Cymric with the Gaelic division.[3] The long occupation of South Britain by the Romans (43–409 A.D.)—a period, it must not be forgotten, equal to that from the close of the Middle Ages to the present day, or to the whole duration of Modern English—familiarized the provincial inhabitants with Latin, which was probably the ordinary speech of the towns. Gildas, writing nearly a century and a half after the renunciation of Honorius, addressed the British princes in that language;[1] and the linguistic history of Britain might have been not different from that of Gaul, Spain, and the other provinces of the Western Empire, where a rustic Latin giving birth to a neo-Latinic language finally superseded the native one except in remote and mountainous districts,[2] when the course of events was entirely changed by the Teutonic conquests of the 5th and 6th centuries.

---

[1] A careful examination of several letters of Bosworth's Anglo-Saxon Dictionary gives in 2000 words (including derivatives and compounds, but excluding orthographic variants) 535 which still exist as Modern English words.

[2] The practical convenience of having one name for what was the same thing in various stages of development is not affected by the probability that (Mr. Freeman notwithstanding) *Engle* and *Englisc* were, at an early period, *not* applied to the whole of our Teutonic ancestors in Britain, but only to a part of them. The dialects of *Engle* and *Seaxan* were alike old forms of what was afterwards English speech, and so, viewed in relation to it, *Old English*, whatever their contemporary names might be.

[3] As to the place of the Pictish, see Dr. W. F. Skene's *Four Ancient Books of Wales*, I. vii., viii. Prof. Rhys says "the Picts, Mr. Skene notwithstanding, were probably Kymric rather than Goidelic."—*Welsh Philology*, p. 19.

The Angles, Saxons, and their allies belonged to the Teutonic or Gothic branch of the Aryan family, represented in modern times not only by the English and their colonies, but by the populations of Germany, Holland, Denmark, and the Scandinavian peninsula, and found at the dawn of history located between and about the estuaries and lower courses of the Rhine and the Weser, and the adjacent coasts and isles. For more than 1000 years the Teutonic or Gothic stock has been divided into the three branches of the Low German, High German, and Scandinavian, of which the former represents the original stock, the two others being offshoots to the south and north respectively. To it also belonged the Mœso-Gothic, the tongue of certain Germans who, passing down the Danube, invaded the borders of the empire, and obtained settlements in the province of Mœsia, where their language was committed to writing in the 4th century; its literary remains are of peculiar value as the oldest specimens, by several centuries, of Teutonic speech. To the Low German division also belonged the dialects of the invaders of Britain. As we have no specimens of the language of these tribes for nearly three centuries after their settlement in this island, we cannot tell to what extent they agreed with, and differed from, each other; nor can we be sure whether the differences actually found at a later period, when we have opportunity of comparison, between northern and southern English, were due to original diversity, or to subsequent differentiation. However, as the dialectal differences afterwards discernible corresponded in the main to the areas historically assigned to Angles and Saxons respectively, it may be assumed that there was some difference of dialect to begin with, that of the Saxons being more closely allied to the Old Saxon of the Continent, of which Dutch is probably the nearest living representative, and the Angle dialect having more affinity with the Frisian, and through that with the Scandinavian. At the present day the most English or Angli-form dialects of the Continent are those of the North Frisian islands of Amrum and Sylt, on the west coast of Schleswig. It is well known that the greater part of the ancient Friesland has been swept away by the encroachments of the North Sea, and the *disjecta membra* of the Frisian race, pressed by the sea in front and encroaching nationalities behind, are found only in isolated fragments from the Zuyder Zee to the coasts of Denmark. Of the Geátas, Eótas, or "Jutes," who, according to Bæda, formed the third tribe along with the Angles and Saxons, it is difficult to speak linguistically. In the opinion of the present writer, the speech of Kent has ever been a typically southern or "Saxon" one, and at the present day its popular dialect is identical with that of Sussex, one of the old Saxon kingdoms; that of the Isle of Wight differs in no respect from that of Hampshire, nor does it show any special connection with that of Kent. Mr. Henry Sweet has, however, shown[3] that Kentish as early as the 8th century differed from West-Saxon in one or two points of vowel pronunciation, and that the distinction was maintained as late as the 14th; though it cannot be said to have therein approached more closely to the northern dialect, which ought to have been the case had Bæda's "Geátas" been Jutlanders.

As it was amongst the *Angel-cynn* or *Engle* of Northumbria that literary culture first flourished, and an Angle or *Englisc* dialect was the first to be used for vernacular literature,[4] *Englisc* came eventually to be a general name for all forms of the vernacular as opposed to Latin, etc.; and even when the West-Saxon of Alfred became in its turn the literary or classical form of speech, it was still called Englisc or *English*. The origin of the name Anglo-Saxon is disputed, some maintaining very positively that it means a union of Angles and Saxons, others (with better foundation) that it meant *English Saxons*, or Saxons of England, as distinguished from Saxons of the Continent. Its modern use is mainly due to the little band of scholars who in the 16th and 17th centuries turned their attention to the long-forgotten language of Alfred and Ælfric, which as it differed so utterly from the English of their own day, they found it convenient to distinguish by a name which was applied to themselves by those who spoke it.[5] To them "Anglo-Saxon" and "English" were separated by a gulf which it was reserved for later scholars to bridge across and show the historical continuity of the English of all ages.

As already hinted, the English language, in the wide sense, presents three main stages of development—Old, Middle, and Modern—distinguished by their inflexional characteristics. The latter can be best summarized in the words of Mr. Henry Sweet, in his *History of English Sounds*:[6] "Old English is the period of *full* inflexions (*name, gifan, caru*), Middle English of *levelled* inflexions (*naame, given, caare*), and Modern English of *lost* inflexions (*name, give, care = nām, giv, cār*). We have besides two periods of *transition*, one in which *nama* and *name* exist side by side, and another in which final *e* [with other endings] is beginning to drop." By *lost* inflexions it is meant that only very few remain, and these mostly non-syllabic, as the *-s* in stones, the *-ed* in lov*ed*, the *-r* in thei*r*, as contrasted with the Old English stán-*as*, luf-*od-e* and luf-*od-on*, þá-ra. Each of these periods may also be divided into two—an early and a late; but from the want of materials this division may be waived in regard to the first. We have thus the following divisions, with the approximate dates, which, however, varied considerably for different dialects and parts of the country:—

Old English or Anglo-Saxon......................		to 1100
Transition Old English, or "Semi-Saxon"....	1100	to 1200
Early Middle English, or "Early English"...	1200	to 1300
Late Middle English................................	1300	to 1400
Transition Middle English.........................	1400	to 1485
Early Modern English, "Tudor English".....	1485	to 1611
Modern English..	1611	onward.

Many writers carry the Transition Old English down to 1250, Early Middle English thence to 1350, and Late Middle English 1350 to 1485, absorbing the Second Transition period. But the division given above, which was, I believe, first proposed by Mr. Sweet, represents better the development of the language.

The OLD ENGLISH, or Anglo-Saxon tongue, as introduced into Britain, was highly inflexional, though its inflexions were not so full as those of the older Mœso-Gothic, and considerably less so than those of Greek and Latin during their classical periods. They corresponded on the whole to those of modern literary German, though both in nouns and verbs the forms were more distinct; for example, the German *guten* answers to *three* Old English forms,—*gódne, gódum, gódan; guter* to *two*—*gódre, gódra; liebten* to *two*,—*lufodon* and *lufeden*. Nouns had four cases, *Nominative, Accusative* (not always distinct), *Genitive, Dative*, the latter used also with prepositions to express locative, instrumental, and most ablative relations; of a distinct instrumental case only vestiges occur. There were several declensions of nouns, the main division being that known in Teutonic languages generally as strong and weak,—a distinction also extending to adjectives in such wise that every adjective assumed either inflexion as determined by associated grammatical forms. The first and second personal pronouns possessed a dual; the third person had a complete declension of the stem *he*, instead of being made up as now of the three seen in *he, she, they*. The verb distinguished the subjunctive from the indicative mood, but had only two inflected tenses, present and past,—the former also used for the future, the latter for all the shades of past time. The order of the sentence corresponded generally to that of German. Thus from King Alfred's additions to his translation of Orosius:—Donne þy ylcan dæge hi hine to þæm ade beran wyllaꝺ, þonne todælaꝺ hi his feoh. þaet þær to lafe biꝺ æfter þæm gedrynce and þæm plegan. on fif oꝺꝺe syx. hwilum on ma. swa swa þaes feos andefn biꝺ. "Then the same day [that] they him to the pile bear will then divide they his property that there to remainder is, after the drinking and the sports, into five or six, at times into more, according as of the property the value is."

---

[1] The works of Gildas in the original Latin were edited by Mr. Stevenson for the English Historical Society. There is an English translation in *Six Old English Chronicles* in Bohn's Antiquarian Library.

[2] As to the continued existence of Latin in Britain, see further in Rhys's *Lectures on Welsh Philology*, p. 226–7.

[3] "Dialects and Prehistoric Forms of English," *Transactions of the Philological Society* for 1875–6, pp. 543.

[4] See also Earle's *Philology of the English Tongue*, p. 25.

[5] Æthelstan in 934 calls himself in a charter "Ongol-Saxna cyning and Brytænwalda eallæs thyses iglandes;" Eadred in 955 is "Angulseaxna cyning and cásere totius Britanniæ," and the name is of frequent occurrence in Latin documents. These facts ought to be remembered in the interest of the scholars of the 17th century, who have been blamed for the use of the term Anglo-Saxon, as if they had invented it. By "Anglo-Saxon" language they meant the language of the people who *sometimes at least* called themselves "Anglo-Saxons." Even now the name is practically useful, when we are dealing with the subject *per se*, as is *Old English*, on the other hand, when we are treating it historically or in connection with English, as a whole.

[6] *Transactions of the Philological Society*, 1873–4, p. 620.

The poetry was distinguished by alliteration, and the abundant use of figurative and metaphorical expressions, of bold compounds and archaic words never found in prose. Thus in the following lines from Beowulf:—

> *St*ræt wæs *st*án-fáh, *st*ig wisode
> *G*umum æt*g*ædere. *g*úꝺ-byrne scán
> *H*eard *h*ond-locen. *h*ring-iren scir
> *S*ong in *s*earwum, þæt hie to *s*ele furꝺum
> *I*n hyra *gry*′re *g*eatwum, *g*angan cwomon.[1]
>
> The street was stone-variegated, (it) pointed the path
> To (the) men together; the war-mailcoat shone,
> "Hard hand-locked. The ring-iron sheer (bright ring-mail)
> Sang in their cunning-trappings, as they to hall forth
> In their horror-accoutrements to go came."

The Old English was a homogeneous language, having very few foreign elements in it, and forming its compounds and derivatives entirely from its own resources. A few Latin appellatives learned from the Romans in the German wars had been adopted into the common Teutonic tongue, and are found in English as in the allied dialects. Such were *strœte*, street (*via strata*), *camp*, battle, *cásere*, Cæsar, *míl*, mile, *pín*, punishment; perhaps *cyrice*, church, *biscop*, bishop, *læden*, Latin language, *cése*, cheese, *butor*, butter, *pipor*, pepper, *olfend*, camel (*elephantus*), *pund*, pound, *ynce*, inch (*uncia*), and a few others. The relations of the first invaders to the Britons were to a great extent those of destroyers; and with the exception of the proper names of places and prominent natural features, which as is usual were retained by the new population, few British words found their way into the Old English. Among these are named *broc*, a badger, *bréc*, breeches, *clút*, clout, *púl*, pool, and a few words relating to the employment of field or household menials. Still fewer words seem to have been adopted from the provincial Latin, almost the only certain one being *castra*, applied to the Roman towns, which appeared in English as *cœstre*, *ceaster*, now found in composition as *-caster*, *-chester*, *-cester*. The introduction and gradual adoption of Christianity brought a new series of Latin words connected with the offices of the church, the accompaniments of higher civilization, the foreign productions either actually made known, or mentioned in the Scriptures and devotional books. Such were *mynster* (monasterium), *ælmesse* (eleemosyna), *candel* (candela), *turtle* (turtur), *fic* (ficus), *cedar* (cedrus). These words, whose number increased from the 7th to the 10th century, are commonly called *Latin of the second period*, the Latin of the first period including the Latin words brought by the English from Germany, as well as those picked up in Britain either from the provincials or the Welsh, which have not hitherto been separated from them. The Danish invasions of the 8th and 10th centuries resulted in the establishment of extensive Danish and Norwegian populations, about the basin of the Humber and its tributaries, and above Morecambe Bay. Although these Scandinavian settlers must have greatly affected the language of their own localities, few traces of their influence are to be found in the literature of the Old English period. As with the greater part of the words adopted from the Celtic, it was not until after the dominion of the Norman had overlaid all preceding conquests, and the new English began to emerge from the ruins of the old, that Danish words in any number made their appearance in books, as equally native with the Anglo-Saxon.

The earliest specimens we have of English date to the end of the 7th century, and belong to the Anglian or northern dialect, which under the political eminence of the early Northumbrian kings from Edwin to Ecgfriꝺ, aided perhaps by the learning of the scholars of Iona, first attained to literary distinction. Of this literature in its original form mere fragments exist, one of the most interesting of which consists of the verses uttered by Bæda on his deathbed, and preserved in a nearly contemporary MS.:—

> Fore ther*e* neid-faerae . naenig uuiurthit
> thonc-snotturra . than him tharf sie,
> to ymb-hycggannæ . aer his hin-iongae,
> huaet his gastae . godaes aeththa yflaes,
> aefter deoth-daege . doemid uueorthae.
>
> Before the inevitable journey no one becomes
> More thought-prudent than he has need,
> To ponder, ere his hence-going,
> What, to his ghost, of good or of ill,
> After death-day, deemed shall be.

But our chief acquaintance with Old English is in its West-Saxon form, the earliest literary remains of which date to the 9th century, when under the political supremacy of Wessex and the scholarship of King Alfred it became the literary language of the English nation, the classical "Anglo-Saxon." If our materials were more extensive, it would probably be necessary to divide the Old English into several periods; as it is, Mr. Sweet, who has labored chiefly in this field, has pointed out considerable differences between the "early West-Saxon" of King Alfred and the later language of the 11th century,[2] the earlier language having numerous inflexional and phonetic distinctions which are "levelled" in the later, showing that the tendency to pass from the synthetical to the analytical stage existed quite independently of the Norman Conquest. The northern dialect, whose literary career had been cut short in the 8th century by the Danish invasions, reappears in the 10th in the form of glosses to the Latin gospels and the Ritual of Durham, where we find that in the process of inflexion-levelling it has, owing to the confusion which had so long reigned in the north, advanced far beyond the sister dialect of the south, so as to be already almost Transition English, or "Semi-Saxon."

Among the literary remains of the Old English may be mentioned the epic poem of Beowulf, the original nucleus of which has been supposed to date to heathen and even Continental times, though we now possess it only in a later form; several works of Alfred, two of which, his translation of Orosius, and of *The Pastoral Care* of St. Gregory, are contemporary specimens of his language; the theological works of Ælfric (including translations of the Pentateuch and the gospels) and of Wulfstán; the poetical works of Cynewulf; those ascribed to Cædmon; the Anglo-Saxon Chronicle; and many works both in prose and verse of which the authors are unknown.

The earliest specimens, the inscriptions on the Ruthwell and Bewcastle crosses, are in a Runic character; but the letters used in the manuscripts generally are a British variety of the Roman alphabet which the Anglo-Saxons found in the island, and which was also used by the Welsh and Irish.[3] Several of the letters had in Britain developed forms, and retained or acquired values, unlike those used on the Continent, in particular ꝺ ꝼ ᵹ ꞃ ꞅ ꞇ (d f g r s t). The letters k q z were not used, q being represented by cw; u or v was only a vowel, the consonantal power of v being represented as in Welsh by f. The Runes called *thorn* and *wén*, for which the Roman alphabet had no character, were at first expressed by th, ꝺ (a contraction for ꝺꝺ or ꝺh) and v or u; but at a later period the characters þ and þ were revived from the old Runic alphabet. Contrary to Continental usage, the letters c and ᵹ (g) had only their hard or guttural powers, as in the neighboring Celtic languages; so that words which, when the Continental Roman alphabet came to be used for Germanic languages, had to be written with *k* were in Old English written with *c*, as *cirice* = *kirke*. The key to the values of the letters, and thus to the pronunciation of Old English, is also to be found in the Celtic tongues whence the letters were taken.

The Old English period is usually considered as terminating about the year 1100,—that is, with the death of the generation who saw the Norman Conquest. The Conquest established in England a foreign court, a foreign aristocracy, and a foreign hierarchy.[4] The French language, in its Norman dialect, became the only polite medium of intercourse. The native tongue, despised not only as unknown, but as the language of a subject race, was left to the use of boors and serfs, and except in a few stray cases ceased to be written at all.[1] The natural results followed. When the educated generation that saw the arrival of the Norman died out, the language, ceasing to be read and written, lost all its literary words. The words of ordinary life whose preservation is independent of books lived on as vigorously as ever, but the literary terms, those that related to science, art, and higher culture, the bold artistic compounds, the figurative terms of poetry, were speedily forgotten. The practical vocabulary shrank to a fraction of its former extent. And when, generations later, English began to be used for general literature, the only terms at hand to express ideas above those of every-day life were to be found in the French of the privileged classes, of whom alone art, science, law, and theology had been for generations the inheritance. Hence each successive literary effort of the reviving English tongue shows a larger adoption of French words to supply the place of the forgotten native ones, till by the days of Chaucer they constituted a formidable part of the vocabulary. Nor was it for the time being only that the French words affected the English vocabulary. The Norman French words introduced by the Conquest, as well as the Parisian French words which followed under the early Plantagenets, were, the bulk of them, Latin words which had lived on among the people of Gaul, and, modified in the mouths of succeeding generations, had reached forms more or less remote from their originals. In being now adopted as English, they supplied precedents in accordance with which other Latin words without limit might be converted into English ones, whenever required; and long before the Renaissance of classical learning, though in much greater numbers after that epoch, these precedents were eagerly followed.

[4] For a discriminating view of the effects of the Norman Conquest on the English Language, see Freeman, *Norman Conquest*, ch. xxv.

While the eventual though distant result of the Norman Conquest was thus a large reconstruction of the English vocabulary, the grammar of the language was not directly affected by it. There was no reason why it should,—we might almost add, no way by which it could. While the English used their own *words*, they could not forget their own *way* of using them, the inflexions and constructions by which alone the words expressed ideas,—in other words, their grammar: when one by one French words were introduced into the sentence they became English by the very act of admission, and were at once subjected to all the duties and liabilities of English words in the same position. This is of course precisely what we do at the present day: *telegraph* and *telegram* make participle *telegraphing* and plural *telegrams*, and "*scrumptious*," adverb "*scrumptiously*," precisely as if they had been in the language for ages.

But indirectly the grammar was affected very quickly. In languages in the inflected or synthetic stage the terminations must be pronounced with marked distinctness, as these contain the correlation of ideas; it is all-important to hear whether a word is *bonus* or *bonis* or *bonas* or *bonos*. This implies a measured and careful pronunciation, against which the effort for ease and rapidity of utterance is continually struggling, while indolence and carelessness continually compromise it. There has been an increasing tendency in English, as in other languages, to give each word one main accent, at or near the beginning, and to suffer the concluding syllables to fall into obscurity. We are familiar with the cockney *winder*, *sofer*, *holler*, *Sarer*, *Sunder*, for window, sof*a*, holl*a*, Sara*h*, Sund*ay*, the various final vowels sinking into an obscure neutral one conventionally spelt *er*. Already before the Conquest, forms originally *hatu*, *sello*, *tunga*, appeared as *hate*, *selle*, *tunge*, with the terminations levelled to obscure *e*, but during the illiterate period of the language after the Conquest, this careless obscuring of terminal vowels became universal, all unaccented vowels in the final syllable (except *i*) sinking into *e*. During the 12th century, while this change was going on, we find a great confusion of grammatical forms, the full inflexions of Old English standing side by side in the same sentence with the levelled ones of Middle English. It is to this state of the language that the names *Transition* and *Period of Confusion* (Dr. Abbott's appellation) point; its appearance, as that of Anglo-Saxon broken down in its endings, had previously given to it the suggestive if not strictly logical title of Semi-Saxon. By most writers the close of the period has been brought down to 1250; but very shortly after 1200 in the south, and considerably before it in the north, the levelling of inflexions was complete, and the language possessed of a tolerably settled system of new grammatical forms, the use of which marks Middle English.

Although the written remains of the TRANSITION OLD ENGLISH are few, sufficient exist to enable us to trace the course of linguistic change. Within two generations after the Conquest, faithful pens were at work transliterating the old homilies of Ælfric, and other lights of the Anglo-Saxon Church into the neglected idiom of their posterity. Twice during the period, in the reigns of Stephen and Henry II., Ælfric's gospels were similarly modernized so as to be "understanded of the people." And shortly after 1100 appeared the great work of the age, the versified *Chronicle* of Layamon, or Lawëman, a priest of Ernely, on the Severn, who, using as his basis the French *Brut* of Wace, expanded it by additions of his own to more than twice the extent; his work of 32,250 lines is a mine of illustration for the language of the period. While these southern remains carry on in unbroken sequence the history of the Old English of Alfred and Ælfric, the history of the northern English is an entire blank from the 11th to the 13th century. The stubborn resistance of the north, and the terrible retaliation inflicted by William, apparently effaced northern English culture for centuries. If anything was written in the vernacular in the kingdom of Scotland during the same period, it probably perished during the calamities to which that country was subjected during the half century of struggle for independence. In reality, however, the northern English had entered its Transition or "Semi-Saxon" stage two centuries earlier; the glosses of the 10th century show that the Danish inroads had there anticipated the results hastened by the Norman Conquest in the south. Meanwhile a dialect was making its appearance in another quarter of England, destined to overshadow the old literary dialects of north and south alike, and become the English of the future. The Mercian kingdom, which, as its name imports, lay along the *marches* of the earlier states, and was really a congeries of the outlying members of many tribes, must have presented from the beginning a linguistic mixture and transition; and it is probable that more than one intermediate form of speech arose within its confines, between Lancashire and the Thames. But the only specimen of such we can with some degree of certainty produce comes towards the close of the Old English period, in the gloss to the Rushworth Gospels, which, so far as concerns St. Matthew, and a few verses of St. John xviii., is probably in a Mercian dialect. At least it presents a phase of the language which in inflexional decay stands about midway between the West-Saxon and the Northumbrian glosses, to which it is yet posterior in time. But soon after the Conquest we find an undoubted midland dialect in the Transition stage from Old to Middle English, in the south-eastern part of ancient Mercia, in a district bounded on the south and south-east by the Saxon Middlesex and Essex, and on the east and north by the East Anglian Norfolk and Suffolk and the Danish settlements on the Trent and Humber. In this district, and in the monastery of Peterborough, one of the copies of the Old English Chronicle, transcribed about 1120, was written up by two succeeding hands to the death of Stephen in 1154. The section from 1122 to 1131, written in the latter year, shows the same confusion as in Layamon between Old English forms and those of a still simpler Middle English, impatient to rid itself of the inflexional trammels which were still, though in weakened forms, so tightly hugged south of the Thames. And in the concluding section, written in 1154, we find Middle English fairly started on its career. A specimen of this new tongue will best show the change that had taken place.

1140 A. D.—*And* te eorl of Angæu wærd ded, and his sune Henri toc to þe rice. And te cuen of France to-dælde fra þe king, and scæ co*m* to þe iunge eorl Henri. *and* he toc hire to wiue, *and* al Peitou mid hire. þa ferde he mid micel færd into Engeland *and* wan castles—*and* te king ferde agenes hi*m* mid micel mare ferd. þoþwæthere fuhtten hi noht. oc ferden þe ærcebi*scop* *and* te wise men betwux heo*m*, and makede *that* sahte *that* te king sculde ben lauerd

---

[1] There is not the least reason to suppose that any attempt was made to proscribe or suppress the native tongue, which was indeed used in some official documents addressed to Englishmen by the Conqueror himself. Its social degradation seemed even on the point of coming to an end, when it was confirmed and prolonged for two centuries more by the accession of the Angevin dynasty, under whom everything French received a fresh impetus.

and king wile he liuede. *and* æft*er* his dæi ware Henri king. *and* he helde hi*m* for fader, *and* he hi*m* for sune. *and* sib *and* sæhte sculde ben betwyx heo*m*, and on al Engeland.[1]

With this may be contrasted a specimen of southern English, at least 25 years later (Hatton Gospels, Luke i., 46).[2]

Ða cwæð Maria: Min saule mersed drihten, and min gast ge-blissode on gode minen hælende. For þam þe he ge-seah his þinene eadmodnysse. Soðlice henen-forð me eadige seggeð alle cneornesse; for þam þe me mychele þing dyde se þe mihtyg ys; *and* his name is halig. *And* his mildheortnysse of cneornisse on cneornesse hine on-draedende. He worhte maegne on hys earme; he to-daelde þa ofermode, on moda heora heortan. He warp þa rice of setlle, and þa eadmode he up-an-hof. Hyngriende he mid gode ge-felde, *and* þa ofermode ydele for-let. He afeng israel his cniht, and gemynde his mildheortnysse; Swa he spræc to ure fæderen Abrahame, *and* his sæde on a weorlde.

The MIDDLE ENGLISH stage was pre-eminently the *Dialectal* period of the language. It was not till after the middle of the 14th century that English obtained official recognition as a language. For three centuries, therefore, there was no standard form of speech which claimed any pre-eminence over the others. The writers of each district wrote in the dialect familiar to them; and between extreme forms the difference was so great as to amount to unintelligibility; works written for southern Englishmen had to be translated for the benefit of the men of the north:—

> "In sotherin Inglis was it drawin,
> And turnid ic haue it till ur awin
> Langage of þe northin lede
> That can na nothir Inglis rede."
> *Cursor Mundi*, 20,064.

Three main dialects were distinguished by contemporary writers, as in the often-quoted passage from Trevisa's translation of Higden's *Polychronicon* completed in 1387:—"Also Englysche men . . . hadde fram þe bygynnynge þre maner speche, Souþeron, Norþeron, *and* Myddel speche (in þe myddel of þe lond) as hy come of þre maner people of Germania. . . . Also of þe forseyde Saxon tonge, þat ys deled a þre, *and* ys abyde scarslych*e* wiþ feaw uplondysch*e* men *and* ys gret wondur, for men of þe est wiþ men of þe west, as hyt were under þe same part of heyvene, acordeþ more in sounynge of sþeche þan men of þe norþ wiþ men of þe souþ; þerfore hyt ys þat Mercii, þat buþ men of myddel Engelond, as hyt were parteners of þe endes, undurstondeþ betre þe syde longages Norþeron and Souþeron, þan Norþern *and* Souþern undurstondeþ oyþer oþer."

The modern study of these Middle English dialects, initiated by Mr. Garnett, and elaborated by Dr. Richard Morris,[3] has shown that they were readily distinguished by the conjugation of the present tense of the verb, which in typical specimens was as follows:—

	Southern.
Ich singe.	We singeþ.
Þou singest.	ȝe singeþ.
He singeþ.	Hy singeþ.
	Midland.
Ich, I, singe.	We singen.
Þou singest.	ȝe singen.
He singeþ.	Hy, thei, singen.
	Northern.
Ic, I, syng(e).	We syng(e), We þat synges.
Þu synges.	ȝe syng(e), ȝe foules synges.
He synges.	Thay syng(e), Men synges.

Of these the southern is simply the old West-Saxon, with the vowels levelled to *e*. The northern second person in *-es* is older than the southern and West-Saxon *-est;* but the *-es* of the third person and plural is derived from an older *-eth*, the change of *-th* into *-s* being found in progress in the Durham glosses of the 10th century. In the plural, when accompanied by the pronoun subject, the verb had already dropped the inflexions entirely as in Modern English. The origin of the *-en* plural in the midland dialect, unknown to Old English, has been a matter of conjecture; most probably it is an instance of *form-levelling*, the inflexion of the present indicative being assimilated to that of the past, and the present and past subjunctive, in all of which *-en* was the plural termination. In the declension of nouns, adjectives, and pronouns, the northern dialect had attained before the end of the 13th century to the simplicity of Modern English, while the southern dialect still retained a large number of inflexions, and the midland a considerable number. The dialects differed also in phonology, for while the northern generally retained the hard or guttural values of *k, g, sc,* these were in the two other dialects palatalized before front vowels into *ch, j,* and *sh.* *Kyrk, chirche* or *church; bryg, bridge; scryke, shriek,* are examples. The original *á* in *stân, mâr,* preserved in the northern *stane, mare,* became *o* elsewhere, as in *stone, more.* So that the north presented the general aspect of conservation of old sounds with the most thorough-going dissolution of old inflexions; the south, a tenacious retention of the inflexions, with an extensive revolution in the sounds. In one important respect, however, phonetic decay was far ahead in the north: the final *e* to which all the old vowels had been levelled during the Transition period, and which is a distinguishing feature of Middle English in the midland and southern dialects, became mute, *i. e.*, disappeared, in the northern dialect before the latter emerged from its three centuries of obscuration, shortly before 1300. So thoroughly modern did its form consequently become that we might almost call it Modern English, and say that the Middle English stage of the northern dialect is lost. For comparison with the other dialects, however, the same nomenclature may be used, and we may class as Middle English the extensive literature which northern England produced during the 14th century. The earliest specimen is probably the Metrical Psalter in the Cotton Library,[4] copied during the reign of Edward II. from an original of the previous century. This is followed by the gigantic versified paraphrase of Scripture history called the *Cursor Mundi*,[5] also composed before 1300. The dates of the numerous alliterative romances in this dialect cannot be determined with exactness, as all survive in later copies, but it is probable that many of them are not later than 1300. In the 14th century appeared the theological and devotional works of Richard Rolle the anchorite of Hampole, Dan Jon Gaytrigg, William of Nassington, and other writers whose names are unknown; and towards the close of the century, specimens of the language also appear from Scotland both in public documents and the poetical works of John Barbour, whose language, barring minute points of orthography, is identical with that of the contemporary northern English writers.

In the southern dialect, the work of Layamon was succeeded at an interval estimated at from 15 to 25 years by the *Ancren Riwle* or "Rule of Nuns," written for a small sisterhood at Tarrant-Kaines, in Dorsetshire, in which we find the Middle English stage fully developed, and also recognize a dialectal characteristic which had probably long prevailed in the south, though concealed by the spelling, in the use of *v* for *f*, as *valle*, fall, *vordonne*, fordo, *vorto*, for to, *veder*, father, *vrom*, from. Not till later do we find a recognition of the parallel use of *z* for *s*. Among the writings which succeed, *The Owl and the Nightingale* of Nicholas de Guildford, of Portesham in Dorsetshire, about 1250, the *Chronicle* of Robert of Gloucester, 1298, and Trevisa's translation of Higden, 1387, are of chief importance in illustrating the history of southern English. The earliest form of Langland's *Piers Ploughman*, 1362, as preserved in the Vernon MS., appears to be in an intermediate dialect between southern and midland.[6] The Kentish form of southern English seems to have retained specially archaic features; five short sermons in it of the middle of the 13th century have been published by Rev. Dr. Morris; but the great work illustrating it is the *Ayenbite of Inwyt* (Remorse of Conscience), 1340,[7] of which we are told by its author Dan Michel of Northgate, Kent—

> "Þet þis boc is y-write mid engliss of Kent;
> Þis boc is y-mad uor lewede men,
> Vor uador, and uor moder, and uor oþer ken,
> Ham uor to berȝe uram alle manyere zen,
> Þet ine hare inwytte ne bleue no uoul wen."

[7] Edited by Rev. Dr. Morris for Early English Text Society, in 1866.

In its use of *v* (*u*) and *z* for *f* and *s*, and its grammatical inflexions, it presents an extreme type of southern speech, with vowel peculiarities specially Kentish; and in comparison with contemporary midland English works, it looks like a fossil of two centuries earlier.

Turning from the dialectal extremes of the Middle English to the midland speech, which we left at the closing leaves of the Peterborough *Chronicle* of 1154, we find a rapid development of this dialect, which was before long to become the national literary language. As was natural in a tract of country which stretched from Lancaster to Essex, a very considerable variety is found in the documents which agree in presenting the leading midland features, those of Lancashire and Lincolnshire approaching the northern dialect both in vocabulary, phonetic character, and greater neglect of inflexions. But this diversity diminishes as we advance. The first great work is the *Ormulum*, or metrical Scripture paraphrase of Orm or Ormin, written about 1200, it is generally assumed, in Lincolnshire or Notts, though there is much to be said for the neighborhood of Ormskirk in Lancashire. Anyhow the dialect has a decided smack of the north, and shows for the first time in English literature a large percentage of Scandinavian words, derived from the Danish settlers, who, in adopting English, had preserved a vast number of their ancestral forms of speech, which were in time to pass into the common language, of which they now constitute some of the most familiar words. *Blunt, bull, die, dwell, ill, kid, raise, same, thrive, wand, wing,*[1] are words from this source, which appear first in the work of Orm, of which the following lines may be quoted:—

"Þe Judewisshe folkess boc
  hemm seȝȝde, þatt hemm birrde
Twa bukkes samenn to þe preost
  at kirrke-dure brinngenn;
And teȝȝ þa didenn bliþeliȝ,
  swa summ þe hoc hemm tahhte,
And brohhtenn tweȝȝenn bukkess þær
  Drihhtin þærwiþþ to lakenn.
And att te kirrke-dure toc
  þe preost ta tweȝȝen bukkess,
And o þatt an he leȝȝde þær
  all þeȝȝre sake *and* sinne,
And lét itt eornenn forþwiþþ all
  út inntill wilde wesste;
And toc *and* snaþ þatt oþerr bucc
  Drihhtin þærwiþþ to lakenn.
All þiss wass don forr here ned,
  A*nd* ec forr ure nede;
For hemm itt hallp biforenn Godd
  to clennssenn hemm of sinne;
And all swa maȝȝ itt hellpenn þe
  ȝiff þatt tu willt [itt] follȝhenn.
ȝiff þatt tu willt full inwarrdliȝ
  wiþþ fulle trowwþe lefenn
All þatt tatt wass bitacnedd tær,
  to lefenn *and* to trowwenn."

White's Ormulum, l. 1324.

The author of the *Ormulum* was a phonetist, and employed a special spelling of his own to represent not only the quality but the *quantities* of vowels and consonants,—a circumstance which gives his work a peculiar value to the investigator.

Thirty years after the *Ormulum*, the east midland rhymed *Story of Genesis and Exodus*[2] shows us a dialect in a more southern form, with the vowels of modern English. In 1258 was issued the celebrated English proclamation of Henry III., or rather of Simon de Montfort in his name, which, as the only public recognition of the native tongue between William the Conqueror and Edward III., has been spoken of as the first specimen of English. It runs—

"Henr*i* þurȝ godes fultume king on Engleneloande. Lhoauerd on Yrloande. Duk on Norm*andie* on Aquitaine and eorl on Aniow. Send igretinge to alle hise holde ilærde and ileawede on Huntendoneschire. þæt witen ȝe wel alle þæt *we* willen and vnne*n* þæt þæt vre rædesmen alle oþer þe moare dæl of heom þæt beoþ ichosen þurȝ us and þurȝ þæt loandes folk on vre kunerriche. habbeþ idon and schullen don in þe worþnesse of good and on vre treowþe. for þe freme of þe loande. þurȝ þe besiȝte of þan to-foren-iseide redesmen. beo stedefæst and ilestinde in alle þinge a buten ænde. And we hoaten alle vre treowe in þe treowþe þæt heo vs oȝen. þæt heo stedefæstliche healden and swerien to healden and to werien þo isetnesses þæt beon imakede and beon to makien þurȝ þan to-foren iseide rædesmen. oþer þurȝ þe moare dæl of heom alswo alse hit is biforen iseid. And þæt æhc oþer helpe þæt for to done bi þan ilche oþe aȝenes alle men. Riȝt for to done and to foangen. And noan ne nime of loande ne of eȝte. wherþurȝ þis besiȝte muȝe beon ilet oþer iwersed on onie wise. And ȝif oni oþer onie cumen her onȝenes; we willen and hoaten þæt alle vre treowe heom healden deadliche ifoan. And for þæt we willen þæt þis beo stedefæst and lestinde; we senden ȝew þis writ open iseined wiþ vre seel. to halden amanges ȝew ine hord. Witnesse vs seluen æt Lunden*e*. þane Eȝtetenþe day. on þe Monþe of Octob*re* In þe Two-and-fowertiȝþe ȝeare of vre cruninge. And þis wes idon ætforen vre isworene redesmen. . . .

"And al on þo ilche worden is isend in to æurihce oþre shcire ouer al þære kuneriche on Engleneloande. and ek in tel Irelonde."

As to the dialect of this document it is more southern than anything else, with a slight midland admixture, and represents no doubt the London speech of the day. London being in a Saxon county, and contiguous to the Saxon Kent and Surrey, had certainly at first a southern dialect: but its position as the capital, as well as its proximity to the midland district, made its dialect more and more midland. Even in Chaucer, however, it has still southern features, for Chaucer's language is well known to be more southern than standard English eventually became. Inflexionally, the proclamation is much more archaic than the *Genesis and Exodus* or *Ormulum;* but it closely resembles the old Kentish Sermons and *Proverbs of Alfred* in the southern dialect of 1250.

In the writings of the second half of this century, the language becomes rapidly more modern in aspect, till we arrive about 1300 at the name of Robert of Brunne in south Lincolnshire, with whom we pass from the Early to the Later Middle English. Different tests and different dates have indeed been proposed for subdividing the Middle English, but the most important is that of Mr. Henry Nicol, based on the discovery that in the 13th century, as in Ormin, the Old English short vowels in an open syllable still retained their short quantity, as *năma, ŏver, mĕte;* but by the beginning of the 14th century they were lengthened to *nā-me, ō-ver, mē-te*, a change which has also taken place at a particular period in all the Teutonic, and even the Romance languages, as in *buō-no* for *bŏ-num, cā-ne* for *că-nem*, etc. The lengthening of the penult left the final syllable by contrast shortened or weakened, and paved the way for the disappearance of final *e* in the century following through the stages *na-me, nāmĕ, nā-m', nām*, the one long syllable in *nam*(*e*) being the quantitative equivalent of the two short syllables in *nă-mĕ;* and thus came the idea that mute *e* makes a preceding vowel long, the truth being that the lengthening of the vowel made the *e* mute. The late Middle English produced the prose of Mandeville and Wycliffe, and the poetry of Chaucer, with whom it may be said to have culminated, and in whose writings its main characteristics as distinct from Old and Modern English may be studied. Thus, we find final *e* in full use representing numerous original vowels and terminations as

Him thoughtè that his hertè woldè brekè,

in Old English—

Him þuhte þæt his heorte wolde brecan,

which may be compared with the modern German—

Ihm däuchte dasz sein Herze wollte brechen.

In nouns the *-es* of the plural and genitive case is still syllabic—

Reede as the berstl-es of a sow-es eer-es.

Several old genitives and plural forms continued to exist, and the dative or prepositional case often has a final *e*. Adjectives retain so much of the old declension as to have *-e* in the definite form and in the plural—

The tend-re cropp-es and the yong-e sonne.
And smal-e fowl-es maken melodie.

Numerous old forms of comparison were in use, which have not come down to Modern English, as *herre, ferre, lenger, hext* = higher, farther, longer, highest. In the pronouns,

---

[1] See a list in Mr. Kington Oliphant's *Sources of Standard English*, p. 97, a work in which the history of Middle English is admirably developed.

[2] Edited for the Early English Text-Society by Dr. Morris, 1865.

ich lingered alongside of *I; ye* was only nominative, and *you* objective; the northern *thei* had dispossessed the southern *hy*, but *her* and *hem* (the modern *'em*) stood their ground against *their* and *them.* The verb is *I lov-e, thou lov-est, he lov-eth;* but in the plural *lov-en* is interchanged with *lov-e*, as rhyme or euphony requires. So in the plural of the past *we love-den* or *love-de.* The infinitive also ends in *en*, often *e*, always syllabic. The present participle, in Old English *-ende*, passing through *-inde*, has been confounded with the verbal noun in *-ynge, -yng*, as in Modern English. The past participle largely retains the prefix *y-* or *i-*, representing the Old English *ge-*, as in *i-ronne, y-don*, run, done. Many old verb forms still continued in existence. The adoption of French words, not only those of Norman introduction, but those subsequently introduced under the Angevin kings, to supply obsolete and obsolescent English ones, which had kept pace with the growth of literature since the beginning of the Middle English period, had now reached its climax; later times added many more, but they also dropped many that were in regular use with Chaucer and his contemporaries.

Chaucer's great contemporary, William Langland, in his *Vision of William concerning Piers the Ploughman*, and his imitator the author of *Pierce the Ploughman's Crede* (about 1400) used the Old English alliterative versification for the last time in the south. Rhyme had made its appearance in the language shortly after the Conquest—if not already known before; and in the south and midlands it became decidedly more popular than alliteration; the latter retained its hold much longer in the north, where it was written even after 1500: many of the northern romances are either simply alliterative, or have both alliteration and rhyme. To these characteristics of northern and southern verse respectively Chaucer alludes in the prologue of the "Persone," who, when called upon for his tale, said—

> "But trusteth wel; I am a sotherne man,
> I cannot geste *rom, ram, ruf*, by my letter,
> And, God wote, rime hold I but litel better:
> And therfore, if you list, I wol not glose,
> I wol you tell a litel tale in prose."

The changes from Old to Middle English may be summed up thus:—Loss of a large part of the native vocabulary, and adoption of French words to supply the blank; not infrequent adoption of French words as synonyms of existing native ones; modernization of the English words preserved, by vowel change in a definite direction from back to front, and from open to close, *a* becoming *o, o* tending to *oo, u* to *ou, ea* to *é, é* to *ee, ee* to *ī*, and by advance of consonants from guttural to palatal; obscuration of vowels after the accent, and especially of final *a, o, u* to *ĕ;* consequent confusion and loss of old inflexions, and their replacement by prepositions, auxiliary verbs, and rules of position; abandonment of alliteration for rhyme; and great development of dialects, in consequence of there being no standard or recognized type of English.

But the recognition came at length. By the reign of Edward III., French was so little known in England, even in the families of the great, that about 1350 "John Cornwal, a maystere of gramere, chaungede þe lore in gramere scole *and* construccion of [*i. e., from*] Freynsch into Englysch;"[1] and in 1362–3 English by statute took the place of French in the pleadings in courts of law. Every reason conspired that this "English" should be the midland dialect. It was the intermediate dialect, intelligible, as Trevisa has told us, to both extremes, even when these failed to be intelligible to each other; in its south-eastern form, it was the language of London, where the supreme law courts were, the centre of political and commercial life; it was the language in which the Wycliffite versions had given the Holy Scriptures to the people; the language in which Chaucer had raised English poetry to a height of excellence admired and imitated by contemporaries and followers. And accordingly after the end of the 14th century, all Englishmen who thought they had anything to say worth listening to said it in the midland speech. Trevisa's own work was almost the last literary effort of the southern dialect; henceforth it was but a rustic patois, which the dramatist might use to give local coloring to his creations, as Shakespeare uses it to complete Edgar's peasant disguise in *Lear*, or which 19th century research might disinter to illustrate obscure chapters in the history of language. And though the northern English proved a little more stubborn, it disappeared also from literature in England; but in Scotland, which had now become politically and socially estranged from England, it continued its course as the national language of the country, attaining in the 15th and 16th centuries a distinct development and high literary culture, for the details of which readers are referred to the article on SCOTTISH LANGUAGE.

The 15th century of English history, with its bloody French war abroad, and Wars of the Roses at home, was a barren period in literature, and a transition one in language, witnessing the decay and disappearance of the final *e*, and most of the syllabic inflexions of Middle English. Already by 1420, in Chaucer's disciple Hoccleve, final *e* was quite uncertain; in Lydgate it was practically gone. In 1450 the writings of Pecocke against the Wycliffites show the verbal inflexions in *-en* in a state of obsolescence; he has still the southern pronouns *her* and *hem* for the northern *their, them* :—

"And here-aȝens holi scripture wole þat men schulden lacke þe coueryng which wommen schulden haue, & thei schulden so lacke-bi þat þe heeris of her heedis schulden be schorne, & schulde not growe in lengþe doun as wommanys heer schulde growe. . . .

"Also here-wiþal into þe open siȝt of ymagis in open chirchis, alle peple, men & wommen & children mowe come whanne euere þei wolen in ech tyme of þe day, but so mowe þei not come in-to þe vce of bokis to be delyuered to hem neiþer to be red bifore hem; & þerfore, as for to soone & ofte come into remembraunce of a long mater bi ech oon persoon, and also as forto make þat þe mo persoones come into remembraunce of a mater, ymagis & picturis serven in a specialer maner þan bookis doon, þouȝ in an oþer maner ful substanciali bokis seruen better into remembrauncing of þo same materis þan ymagis & picturis doon; & þerfore, þouȝ writingis seruen weel into remembrauncing upon þe bifore seid þingis, ȝit not at þe ful: Forwhi þe bokis han not þe avail of remembrauncing now seid whiche ymagis han."[2]

The change of the language during the second period of Transition, as well as the extent of dialectal differences, is quaintly expressed a generation later by Caxton, who in the prologue to one of the last of his works, his translation of Virgil's *Eneydos* (1490), speaks of the difficulty he had in pleasing all readers:—

"I doubted that it sholde not please some gentylmen, whiche late blamed me, sayeng, y^{t} in my translacyons I had ouer curyous termes, whiche coud not be vnderstande of comyn peple, and desired me to vse olde and homely termes in my translacyons. And fayn wolde I satysfy euery man; and so to doo, toke an olde boke and redde therin; and certaynly the englysshe was so rude and brood that I coude not wele vnderstande it. And also my lorde abbot of Westmynster ded do shewe to me late certayn euydences wryton in olde englysshe for to reduce it in to our englysshe now vsid. And certaynly it was wreton in suche wyse that it was more lyke to dutche than englysshe; I coude not reduce ne brynge it to be vnderstonden. And certaynly, our langage now vsed varyeth ferre from that whiche was vsed and spoken whan I was borne. For we englysshemen ben borne vnder the domynacyon of the mone, whiche is neuer stedfaste, but euer wauerynge, wexynge one season, and waneth and dycreaseth another season, And that comyn englysshe that is spoken in one shyre varyeth from a nother. In so much that in my days happened that certayn marchauntes were in a shipe in tamyse, for to haue sayled ouer the sea into zelande, and for lacke of winde thei taryed atte forlond, and wente to lande for to refreshe them. And one of theym named sheffelde, a mercer, cam in to an hows and axed for mete, and specyally he axyd after eggys, And the goode wyf answerde, that she coude speke no frenshe. And the marchaunt was angry, for he also coude speke no frenshe, but wolde haue hadde egges; and she vnderstode hym not. And thenne at laste a nother sayd that he wolde haue eyren; then the good wyf sayd that she vnderstod hym wel. Loo! what sholde a man in thyse dayes now wryte, egges or eyren? certaynly, it is harde to playse euery man, by cause of dyuersite & chaunge of langage. For in these dayes, euery man that is in ony reputacyon in his countre wyll vtter his comynycacyon and maters in suche maners & termes that fewe men shall vnderstonde theym. And som honest and grete clerkes haue ben wyth me, and desired me to wryte the moste curyous termes that I coude fynde. And thus bytwene playn, rude, and curyous, I stande abasshed; but in my Judgemente, the comyn termes that be dayli vsed ben lyghter to be vnderstonde than the olde and auncyent englysshe."

---

[1] Trevisa, *Translation of Higden's Polychronicon.*

[2] Skeat, *Specimens of English Literature*, pp. 49, 54.

In the productions of Caxton's press we see the passage from Middle to Modern English completed. The earlier of these have still an occasional verbal plural in *-n*, especially in the word *they ben;* the southern *her* and *hem* of Middle English vary with the northern and Modern English *their*, *them.* In the late works, the older forms have been practically ousted, and the year 1485, which witnessed the establishment of the Tudor dynasty, may be conveniently put as that which closed the Middle English transition, and introduced Modern English. Both in the completion of this result, and in its comparative permanence, the printing press had an important share. By its exclusive patronage of the midland speech, it raised it still higher above the sister dialects, and secured its abiding victory. As books were multiplied and found their way into every corner of the land, and the art of reading became a more common acquirement, the man of Northumberland or of Somersetshire had forced upon his attention the book-English in which alone these were printed. This became in turn the model for his own writings, and by and by, if he made any pretensions to education, of his own speech. The written *form* of the language also tended to uniformity. In previous periods the scribe made his own spelling with a primary aim at expressing his own speech, according to the particular values attached by himself or his contemporaries to the letters and combinations of the alphabet, though liable to disturbance in the most common words and combinations by his ocular recollections of the spelling of others. But after the introduction of printing, this ocular recognition of words became ever more and more an aim; the book addressed the mind directly through the eye, instead of circuitously through eye and ear; and thus there was a continuous tendency for written words and parts of words to be reduced to a single form, and that the most usual, or through some accident the best known, but not necessarily that which would have been chosen had the *ear* been called in as umpire. Modern English spelling, with its rigid uniformity as to individual results and whimsical caprice as to principles, is the creation of the printing-office, the victory which, after a century and a half of struggle, mechanical convenience won over natural habits. Besides eventually creating a uniformity in writing, the introduction of printing made or at least ratified some important changes. The British and Old English form of the Roman alphabet has already been referred to. This at the Norman Conquest was superseded by an alphabet with the French forms and values of the letters. Thus *k* took the place of the older *c* before *e* and *i; qu* replaced *cw;* the Norman *w* took the place of the *wên* (þ), etc. But there were certain sounds in English for which Norman writing had no provision; and for these, in writing English, the native characters were retained. Thus the Old English g (ᵹ), beside the sound in *go*, had a guttural sound as in German ta*g*, Irish ma*gh*, and in certain positions a palatalized form of this approaching *y* as in *y*ou (if pronounced with aspiration *hy*ou or *ghy*ou). These sounds continued to be written with the native form of the letter as *burȝ*, *ȝour*, while the French form was used for the sounds in *go*, *age*,—one original letter being thus split into two. So for the sounds of *th*, especially the sound in *th*at, the Old English *thorn* (þ) continued to be used. But as these characters were not used for French and Latin, their use even in English became disturbed towards the 15th century, and when printing was introduced, the founts, cast for Continental languages, had no characters for them, so that they disappeared entirely, being replaced, ȝ by *gh*, *yh*, *y*, and þ by *th*. This was a real loss to the English alphabet. In the north it is curious that the printers tried to express the *forms* rather than the powers of these letters, and consequently ȝ was represented by *z*, the black letter form of which was confounded with it, while the þ was expressed by *y*, which its MS. form had come to approach or in some cases simulate. So in early Scotch books we find *zellow*, *ze*, *yat*, *yem*, = *yellow*, *ye*, *that*, *them*.

MODERN ENGLISH thus dates from Caxton. The language had at length reached the all but inflexionless state which it now presents. A single older verbal form, the southern *-eth* of the third person singular, continued to be the literary prose form throughout the 16th century, but the northern form in *-s* was intermixed with it in poetry (where it saved a syllable), and must ere long, as we see from Shakespeare, have taken its place in familiar speech. The fuller *an*, *none*, *mine*, *thine*, in the early part of the 16th century at least, were used in positions where their contracted forms, *a*, *no*, *my*, *thy*, are now found. But with such minute exceptions, the accidence of the 16th century was the accidence of the 19th. While, however, the older inflexions had disappeared, there was as yet no general agreement as to the mode of their replacement. Hence the 16th century shows a syntactic license and freedom which distinguishes it strikingly from that of later times. The language seems to be in a plastic, unformed state, and its writers, as it were, experiment with it, bending it to constructions which now seem indefensible. Old distinctions of case and mood have disappeared from noun and verb, without fashion having yet decided what prepositions or auxiliary verbs shall most fittingly convey their meaning. The laxity of word-order which was permitted in older states of the language by the *formal* expression of relations was often continued, though the inflexions which expressed the relations had disappeared. Partial analogy was followed in allowing forms to be identified in one case, because, in another, such identification was accidentally produced, as for instance the past participles of *write* and *take* were made *wrote* and *took*, because the contracted participles of *bind* and *break* were *bound* and *broke.* Finally, because, in dropping inflexions, the former distinctions even between parts of speech had disappeared, so that *iron*, *e.g.*, was at once noun, adjective, and verb, *clean*, adjective, verb, and adverb, it appeared as if any word whatever might be used in any grammatical relation, where it conveyed the idea of the speaker. Thus, as has been pointed out by Dr. Abbott, "you can *happy* your friend, *malice* or *foot* your enemy, or *fall* an axe on his neck. You can speak and act *easy*, *free*, *excellent*, you can talk of *fair* instead of beauty (fairness), and a *pale* instead of a *paleness.* A *he* is used for a man, and a lady is described by a gentleman as 'the fairest *she* he has yet beheld.' An adverb can be used as a verb, as 'they *askance* their eyes;' as a noun, 'the *backward* and abyss of time;' or as an adjective, a '*seldom* pleasure.'"[1] For, as he also says, "clearness was preferred to grammatical correctness, and brevity both to correctness and clearness. Hence it was common to place words in the order in which they came uppermost in the mind without much regard to syntax, and the result was a forcible and perfectly unambiguous but ungrammatical sentence, such as

> The prince that feeds great natures they will slay him.
> *Ben Jonson.*

or, as instances of brevity,

> Be guilty of my death since of my crime.
> *Shakespeare.*
>
> It costs more to get than to lose in a day.
> *Ben Jonson.*"

These characteristics, together with the presence of words now obsolete or archaic, and the use of existing words in senses different from our own, as general for specific, literal for metaphorical, and *vice versâ*, which are so apparent to every reader of the 16th century literature, make it useful to separate *Early Modern* or *Tudor* English from the subsequent and still existing stage, since the consensus of usage has declared in favor of individual senses and constructions which are alone admissible in ordinary language.

The commencement of the Tudor period was contemporaneous with the Renaissance in art and literature, and the dawn of modern discoveries in geography and science. The revival of the study of the classical writers of Greece and Rome, and the translation of their works into the vernacular, led to the introduction of an immense number of new words derived from these languages, either to express new ideas and objects, or to indicate new distinctions in or groupings of old ideas. Often also it seemed as if scholars were so pervaded with the form as well as the spirit of the old, that it came more natural to them to express themselves in words borrowed from the old than in their native tongue, and thus words of Latin origin were introduced even when English already possessed perfectly good equivalents. As has already been stated, the French words of Norman and Angevin introduction, being principally Latin words in an altered form, when used as English supplied models whereby other Latin words could be converted into English ones, and it is after these models that the Latin words introduced during and since the 16th century have been fashioned. There is nothing in the *form* of the words *procession* and *progression* to show that the one was used in England in the 11th, the other not till the 16th century. Moreover, as the formation of new words from Latin has gone on in French as well as in English since the Renaissance, we cannot tell whether such words, *e.g.*, as *persuade* and *persuasion*, were borrowed from their French equivalents or formed in England independently. With some words indeed it is impossible to say whether they were formed in England directly from Latin, borrowed from contemporary late French, or had been in England since the Norman period; even *photograph*, *geology*, and *telephone* have the form that they would have had if they had been living words in the mouths of Greeks, Latins, French, and English from the beginning, instead of formations of the 19th century.[1] While every writer was thus introducing new words according to his idea of their being needed, it naturally happened that a large number were not accepted by contemporaries or posterity; a portentous list might be formed of these mintages of the 16th and 17th centuries, which either never became current coin, or circulated only as it were for a moment.

---

[1] *A Shakspearian Grammar*, by E. A. Abbott, M.A. To this book we are largely indebted for its admirable summary of the characters of Tudor English.

The voyages of English navigators in the latter part of the 16th century also introduced a considerable number of Spanish words, and American words in Spanish forms, of which *potato, tobacco, cargo, armadillo, alligator, galleon* may serve as examples.

The date of 1611, which coincides with the end of Shakespeare's literary work and the appearance of the Authorized Version of the Bible (a compilation from the various 16th century versions), may be taken as marking the close of Tudor English. The language was thenceforth Modern in structure, style, and expression, although the spelling did not settle down to present usage till about the Restoration. The distinctive features of Modern English have already been anticipated by way of contrast with preceding stages of the language. It is only necessary to refer to the fact that the vocabulary is now much more composite than at any previous period. The immense development of the physical sciences has called for a corresponding extension of terminology which has been supplied from Latin and especially Greek; and although these terms are in the first instance *technical*, yet with the spread of education and general diffusion of the rudiments and appliances of science, the boundary line between *technical* and *general*, indefinite at the best, tends more and more to melt away, in addition to the fact that words still technical become general in figurative or metonymic senses. *Ache, diamond, stomach, comet, organ, tone, ball, carte,* are none the less familiar because once technical words. Commercial, social, artistic, or literary contact has also led to the adoption of numerous words from modern European languages, especially French, Italian, Portuguese, Dutch (these two at a less recent period): thus from French *soirée, séance, dépôt, débris, programme, prestige;* from Italian *bust, cartoon, concert, regatta, ruffian;* from Portuguese *caste, palaver;* from Dutch *yacht, skipper, schooner, sloop.* Commercial intercourse and colonization have extended far beyond Europe, and given us words more or fewer from Hindu, Persian, Arabic, Turkish, Malay, Chinese, and from American, Australian, Polynesian, and African languages.[2] More important even than these perhaps are the dialectal words that from time to time obtain literary recognition, restoring to us obsolete Old English forms, and not seldom words of Celtic or Danish origin, which have been preserved in local dialects, and thus at length find their way into the standard language. As to the actual proportion of the various elements, it is probable that original English words do not now form more than a third or perhaps a fourth of the total entries in a full English dictionary; and it might seem strange, therefore, that we still identify the language with that of the 9th century, and class it as a member of the *Low German* division. But this explains itself, when we consider that of the total words in a dictionary only a small portion are used by any one individual in speaking or even in writing; that this portion includes *all* or nearly all the Anglo-Saxon words, and but a small fraction of the others. The latter are in fact almost all *names*,—the vast majority names of *things* (nouns), a smaller number names of *attributes* and *actions* (adjectives and verbs), and, from their very nature, names of the things, attributes, and actions which come less usually or very rarely under our notice. Thus in an ordinary book, a novel or story, the foreign elements will amount to from 10 to 15 per cent. of the whole; as the subject becomes more recondite or technical their number will increase; till in a work on chemistry or abstruse mathematics the proportion may be 40 per cent. But after all, it is not the question whence words *may* have been taken, but *how they are used* in a language that settles its character. If new words when adopted conform themselves to the manner and usage of the adopting language, it makes absolutely no difference whether they are transferred from some other language, or invented off at the ground. In either case they are *new* words to begin with; in either case also, if they are needed, they will become as thoroughly native, *i. e.*, familiar from childhood to those who use them, as those that possess the longest native pedigree. In this respect English is still strictly the same language it was in the days of Alfred; and comparing its history with that of other Low German dialects, there is no reason to believe that its grammar or structure would have been different, however different its vocabulary might have been, if the Norman Conquest had never taken place.

The preceding sketch has had reference mainly to the *inflexional* changes which the language has undergone; distinct from, though intimately connected with these (as where the confusion or loss of inflexions was a consequence of the weakening of final sounds) are the great phonetic changes which have taken place between the 8th and 19th centuries, and which result in making modern English words very different from their Anglo-Saxon originals, even where no element has been lost, as in words like *stone, mine, doom, day, child, bridge, shoot,* A.-S. *stán, mín, dóm, dæg, cild, brycg, scéot.* The history of English sounds has been treated at length by Mr. A. J. Ellis and Mr. Henry Sweet[3] (with whose results those of Dr. Weymouth[4] should be compared); and it is only necessary here to indicate the broad facts, which are the following. (1) In an accented closed syllable, original short vowels have remained nearly unchanged; thus the words *at, men, bill, God, dust,* are pronounced now nearly as in O. E., though the last two were more like the Scotch *o* and North English *u* respectively, and in most words the short *a* had a broader sound like the provincial *a* in *man.* (2) Long accented vowels and diphthongs have undergone a regular *laut verschiebung* or shift towards higher and more advanced positions, so that the words *bán, hær, soece,* or *séce, stól* (*i.e., bahn* or *bawn, hêr, sök* and *saik, stōle*) are now *bōne, hair, seek, stool;* while the two high vowels *ú* (= *oo*) and *i* (*ee*) have become diphthongs, as *hús, scír,* now *house, shire,* though the old sound of *u* remains in the north (*hoose*), and the original *i* in the pronunciation *sheer*, approved by Walker, "as in machine, and shire, and magazine." (3) Short vowels in an open syllable have usually been lengthened, as in *nă-ma, cŏ-fa,* now *name, cove;* but to this there are many exceptions. (4) Vowels in terminal unaccented syllables have all sunk into short obscure *ĕ*, and then, if final, disappeared; so *oxa, séo, wudu,* became *ox-e, se-e, wood-e,* and then *ox, see, wood; oxan, lufod,* now *oxen, loved, lov'd; writan, writon,* later *writ-en, writ-e,* now *write, i.e., wrīt.* (5) The back consonants, *c, g, sc,* in connection with front vowels, have often become palatalized to *ch, j, sh,* as *circe, rycg, fisc,* now *church, ridge, fish.* A final *g* has passed through a guttural or palatal continuant to *w* or *y*, forming a diphthong or new vowel, as in *boga, laga, dæg, heg, drig,* now *bow, law, day, hay, dry.* *W* and *h* have disappeared before *r* and *l*, as in *write, wlisp; h* final (= *gh*) has become *f, k, w,* or nothing, as *ruh, hoh, boh, deah, heah,* now *rough, hough, bough, dough, high* = *ruf, hok, bŏw, dō, hī.* *R* after a vowel has practically disappeared in standard English, or at most become vocalized, or combined with the vowel, as in *hear, bar, more, her.* These and other changes have taken place gradually, and in accordance with well-known phonetic laws; the details as to time and mode may be studied in the special works already named. It may be mentioned that the total loss of grammatical *gender* in English, and the almost complete disappearance of *cases*, are purely phonetic phenomena. *Gender* was practically (whatever its remote origin) the use of adjectives and pronouns with certain distinctive terminations, in accordance with the *kind* of nouns to which they were attached; when these distinctive terminations were uniformly levelled to final ĕ, or other weak sounds, and thus ceased to distinguish nouns into kinds, the distinction into kinds having no other existence disappeared. Thus when *þæt gode hors, þone godan hund, þa godan bóc*, became, by phonetic weakening, *þe goode hors, þe goode hownd, þe goode boke*, the words *horse, hound, book* were no longer different *kinds* of nouns; grammatical gender had ceased to exist. The concord of the pronouns is now regulated by *rationality* and *sex*, instead of gender which has no existence in English. The man *who* lost *his* life; the bird *which* built *its* nest.

---

[1] *Evangelist, astronomy, dialogue,* are words that have so lived, of which their form is the result. *Photograph*, etc., take this form *as if* they had the same history.

[2] See extended lists of the foreign words in English in Dr. Morris's *Historical Outlines of English Accidence*, p. 33.

[3] See list of works at the end of this article. An important work by Mr. Henry Nicol, on the history of "French Sounds in English," is in course of publication for the Philological Society.

[4] *On Early English Pronunciation*, etc., by R. F. Weymouth, D. Lit., M.A., London, 1874, and paper *On "Here" and "There" in Chaucer*, Phil. Soc., 1877.

Our remarks from the end of the 14th century have been confined to the standard or literary form of English, for of the other dialects from that date (with the exception of the northern English in Scotland, where it became in a social and literary sense a distinct language) we have no history. We know, however, that they continued to exist as local and popular forms of speech, as well from the fact that they exist still as from the statements of writers during the interval. Thus Puttenham in his *Arte of English Poësie*, 1589, says—

> "Our maker [*i.e.*, poet] therfore at these dayes shall not follow Piers Plowman, nor Gower, nor Lydgate, nor yet Chaucer, for their language is now not of use with us: neither shall he take the termes of Northern-men, such as they use in dayly talke, whether they be noble men or gentle men or of their best clarkes, all is a [= one] matter; nor in effect any speach used beyond the river of Trent, though no man can deny but that theirs is the purer English Saxon at this day, yet it is not so Courtly nor so currant as our *Southerne* English is, no more is the far Westerne mans speach: ye shall therefore take the usual speach of the Court, and that of London and the shires lying about London within lx myles, and not much above. I say not this but that in every shyre of England there be gentlemen and others that speake but specially write as good Southerne as we of Middlesex or Surrey do, but not the common people of every shire, to whom the gentlemen, and also their learned clarkes do for the most part condescend, but herein we are already ruled by th' English Dictionaries and other bookes written by learned men."—*Arber's Reprint*, p. 157.

In comparatively modern times, there has been a revival of interest in these long neglected forms of English, several of which, following in the wake of the revival of Lowland Scotch last century, have produced a considerable literature in the form of local poems, tales, and "folk-lore." In these respects Lancashire, Cumberland, Yorkshire, Devonshire, and Dorsetshire, the "far north" and "far west" of Puttenham, where the dialect was felt to be so independent of literary English as not to be branded as a vulgar corruption of it, stand prominent. More recently the dialects have been investigated philologically, a department in which, as in English philology generally, the name of Richard Garnett takes the lead. The work has been carried out zealously by Prince Louis Lucien Bonaparte, Mr. A. J. Ellis, and the Rev. W. W. Skeat, to whom is due the foundation of a Dialect Society for the investigation of this branch of Philology. The researches of Prince L. L. Bonaparte and Mr. Ellis have resulted in the classification and mapping of the existing dialects.[1] They recognize a *Northern* dialect lying north of a line drawn from Morecambe Bay to the Humber, which, with the kindred Scottish dialects (already investigated and classed),[2] is the direct descendant of early northern English, and a *South-western* dialect occupying Somerset, Wilts, Dorset, Gloucester, and western Hampshire, which, with the *Devonian* dialect beyond it, are the descendants of early southern English and the still older West-Saxon of Alfred. This dialect must in the 14th century have been spoken everywhere south of Thames; but the influence of London caused its extinction in Surrey, Sussex, and Kent, so that already in Puttenham it had become "far western." An *East Midland* dialect, extending from south Lincolnshire to London, occupies the cradle-land of the standard English speech, and still shows least variation from it. Between and around these typical dialects are ten others, representing the old Midland proper, or dialects between it and the others already mentioned. Thus "north of Trent" the *North-western* dialect of south Lancashire, Cheshire, Derby, and Stafford, with that of *Shropshire*, represents the early West Midland English, of which several specimens remain; while the *North-eastern* of Nottingham and north Lincolnshire represents the dialect of the *Lay of Havelok.* With the *North Midland* dialect of south-west Yorkshire, these represent forms of speech which to the modern Londoner, as to Puttenham, are still decidedly northern, though properly intermediate between northern and midland, and preserving interesting traces of the midland pronouns and verbal inflexions. There is an *Eastern* dialect in the East Anglian counties; a *Midland* in Leicester and Warwick shires; a *Western* in Hereford, Worcester, and north Gloucestershire, intermediate between south-western and north-western, and representing the dialect of *Piers Plowman.* Finally, between the east midland and south-western, in the counties of Buckingham, Oxford, Berks, Hants, Surrey, and Sussex, there is a dialect which must have once been south-western, but of which the most salient characters have been rubbed off by proximity to London and the East Midland speech. In east Sussex and Kent this *South-eastern* dialect attains to a more distinctive character. The *Kentish* form of early Southern English evidently maintained its existence more toughly than that of the counties immediately south of London. If we can trust the fidelity of the dialect attributed to Edgar in *Lear*, it was still strongly marked in the days of Shakespeare. In the south-eastern corner of Ireland, in the baronies of Forth and Bargy, in county Wexford, a very archaic form of English, of which specimens have been preserved,[3] was still spoken in the present century. In all probability it dated from the first English invasion. In many parts of Ulster forms of Lowland Scotch dating to the settlement under James I. are still spoken; but the English of Ireland generally seems to represent 16th and 17th century English, as in the pronunciation of *tea, wheat* (*tay, whait*), largely affected of course by the native Celtic. Beyond the limits of the British Isles, English is the language of extensive regions, now or formerly colonies. In all these countries the presence of numerous new objects and new conditions of life has led to the supplementing of the vocabulary by the adoption of words from native languages, and special adaptation of English words. The use of a common literature, however, prevents the overgrowth of these local peculiarities, and also makes them familiar to Englishmen. It is only in the older States of the American Union that anything like a local dialect has been produced; and even there the so-called Yankee dialect, and Americanisms, are much more archaic English forms which have been lost or have become dialectal in England than a development of the American soil.

The steps by which English, from being the language of a few thousand invaders along the eastern and southern seaboard of Britain, has been diffused by conquest and colonization over its present area form a subject too large for the limits of this article. It need only be remarked that within the confines of Britain itself the process is not yet complete. Representatives of earlier languages survive in Wales and the Scottish Highlands, though in neither case can the substitution of English be remote. In Ireland, where English was introduced by conquest much later, Irish is still spoken in patches all over the country; though English is understood, and probably spoken after a fashion, everywhere. At opposite extremities of Britain the Cornish of Cornwall and the Norse dialects of Orkney and Shetland died out very gradually in the course of last century. The Manx, or Celtic of Man, is even now in the last stage of dissolution; and in the Channel Isles the Norman *patois* of Jersey and Guernsey have largely yielded to English within the last thirty years.

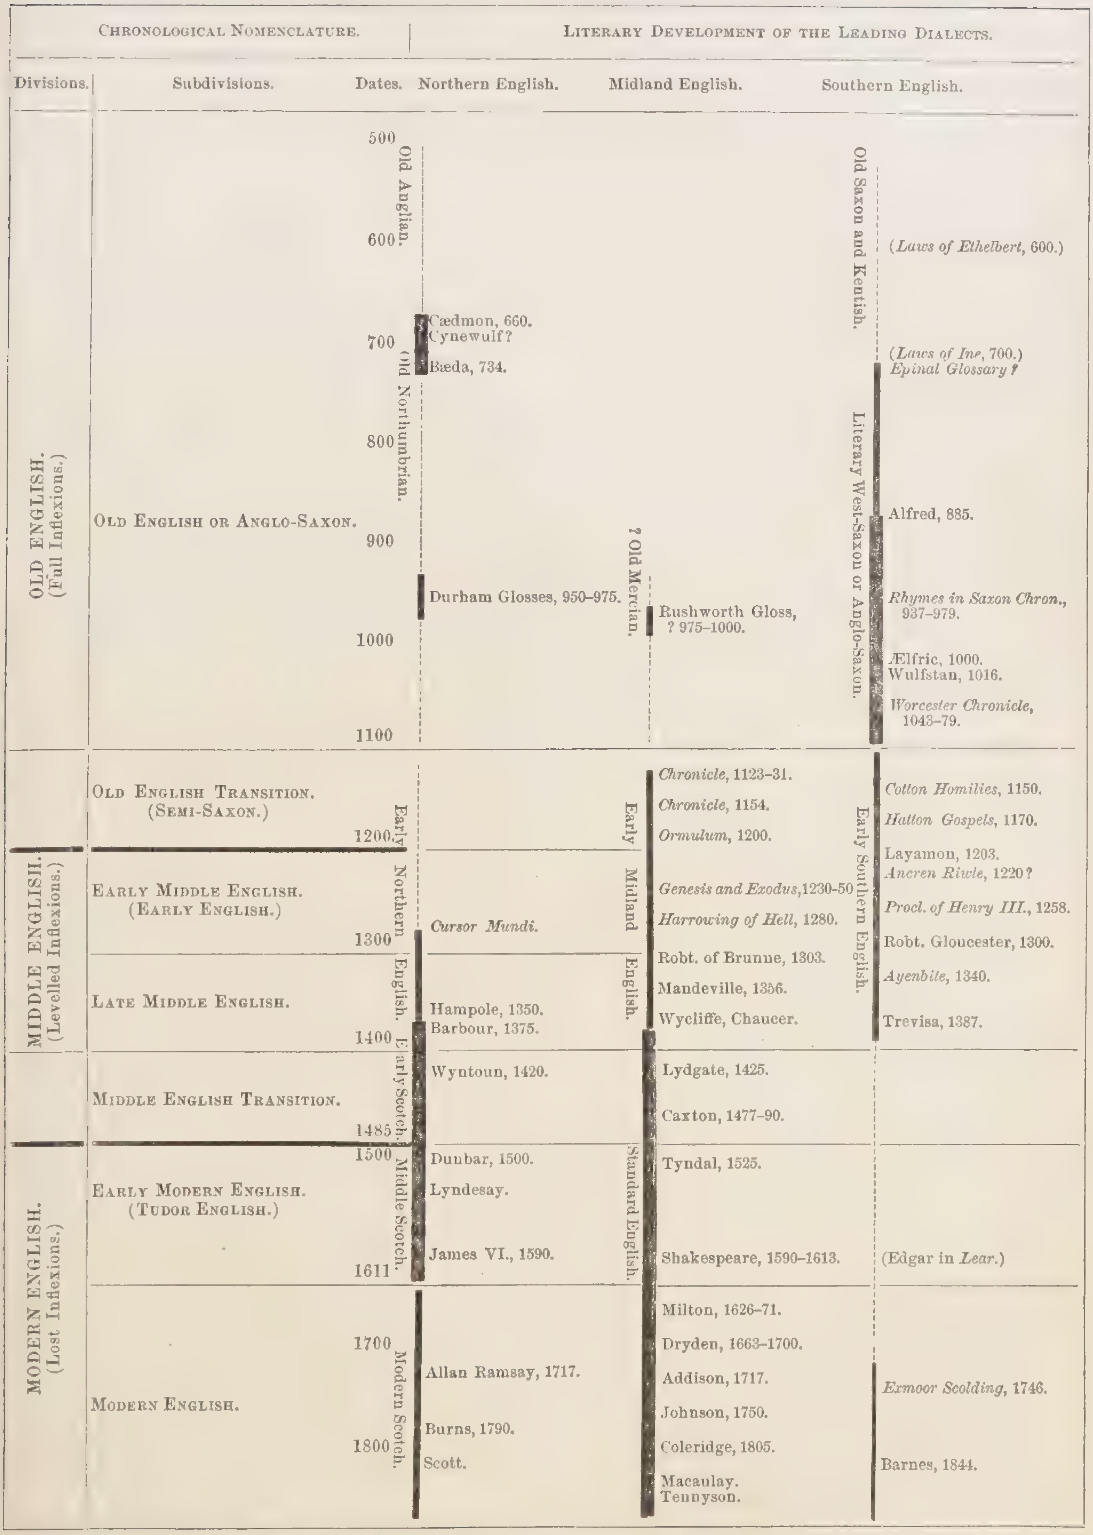
[2] *The Dialect of the Southern Counties of Scotland, its Pronunciation, Grammar, and Historical Relations, with an Appendix on the present limits of the Gaelic and Lowland Scotch, and the Dialectal Divisions of the Lowland Tongue; and a Linguistical Map of Scotland*, by James A. H. Murray, London, 1873.

[3] *A Glossary (with some pieces of Verse) of the Old Dialect of the English Colony of Forth and Bargy*, collected by Jacob Poole, edited by W. Barnes, B. D., London, 1867.

Chronological Chart of the English Language.



The three vertical lines represent the three leading forms of English, *Northern*, *Midland*, and *Southern*, and the names occurring down the course of each are those of writers and works in that form of English at the given date. The thickness of the line shows the comparative literary position of this form of speech at the time, *thick* indicating a *literary language*, *medium* a *literary dialect*, *thin* a *popular dialect* or *patois*; a *dotted* line shows that this period is *unrepresented* by specimens. The horizontal lines divide the periods; these (after the first two) refer mainly to the Midland English; in inflexional decay the Northern English was at least a century in advance of the Midland, and the Southern nearly as much behind it.

The accompanying table (page 359) will graphically represent the chronological and dialectal development of English.[1] Various names have been proposed for the different stages; it seems only necessary to add to those in the table the descriptive names of Dr. Abbott, who has proposed (*How to Parse*, p. 298) to call the Old English, or Anglo-Saxon, the "Synthetical or Inflexional Period:" the Old English Transition (Late Anglo-Saxon of Mr. Skeat), the "Period of Confusion;" the Early Middle English, "Analytical Period" (1250–1350); the Late Middle English, "National Period" (1350–1500); the Tudor English, "Period of License;" and the Modern English, "Period of Settlement."

As the study of English has made immense advances within the last twelve years, it is only in works recently published that the student will find the subject satisfactorily handled. Among those treating of the whole subject or parts of it may be mentioned—*A History of English Rhythms*, by Edwin Guest, London, 1838; the *Philological Essays* of Richard Garnett [1835-1848], edited by his son, London, 1859; *The English Language*, by R. G. Latham, 5th ed., London, 1862; *Origin and History of the English Language*, by G. P. Marsh, London, 1862; *Lectures on the English Language*, by the same, New York and London, 1863; *Historische Grammatik der englischen Sprache*, by C. F. Koch, Weimar, 1863, etc.; *Englische Grammatik*, by Eduard Mätzner, Berlin, 1860–65 (an English translation by C. J. Grece, LL.B., London, 1874); *The Philology of the English Tongue*, by John Earle, M.A., Oxford, 1866; *Comparative Grammar of the Anglo-Saxon Language*, by F. A. March, New York, 1870; *Historical Outlines of English Accidence*, by the Rev. R. Morris, LL.D., London, 1873; *Elementary Lessons in Historical English Grammar*, by the same, London, 1874; *The Sources of Standard English*, by T. L. Kington Oliphant, M.A., London, 1873; *Modern English*, by F. Hall, London, 1873; *A Shakespearian Grammar*, by E. A. Abbott, D.D., London, 1872; *How to Parse*, by the same, London, 1875; *Early English Pronunciation*, etc., by A. J. Ellis, London, 1869–75, and still in progress; *The History of English Sounds*, by Henry Sweet, London, 1874; *King Alfred's Translation of Gregory's Pastoral Care*, by the same, Early Eng. Text Soc., 1871–72; *On Dialects and Prehistoric Forms of English*, by the same, Philolog. Soc., 1877; as well as many separate papers by various authors in the *Transactions of the Philological Society*, and the publications of the Early English Text Society. J. A. H. M.

ENGLISH LITERATURE. 1. *Anglo-Saxon Period*, 596–1066.—The early history of literature in England might lend some countenance to the theory that the development of a nation's literature is, at bottom, but a chapter of its religious history. While the religion of our fathers was in the main a rude awe-struck worship of the forces of nature, literature either had no existence for them, or was in a state not less elementary, consisting of a few songs and oracles, and nothing more. With the advent of the religion of Christ—the only faith which at once recognizes the original dignity of human nature and repairs its fall—came an intellectual as well as a spiritual awakening to the Teutonic nations—for into such the original tribes or clans of the invaders had now grown—that were planted in the old provinces of Roman Britain. Fortified by gospel precept for the present life, and thrilled with the hope of the life to come, the Saxon mind, released from disquietude, felt free to range discursively through such regions of human knowledge as its teachers opened before it, and the Saxon heart was fain to pour out many a rude but vigorous song. Pope Gregory himself, who, according to the old phraseology, sent baptism to the English, is said indeed to have spoken disparagingly of human learning. But the missionaries could not fail to bring with them from Rome the intellectual culture of the countries bordering on the Mediterranean, so far as it had survived the fall of the Western empire and the irruption of the barbarians. The Roman alphabet, paper or parchment, and pen and ink, drove out the Northern runes, the beechen tablet, and the scratching implement. The necessity of the preservation, and at least partial translation, of the Scriptures, the varied exigences of the Catholic ritual, the demand for so much knowledge of astronomy as would enable the clergy to fix beforehand the date of Easter, all favored, or rather compelled, the promotion of learning and education up to a certain point, and led to continual discussion and interchange of ideas. Gratefully and eagerly our forefathers drew in the warm and genial breath which came to them from the intenser life and higher enlightenment of the south. Beda dates his history by the indictions of the Eastern emperors; and while in practice he obeyed his native king descended from Woden, in theory he recognized the larger and more rational sway of the Cæsar enthroned at Constantinople.

On a closer examination, we find that there were two principal centres, during the first two centuries after the conversion, where learning was honored and literature flourished. These centres were Wessex and Northumbria. For although Christianity was first preached in Kent, and the great monastery at Canterbury was long a valuable school of theology and history (witness the liberal praise awarded by Beda to Abbot Albinus in the preface to his *Ecclesiastical History*), yet the limited size of the kingdom, and the ill fortune which befell it in its wars with Mercia and Wessex, seem to have checked its intellectual growth. When we have named the oldest form of the Saxon Chronicle,—that represented by the Parker MS. $\overline{\text{A}}$,—and the not very interesting works of Abbot Ælfric, there is little left in the shape of extant writings, dating before the Conquest, for which we have to thank the men of Kent. But in Wessex and Northumbria alike, the size of the territory, the presence of numerous monasteries, perhaps also the proximity of Celtic peoples or societies endowed with many literary gifts,—the Britons in the case of Wessex, the Culdees of Iona in the case of Northumbria,—co-operated to produce a long period of literary activity, the monuments of which it must now be our endeavor briefly to review and characterize.

The Traveller's Song.

Deor's Complaint.

But before we consider the Anglo-Saxon literature which was founded on Christianity, the question whether any Anglo-Saxon literature exists of date prior to the conversion demands an answer. It was formerly thought that the important poem of *Beowulf* was in the main a pagan work, and must have been produced before the Angles and Saxons quitted their German homes; but closer investigation has shown that it is permeated almost everywhere by Christian ideas, and that it cannot be dated earlier than the first quarter of the 8th century. But two poems remain, presenting problems of great difficulty, many of which have not yet been satisfactorily solved, which so far as appears must have been composed in Germany while our forefathers were still in their German seats. These are *The Traveller's Song* and *Deor's Complaint.* In the first, Widsith, a poet of Myrging race (the Myrgings were a tribe dwelling near the Eider), recounts the nations that he had visited as a travelling gleeman, names the kings who ruled over them, and singles out two or three whose open-handed generosity he had experienced, and to whom he accordingly awards the tribute of a poet's praise. This poem may perhaps be dated from the second half of the 6th century. Though written in or near Anglen, after the migration of most of the Angles to Britain, the language of the poem seems to have been accommodated to the ordinary West-Saxon dialect, for in this respect it differs in no degree from the other poems which stand before and after it in the Exeter Codex. *Deor's Complaint* mentions Weland, the Teutonic demigod corresponding to Vulcan, Theodric, Eormanric, etc.; it is the lament of a bard supplanted by a rival in his lord's favor. In date it is probably not far distant from the *Traveller's Song*.

Aldhelm.

We may now return to the literary development in Wessex. Christianity was introduced into Wessex by Bishop Birinus in 634, and spread over the whole kingdom with marvellous celerity. The bishop's see was fixed at first at Dorchester, near Oxford; thence it was moved to Winchester; before the end of the century it was necessary to carve out another bishopric farther to the west, and the see was fixed at Sherborne. Winchester, Malmesbury, and Glastonbury were great and famous monasteries early in the 8th century. The heroic Winfrid (better known as St. Boniface), trained in a monastery at Exeter, could not rest contented that Wessex should have received the faith, but carried Christianity to the Germans. Great spiritual fervor, ardent zeal, great intellectual activity, seem to have prevailed in every part of the little kingdom. The interesting letters of St. Boniface give us tantalizing glimpses of a busy life, social and monastic, in the west of England, no detailed picture of which it is now possible to reconstruct. The most distinguished known writer was St. Aldhelm, a monk of Malmesbury, and, for a few years before his death in 709, bishop of Sherborne. His extant works in Latin are chiefly in praise of virginity, that form of self-mastery which, difficult as it was for a people teeming with undeveloped power and unexhausted passion, included, he might think, and made possible, every other kind of self-mastery. The Saxon writings of St. Aldhelm are lost, unless we accept a conjecture of Grimm that he was the author of *Andreas*, one of the poems in the Vercelli Codex. Cynewulf, the author of *Crist*, *Elene*, and *Juliana*, though to us unhappily no more than a name, was a poet of no mean powers. Mr. Kemble was disposed to identify him with an abbot of Peterborough who lived in the 11th century: but it is far more probable,—whatever weight we may attach to Grimm's hypothesis that he was a pupil of St. Aldhelm,—that Cynewulf was a West-Saxon writer, and lived in the first half of the 8th century. *Crist* is a poem of nearly 1700 lines, incomplete at the beginning. When first edited by Mr. Thorpe along with the other contents of the Exeter Codex, it was believed to be a string of disconnected poems. Dietrich was the first who pointed out the internal connection of these, and showed that they constituted one organic whole. Cynewulf seems to revel in the task of expressing in his mother tongue the new religious ideas which had come to his race. Beginning from the Annunciation, he expatiates on the various and inestimable benefits which Christ by his incarnation bestowed on men, concluding with a vivid picture of the last great day of account. The key-note of the poem seems to be found in the 15th canto, where the six "leaps," or movements, of Christ are enumerated:—the first, when He became incarnate; the second, when He was born; the third, when He mounted on the cross, and so on. The name "Cynewulf" is given in runes in the 16th canto; it occurs in the same way in the other poems attributed to this writer. *Elene* is the legend of the discovery of the true cross at Jerusalem by the empress Helena, the mother of Constantine; *Juliana* is the story of the martyrdom of the saint so named, under Maximian. *Guthlac*, a free version of the Latin life of St. Guthlac (who died in 714) by Felix, a monk of Croyland, is probably the work of a Mercian writer, whose language was altered by a West-Saxon transcriber into conformity with that of the poems already mentioned. *Andreas*, a poem of more than 1700 lines, ascribed by Grimm, as we have seen, to St. Aldhelm, but at any rate a West-Saxon poem of the 8th century, is founded on an apocryphal Greek narrative of the "Acts of Andrew and Matthew." The first-named apostle, after rescuing the second from confinement in a barbarous land named Mermedonia, and working numerous miracles of an amazing character, converts the entire nation, and departs after committing them to the charge of a pious bishop named Plato.

---

[1] Brought before the Philological Society in January, 1876.

Cynewulf.

Alliteration.

All the poems hitherto named, and indeed the great mass of Anglo-Saxon poetry, are written in that alliterative metre which was the favorite rhythm of the whole Teutonic north, and of which one variety may be seen in the famous poems of the Edda. Each line is in two sections, balanced the one against the other, and containing usually from four to eight syllables and two accents. The general rule of the metre is that the two accented words in the first section, and one of those in the second section, begin upon the *same* letter, if a consonant; but, if the accented words begin with vowels, then upon *different* letters.

Beowulf.

The preponderance of opinion is now in favor of ascribing to *Beowulf*, the most important surviving monument of Anglo-Saxon poetry, a West-Saxon origin, and a date not later than the middle, nor earlier than the first decade, of the 8th century. Yet the difficulty of the problem may be estimated from the facts, that Thorkelin, the first editor, described *Beowulf* as a "Danish poem," that Mr. Kemble, wrongly identifying the Geatas with the Angles, believed it to have been composed in Anglen before the migration, and brought over to Wessex before the end of the 5th century, and that Mr. Thorpe considered it to be merely a translation of a Swedish poem of the 11th century. Notwithstanding this discrepancy, the general view taken above is that of Grein, Müllenhoff, and other eminent scholars, and we are convinced that the further investigation is carried the more firmly will its soundness be established. Founded on a single MS., which, as originally written, was full of errors, and now is much defaced, the text of *Beowulf* can never, unless another MS. should be discovered, be placed on a thoroughly satisfactory footing; much, however, has been done for its improvement by the labors of German and Danish critics. The general drift of the poem is to celebrate the heroic deeds of Beowulf, who, originally of Swedish race, was adopted by the king of Gautland, or Gotland (as the southern portion of Sweden is still called), and brought up with his own sons. Hearing that the Danish king Hrothgar is harassed by the attacks of a man-eating monster called Grendel, he sails to Zealand to his aid, and after various adventures kills both Grendel and his mother. After this Beowulf is chosen king of Gotland, and reigns many years in great prosperity, till in his old age, undertaking to fight with a fiery dragon that has been making great ravages among his subjects, he succeeds in killing it, but receives a mortal injury in the struggle. The burning of his body and the erection of a huge mound or cairn over his ashes, as a beacon "easy to be seen far off by seafaring men," conclude the poem, and form a passage of remarkable beauty.

The Danes.

Towards the end of the 8th century the descents of the piratical heathens known by the general name of Danes, but probably born for the most part in Scandinavian countries lying to the north of Denmark, began to plague the English coasts. These destroying savages resembled the modern Turks in possessing fine military qualities, and above all indomitable courage; they were also like the Turks in this respect that, wherever they set their foot, progress of every kind was arrested, culture was blasted, and the hopes of civilization died away. Fortunately they were not, like the Turks, absolutely deaf to the voice of the Christian missionary, though their natural brutishness made them difficult to convert and prone to relapse. With incredible pains, and a charity that nothing could disgust or deter, the church gradually won over these Scandinavian Calibans to the Christian creed; and when once converted their immense natural energy and tenacity were turned into right and beneficial channels, at least in great measure. But for 230 years,—from the sack of Lindisfarne to the accession of Canute,—the so-called Danes were the curse of England, destroying monasteries and the schools maintained by them, burning churches and private houses, making life and property everywhere insecure, and depriving the land of that tranquillity without which literature and art are impossible. After a long prevalence of this state of things, society in Wessex having been, one would think, almost reduced to its first elements, Alfred arose, and after obtaining some successes in battle over the Danes, leading to a treaty and the conversion of part of them to Christianity, obtained a period of peace for his harassed and dejected countrymen. History tells us how well he wrought to build up in every way the fallen edifice of West-Saxon society. Among his labors not the least meritorious was his translation of Beda's *Historia Ecclesiastica*, Pope Gregory's work *De Cura Pastorali*, the famous treatise of Boethius *De Consolatione*, and the *Universal History* of Orosius. He also founded several schools, and made a beginning in the work of restoring monasteries. Yet in spite of his generous efforts, the evils caused by the Danes could not be repaired. A sort of blight seemed to have passed over the Anglo-Saxon genius; the claims of material existence suddenly seemed to engross their thoughts, perhaps because their sufferings had taught them that, however it may be with individuals, for nations all higher developments must have a basis of material prosperity to rest upon. Now and then a great man appeared, endowed with a reparative force, and with a courage which aimed at raising the fallen spirit of the people, and turning them back again into the old paths of nobleness. Such a man was St. Dunstan, who fought with a giant's strength against corruption, sloth, and ignorance, and was ever faithful to the interests of learning. There is in the Bodleian Library a little volume, probably written in his own hand; it is a sort of commonplace book; the frontispiece is a drawing of the saint prostrated at the feet of the throned Christ, executed by Dunstan himself; among the contents of the volume are—a grammatical treatise by Eutychius, with extremely curious Welsh glosses, part of Ovid *De Arte Amandi* with similar glosses, and lessons, in Latin *and Greek*, taken from the Pentateuch and the prophets. But his work was undone during the disastrous reign of Ethelred II., at the end of which the Danish power established itself in England. Under Edward the Confessor, French influences began to be greatly felt. The two races of the Teutonic north had

Alfred.

St. Dunstan.

torn each other to pieces, and the culture which Saxon had been able to impart to Northman was not sufficient to discipline him into a truly civilized man. England, though at a terrible cost, had to be knit on to the state-system of Southern Europe; her anarchy must give place to centralization; her schools, and her art, and her architecture be remodelled by Italians and Frenchmen; her poets turn their eyes, not towards Iceland, but toward Normandy or Provence.

Adamnan.

Cædmon.

Turning now to the other literary centre, the Northumbrian kingdom, we find that impulse and initiation were due to more than one source. In the main, the conversion of the Angles north of the Tees, and the implantation among them of the germs of culture, are traceable to Iona, and, indirectly, to the Irish Church and St. Patrick. From Ireland, in the persons of St. Columba and his followers, was wafted to the long low island surrounded by the mountains of the Hebrides, a ministry of light and civilization, which from the 6th to the 11th century diffused its blessings over northern Europe. Oswald, son of the Bernician king Ethelfrid, was driven out of Northumbria after his father's death by Edwin of Deira, and took refuge among the northern Picts. He embraced Christianity through the teaching of the monks of Iona or some monastery dependent on it; and when he became king of Bernicia in 634, one of his first thoughts was to send to his old teachers, and ask that missionaries might be sent to instruct his people. Aidan accordingly came from Iona and founded a bishop's see at Lindisfarne, or Holy Isle. Hence issued the founders of the monasteries of Hexham, Coldingham, Whitby, and many other places. The actual representatives of the monks of Iona returned after some years to their own country, because they would not give way in the dispute concerning Easter; but the civilizing effects of their mission did not pass away. The school of piety and learning which produced an Aidan, an Adamnan, and a Cuthbert deserved well not of England only but of humanity. Adamnan, abbot of Iona about the year 690, has a peculiar interest for us, because a long extract from his work on the holy places is incorporated by Beda in his *Ecclesiastical History*. He also wrote a life of his founder, St. Columba, printed by Canisius and in the *Florilegium Insulæ Sanctorum*. To the encouragement of Bishop Aidan we owe it that Hilda, a lady of the royal house of Deira, established monasteries at Hartlepool and Streoneshalch (afterwards Whitby); and it was by the monks of Streoneshalch that the seed was sown, which, falling upon a good heart and a capacious brain, bore fruit in the poetry of Cædmon, the earliest English poet. We need not repeat the well-known story of the vision, in which the destined bard, then a humble menial employed about the stables and boat-service of the monastery, believed that an injunction of more than mortal authority was laid upon him to "sing of the beginning of creation." The impulse having been once communicated, Cædmon, as Beda informs us, continued for a long time to clothe in his native measures the principal religious facts recorded in the Pentateuch and in the New Testament. Is the work commonly known as Cædmon's *Paraphrase* identical with the work described by Beda? Have we in this paraphrase a genuine utterance of the 7th century? The answers to these questions are still involved in doubt, and to enter upon the discussion which they presuppose would be foreign to our present purpose. We will merely say that the unique MS. of the *Paraphrase*, which is of the 10th century, contains no indication whatever of authorship, and that it opens in a manner different from the prologue made by the real Cædmon, of which we have a Latin version in Beda and an Anglo-Saxon version in Alfred's translation of Beda. On the other hand, the portion of the MS. which is written in the first hand agrees tolerably well in its contents with the real work of Cædmon, as Beda describes it. The portion of the MS. which is written in the second hand is probably of much later date; some critics have not hesitated to designate its author as the "pseudo-Cædmon." The opening cantos of the *Paraphrase*, which treat of the rebellion of the angels and the fall of man, are allowed by general consent to be those most vividly expressed, and most characterized by poetical power. It is here that bright strong phrases occur, which, as is believed, Milton himself did not disdain to utilize, and his known acquaintance with Francis Junius, the then possessor of the Cædmon MS., seems to lend some countenance to the belief.

Beda.

Hitherto the influences in Northumbria tending to culture have been found to be only indirectly Roman; the immediate source of them was Iona. But when we come to the Venerable Beda, the great light of the Northumbrian church, the glory of letters in a rude and turbulent age, nay, even the teacher and the beacon light of all Europe for the period from the 7th to the 10th century, we find that the fountain whence he drew the streams of thought and knowledge came from no derivative source, but was supplied directly from the well-head of Christian culture. Benedict Biscop, a young Northumbria thane, much employed and favored in the court of Oswy, abandoned the world for the church, and travelling to Rome resided there several years, diligently studying the details of ecclesiastical life and training, and the institutes of liturgical order. Returning to England in 668, with Theodore, the new primate, and the abbot Hadrian, he brought into Northumbria a large number of books, relics, and other ecclesiastical objects, and, being warmly welcomed by King Egfrid, founded a monastery in honor of St. Peter on land granted by the king at the mouth of the Wear. That the other great apostolic name venerated at Rome might not go without due honor, he built a second monastery soon afterwards in honor of St. Paul at Jarrow on the Tyne, seven miles from Wearmouth. After the founder's time the two monasteries were usually governed by one abbot. When only seven years old, Beda, like Orderic in a later age, was brought by his father to Jarrow, and given up to the abbot to be trained to monastic life. The rest of his life, down to the year 731, was passed in the monastery, as we know from his own statement; in 735 he died. His works, which have several times been edited in a complete form abroad, but never yet in his own country, may be grouped under five heads—1, Educational; 2, Theological; 3, Historical; 4, Poetical; 5, Letters. To the first class belong the treatises *De Orthographia* and *De Arte Metrica*, the first being a short dictionary, giving the correct spelling and the idiomatic use of a considerable number of Latin words, with (in many cases) their Greek equivalents,—the second a prosody, describing the principal classical metres, with examples. *De Natura Rerum* is a cosmogony and cosmography, with numerous diagrams and maps. A number of treatises, of which the most important are *De Ratione Temporum* and *De Ratione Computi*, fall under the same head; their general object being to elucidate all questions connected with the ecclesiastical calendar and the right calculation of Easter. Under the second head, that of theological works, fall his *Expositiones* on St. Mark's and St. Luke's Gospels, on the Acts, and other books of the New Testament, his homilies, forty-nine in number, and a book of Prayers, chiefly made up of verses taken from the Psalms. Under the head of "Historical lives of five abbots of Wearmouth and Jarrow," a life of St. Cuthbert, another of St. Felix, bishop of Nola, and a *Martyrology*, which has several times been printed. The *Ecclesiastical History* opens with a preface, in which, in that tone of calmness and mild dignity which go far to make a perfect prose style, Beda explains in detail the nature and the sources of the evidence on which he has relied in compiling the work. A short introduction then sketches the general history of Britain from the landing of Julius Cæsar to the coming of Augustine, giving special details respecting the martyrdom of St. Alban under Diocletian, and the missionary preaching of St. Germanus of Auxerre in the 5th century. From the landing of Augustine in 596 to the year 731, the progress of Christianity, the successes and the reverses of the church in the arduous work of bringing within her pale the fiercely warring nations of the Heptarchy, are narrated, fully but unsystematically, for each kingdom of the Heptarchy in turn. A short sketch of "Universal History," forming the latter portion of the *De Ratione Temporum*, has been treated by the editors of the *Monumenta Hist. Brit.* as if it were a separate work, and printed, with the title *De Sex Ætatibus Mundi*, in that useful but unwieldy volume. Among the poetical works are a life of St. Cuthbert in Latin hexameters, a number of hymns, most of which are written in the lively iambic metre of which a familiar instance is the hymn beginning "Vexilla regis prodeunt," a poem on Justin Martyr in a trochaic metre, and another in hexameters on the Day of Judgment. This last seems to have been much admired; Simeon of Durham copied it entire into his history. The versification of this remarkable poem has considerable merits; in that respect it is not more than three hundred years behind Claudian. But when we come to the spirit of the poem, and think of the moral atmosphere which it implies, and aims at extending, we see that ten thousand years would not adequately measure the chasm which divides the monastic poets from the last "vates" of heathen Rome. For the key-note of Beda's poem is the sense of sin; whatever is expressed by the words compunction, penance, expiation, heart-crushing sorrow for having offended God, trust in the one Redeemer, pervades all his lines; and we need not say how alien is all this to the spirit of the poets who, with little thought of individual and personal reformation, staked their all in the future upon the greatness and stability of Rome. "Tu regere imperio populos, Romane, memento." The letters, most of which are merely the dedications and addresses prefixed to some of his works, refer little to contemporary events; two or three, however, are of great interest.

Alcuin.

At the time when Beda died (735), the Angles of Northumbria were beginning to lay aside the use of arms, and zealously to frequent the monastery schools; among their princes, as among those of Wessex, some were found to exchange a crown for a cowl and a throne for a cell. But a reaction set in; perhaps some had tried asceticism who had no vocation for it; and after the middle of the century Northumbrian history is darkened by the frequent record of dissension among the members of the royal house, civil war, and assassination. On this state of things came the ravages of the Northmen, and made it incurable. Lindisfarne, with all its treasures and collections, was destroyed by them in 793. This is but a sample of the havoc wrought by those barbarians; yet for a long time many monasteries escaped; and, in particular, that of York was a centre of learning far on into the 9th century, probably till the disastrous battle occurred before York, described in the Saxon Chronicle under 867. At this monastery Alcuin was educated, and when grown up he had charge of its school and library. In 780 he was sent on a mission to Rome; on his return, at Parma, he fell in with the Emperor Charlemagne, who invited him to settle at Aix-la-Chapelle, at that time the chief imperial residence, to teach his children, and aid in the organization of education throughout his dominions. Having obtained the permission of his superiors at York, Alcuin complied with the request; and from that time to his death, in 804, resided, with little intermission, either at the imperial court or at Tours. Alcuin's letters, though the good man was of a somewhat dry and pedantic turn, contain much matter of interest. His extant works are of considerable bulk; they are chiefly educational and theological treatises, which for lack of vigor or originality of treatment have fallen into complete oblivion. What is still of value in the works of Alcuin is, besides the letters, the lives of St. Willibrord, the English apostle of Friesland, St. Vedast, and St. Richer.

Ælfric.

Saxon Chronicle.

After the death of Alcuin, the confusion in Northumbria became ever worse and worse, for the Danes forced their way into the land, and many years passed before the two nations could agree to live on friendly terms together side by side. But for the *Durham Gospels*, a version in the Angle dialect of the four gospels, and a few similar remains, the north of England presents a dead blank to the historian of literature from Alcuin to Simeon of Durham, a period of more than three hundred years. In the south, as we have seen, the resistance to the intrusion of the barbarian element was more successful, and the intellectual atmosphere far less dark. The works of Ælfric, who died archbishop of Canterbury in 1006, are the last subject of consideration in the present section. They are chiefly interesting because they show the growing importance of the native language. Ælfric's *Homilies* are in Anglo-Saxon; his *Colloquy* is a conversation on common things, in Latin and Anglo-Saxon, between a master and his scholar; his *Grammar*, adapted from Priscian and Donatus, has for its object to teach Latin to Anglo-Saxons; its editorial and didactic part is therefore in Anglo-Saxon. The annals of public events, to which, as collected and arranged by Archbishop Plegmund at the end of the 9th century, we give the name of the *Saxon Chronicle*, continued to be recorded at Canterbury in the native language till about the date of the Conquest; after that time the task passed into the hands of the monks of Peterborough, and was carried on by them for near a hundred years. A work of collecting and transcribing the remains of the national poetry began, of which the priceless volume known as the *Exeter Codex*, given by bishop Leofric to the library of Exeter cathedral in the reign of Edward the Confessor, is the monument and the fruit. The collection contained in the manuscript discovered about fifty years ago at Vercelli was probably made about the same time. In these two collections are contained the works of Cynewulf, the *Traveller's Song*, *Guthlac*, *Andreas*, the poem on the *Phœnix*, etc. Being thus made more widely known, the ancient poems would soon have found imitators, and a fresh development of Anglo-Saxon poetry would have been the result. Had there been no violent change, England would by slow degrees have got through with the task of assimilating and taming the Northmen; and, in spite of physical isolation, would have participated, though probably lagging far behind the rest, in the general intellectual advance of the nations of Europe. The tissue of her civilization would have been, in preponderating measure, Teutonic, like that of Germany; but it would have lacked the golden thread of the "Holy Roman Empire," which brought an element of idealism and beauty into the plain texture of German life. For good or for evil, the process of national and also of intellectual development was to be altered and quickened by the arrival of a knightly race of conquerors from across the channel.

Exeter Codex.

Vercelli Codex.

II. *Anglo-Norman Period*, 1066–1215.—The 11th century is remarkably barren in great names and memories which captivate the imagination; it was, however, an advance upon the 10th, which Baronius has described as the central and worst period of intellectual darkness. In England, for about 150 years after the Conquest, there was no unity of intellectual life; in political life, however, the iron hand of the Conqueror compelled an external uniformity, by the universal exaction of homage to himself. The strength of the Norman monarchy, the absence of religious differences, and, after a time, the loss of Normandy, were causes working powerfully in aid of the conciliation and interfusion of the different elements of the population. But at first it was as if three separate nations were encamped confusedly on British soil,—the Normans, the English, and the Welsh. The clergy, as a fourth power, of all nationalities or of none, became,—by its use of Latin as a common tongue, by preaching a common faith and teaching a common philosophy, and as representing the equality and charity which are among the essential features of Christianity,—an ever-present mediating influence tending to break down the partitions between the camps. The intellectual state and progress of each nation, down to and a little beyond the end of the 12th century, must now be briefly discussed.

Turold.

Guichard.

1. *Normans.*—In less than two centuries after the Northmen under Rollo had settled in Normandy, they had not only exchanged their Teutonic speech for the language of France, but made,—with French as the medium of expression,—remarkable literary progress. In this progress the Normans settled in England participated to the full. It is probable that the Turoldus, who, availing himself of earlier Frankish lays and chronicles, composed towards the end of the 11th century the noble heroic poem called the *Chanson de Roland*, was an abbot of Peterborough, son of the clerk of the same name who was the Conqueror's preceptor. From the reign of Henry I., though the names of several writers are known, little of importance has come down to us. The treatise on politeness called *Urbanus* attributed to Henry himself is in all probability the composition of a later age. The works of the hapless satirist, Luc de la Barre, are not extant , and Evrard's translation (1130) of Cato's *Disticha* into French verse is not a noteworthy performance. The reign of Stephen, though confusion and civil war prevailed over a great part of England, witnessed an extraordinary outburst of literary activity. Of the historians who shed a lustre on this reign we shall speak in a different connection; but it was also memorable for its French poets. Guichard of Beaulieu, a cell of St. Alban's (1150), produced a poem in Alexandrines of some merit, on the vices of the age; Geffroy Gaimar (1140) wrote his lively *Estorie des Engles* (a chronicle of the Anglo-Saxon kings); and Benoit de Ste. More, either in this reign or early in that of Henry II., produced a vast poem on the *History of the War of Troy*, which

seems to have been the original exemplar on which the numerous "Troy-books" of later generations were modelled. The family of Benoit was of Norman extraction, but settled in England. Under Henry II., whose ceaseless and enlightened energy stimulated production wherever it was exerted, French poetry took an ever bolder sweep.

Wace.

Robert Wace, a native of Jersey and a clerk of Caen, composed about 1155 his famous *Brut d'Angleterre*, a history of the kings of Britain from Brutus to Cadwallader, founded on the *Historia Britonum* of Geoffrey of Monmouth. Again, when Henry had commissioned Benoit to write a metrical history of the dukes of Normandy, the quick-witted Wace anticipated his slower rival, and produced in 1160 the first part of the *Roman de Rou*, treating of the same subject.

Arthur romance.

Thus far we have considered the Anglo-Norman poets chiefly as chroniclers; we have now to regard them as romance writers. It is true that in their hands history slides into romance, and *vice versâ;* thus the *Brut d'Angleterre* may be regarded as historical in so far as it treats of the series of British kings, mythical as that series itself may be, but as a romance in most of that portion of it which is devoted to the adventures of Arthur. We here enter upon a wide field; the stores of Arthurian, Carlovingian, and general chivalrous romance suggest themselves to the mind; a thousand interesting inquiries present themselves; but the limits traced for us prescribe a treatment little more than *allusive;* that is, French romance can only be described in virtue of the stimulating and suggestive effect which it had on English writers. This effect was produced in a measure by great poems like the *Alexandreis* (1200), by the original French romances on Charlemagne and his peers, and by that on the third crusade and the prowess of King Richard. But the romances relating to Arthur, doubtless on account of the extent to which they really sprang from British soil, were those which most profoundly stirred the English mind. It is not difficult to trace the steps by which the legend grew. Gildas, writing in the 6th century, knows of Arthur's victory at Mount Badon, but does not name him. Nennius, whose date is uncertain, but who should probably be assigned to the 9th century, mentions the same victory as one of several which were gained by the "magnanimous Arthur" over the Saxon invader. Three centuries pass, and the story comes to us again, greatly amplified, in the *British History* of Geoffrey of Monmouth (1126). This history, Geoffrey assures us, was founded upon a book in the Breton language, brought over from Brittany by an archdeacon of Oxford. Ritson scouted the assertion as fictitious, yet it was probably true; and the supposition of a Breton origin for his history is exactly what would best account for the great development which we find the Arthur legend to have now attained, in comparison with the age of Nennius. For Brittany was the fruitful parent of numberless forms of imaginative fiction,—a trait noticed by Chaucer:

> "These olde gentil Bretons in their daies,
> Of divers aventures maden laies:"

Saint Graal.

and what character would the Breton bards be more likely to embellish than that of the hero king, who, during and before the migration of their forefathers, had made such a gallant stand against the Saxon? Yet, though Geoffrey has so much to tell us of Arthur, he is silent about the Round Table. That splendid feature of the legend first appears in the *Brut* of Wace, and was probably derived from Breton poems or traditions to which Geoffrey had not access. Layamon reproduces it, with additional details, in his version of Wace. Other branches of Arthurian romance, especially those relating to Tristan and Perceval, became about this time widely popular; it is to this period also that the *Chevalier du Lion* of Chrétién de Troyes belongs. Suddenly there is a great change. A cycle of romance, which till now had breathed only of revenge, slaughter, race-hatreds, unlawful love, magic, and witchcraft, becomes transformed in a few years into a series of mystical legends, symbolizing and teaching one of the profoundest dogmas of the Catholic creed. This strange effect was produced by the infusion into the Arthur legend of the conception of the *Saint Graal*, the holy vessel used by Christ at the Last Supper, and containing drops of his blood, which Joseph of Arimathea was said to have brought into Britain. This transformation seems to have been executed by Walter Map, the remarkable Welshman whose genius decisively colors the intellectual history of the last forty years of the 12th century. Map is said to have written a Latin history of the Graal, which is not now extant; yet from it all the authors of the French prose romances on Arthur and the Saint Graal which appeared between 1170 and 1230—Robert de Borron, his kinsman Hélie, Luc de Gast, and Map himself—profess to have translated their compositions. The chief of these works are the *Saint Graal, Merlin*, the *Quest of the Saint Graal, Lancelot, Tristan* and *Mort Artur*. In all, to "achieve the Saint Graal," that is, to find or see the holy vessel which, on account of the sins of men, had long since vanished from Britain, is represented as the height of chivalrous ambition; but among all Arthur's knights, only Sir Galahad, the son of Lancelot, is sufficiently pure in heart to be favored with the sublime vision. English versions, more or less literal, of these romances, among which may be named the works of Lonelich and Sir Thomas Malory, and the alliterative poem of *Joseph of Arimathie*, attest the great and enduring popularity of the Graal form of Arthurian legend.

Welsh poetry.

2. After a long period of silence, the bardic poetry of Wales broke out, just when the independence of the nation was about to be extinguished, into passionate and varied utterance. The princes who struggled successfully against the attacks of Henry II. found gifted bards—Gwalchmai, Elidir, Gwion, etc.—to celebrate in fiercely patriotic strains their imperfect triumphs. A translation of one of Gwalchmai's odes may be found, under the title of the *Triumph of Owen*, among Gray's poems. Supposed "Prophecies of Merlin," a sample of which may be seen in the strange work of Geoffrey of Monmouth, fed the popular belief that Arthur yet lived, and would return one day to Wales as a deliverer. Both the *Triads* and the *Mabinogion* refer in part to Arthur, but from different stand-points. In the *Triads* such mention as there is of him represents him as a British king, doing battle with the foes of his race, and full of a sententious wit and wisdom. In the *Mabinogion* the indigenous Welsh view is overpowered by that of the Norman trouvères; we have the Arthur, not of history or tradition, but of chivalry; the mysterious Saint Graal proves as attractive to the Celtic as to the Teutonic imagination. Three of the romances by Chrétien de Troyes appear in a Welsh dress among the tales of the *Mabinogion*. After the loss of independence under Edward I., the importance and originality of Welsh literature appear to have progressively declined.

3. The English-speaking portion—that is, the great mass—of the population, down to the reign of John, has left few literary traces of its existence. Whoever wished to move amongst the educated and cultured classes, and to associate with persons of rank, authority, or influence, found it necessary, though he might be descended from Alfred himself, to speak French in good society, and to write in French whatever he wished good society to read. From the Conquest to 1200, the industry of the most lynx-eyed antiquary has discovered—with the exception of the continuation of the Saxon Chronicle—no literary record in English beyond a few short fragments, such as the lines preserved as a part of Canute's song by Thomas of Ely, the prophecy of Here, and the hymn of St. Godric. The continuation beyond the Conquest of the Saxon Chronicle was made by the monks of Peterborough. It is not complete for the reign of Stephen, passing over several years *sub silentio;* but it records the accession of Henry II. in 1154, and then ends abruptly. The writer or writers were perhaps unable to stand up any longer against the then universal fashion of employing Latin for any serious prose work. Moreover, as the Anglo-Saxon was no longer taught in schools nor spoken in the higher circles of society, it had lost much of its original harmony and precision of structure; and "when the annalist found himself using one inflexion for another, or dropping inflexions altogether, he may well have thought it high time to exchange a tongue which seemed to be crumbling and breaking up, for one whose forms were fixed and its grammar rational. Little did the down-hearted monk anticipate the future glories which, after a crisis of transformation and fusion, would surround his rude ancestral tongue."[1]

A few years after the beginning of the 13th century we have to note the appearance of an important and interest-

---

[1] Arnold's *Manual of English Literature.*

Layamon.

ing work in English,—Layamon's *Brut*. But it can scarcely be said to belong to English literature, unless *Beowulf* and *Judith* be similarly classified, for the language is almost as purely Teutonic as in these. In the older version of the *Brut* not more than fifty words of Latin or French origin have been found; and of these several were in common use in England before the Conquest. The *Brut* is strictly a monument of the age of transition. We need not, with some writers, call the language "semi-Saxon;" it is certainly English, and, from a particular point of view, purer English than we speak now; but it is not that form of English which, from first to last, has been the instrument employed to build up English literature. That form, as we shall see in the next section, was determined and conditioned by the necessity of effecting a compromise between the speech of the governors and that of the governed, so that the new standard English should remain, as to its grammatical framework, comparatively intact, while admitting to its franchise, and enrolling among its vocables, an indefinite number of foreign recruits.

The work of Layamon is a translation, but with very considerable additions, of Wace's *Brut d'Angleterre*. The most interesting of these additions (the sources of which have not been as yet pointed out) constitute an expansion of the legendary history of Arthur. Layamon was the parish priest of Ernley-on-Severn (now Areley Regis), a remote Worcestershire village, far from the capital or any large city. At such a place Norman influence would be at a minimum; the people would go on from one generation to another, living and speaking much as their fathers did before them; and we may suppose that, finding some indications of literary taste and poetic feeling among members of his flock, the good Layamon took this way of gratifying them. But it must be carefully observed that in the *Brut*, although the language is English, the poetical atmosphere, the intellectual horizon, and even the cast of diction, are Norman-French. The rich poetic vocabulary of the Anglo-Saxon poets, traceable as late as the reign of Edgar, has vanished beyond recovery. Not one of the innumerable poetic compounds relating to battle and victory which are found in *Beowulf*, *Andreas*, etc., occurs in the duller pages of the *Brut*. Words expressive of jurisdiction and government, of which the Anglo-Saxon, while the native race was dominant, had a great variety, are in the *Brut*, if used at all, borrowed to a large extent from French.

History and Philosophy.

The labors of the clergy and monks during all this period were applied with unwearying diligence and signal success to the building up of a Latin literature. In the list of chroniclers occur the well-known names of Florence of Worcester, William of Malmesbury, and Henry of Huntingdon. Many histories of particular monasteries were written, and have recently to a large extent been made accessible, through the labors of editors employed under the superintendence of the Master of the Rolls. St. Anselm, archbishop of Canterbury in the reigns of William II. and Henry I., employed his great metaphysical and dialectical powers in the endeavor to establish a harmony between reason and faith. The scholastic philosophy, technically speaking, began with Peter Lombard and his *Book of Sentences* (1151): from the university of Paris it spread all over Europe; and in the next period it will be seen that several of the most eminent schoolmen were natives of the British Isles. The works of our countryman, John of Salisbury, who studied and resided much at Paris about the middle of the century, throw a curious light on the tenets and mutual relations of the scholastic sects.

III. *Amalgamation of Races.—Commencements of English Literature*, 1215–1350.—The course of events in this period, as bearing upon literature, may be thus described. The fortunate loss of Normandy in 1204 brought the ruling classes and the commonalty of England closer together, put an end to the transmarine nationality and domicile of the former, and gave a common political interest, in relation to the outside world, to all the dwellers on English soil. Thus two out of the four nations, which we spoke of in the last section as encamped side by side on British territory, were soon in a fair way of being fused into one. The third—the Welsh—losing in 1292 its political independence, lost also with it the pretension, and almost the desire, to maintain a separate literature. Still, however, in spite of common interests, and the ever-growing multiplicity of the ties of blood between the two, Norman and Englishman continued each to speak his own language. Layamon, about 1205, and Ormin, fifteen or twenty years later, write for the English-speaking majority which understands little or no French; from French their language is just as alien as the Flemish of the present day. The first great step towards that blending of tongues which was to crown the blending of families already commenced was taken when the English writers and translators of the 13th century (the terms are almost synonymous), began to admit freely into their writings an unlimited number of those generally intelligible French words of which the stock was, through closer intercourse between the governors and the governed, perpetually on the increase. Of this practice Robert of Gloucester and Robert Manning are conspicuous examples. In spite of this approximation, we shall find that strenuous efforts were made, by or on behalf of the upper classes, to retain French as the common literary language, and keep English in the position of a popular dialect, useful for the common purposes of life, but not vivified by genius or polished by contact with refined lips. Of this effort Robert de Grosseteste, bishop of Lincoln, may be considered the centre. It broke down, however, against the force of circumstances. First, as fast as good French books were produced, Englishmen translated them, and the translations probably found ten readers for one who could enjoy the originals; secondly, the wars between England and France which broke out in 1338, and in which the English-speaking archers—the back-bone of the stout yeomanry, now, alas! no more, which then covered the land—won the chief share of glory, must have greatly tended to discredit among Englishmen of all classes the tongue of their enemies. Trevisa says that the popular rage for speaking French which had existed before the "grete deth" (the plague of 1348), was since then "somdele chaunged." Though he naturally refers to a date still fresh in every one's memory, the change could have had nothing to do with the plague; it was probably, as conjectured above, the effect of the French war. By the middle of the 14th century the industry of the translators had produced a great body of English compositions, colored everywhere by French thought, and studded with French words; the preaching of the friars had for a hundred years been working in the same direction, *i.e.*, to break down the partition not only between the races but between the tongues; the war suddenly gave to English an enormous advantage over its rival in respect of popularity; it need not therefore surprise us to find, as we shall find in the next period, a great native writer choosing English for the instrument of his thought, and founding English literature upon an imperishable basis.

French and English.

In the last section we saw that Latin, the language of the clerical community, was holding its ground vigorously and successfully against the different forms of vernacular speech current in England. While these last remained in a rude and unsettled condition, it was inevitable that Latin should enjoy the superiority. But the French language was ever growing in importance; its grammatical forms were by this time tolerably settled, and its modes of derivation fixed; it was a spoken tongue, and the Latin was not. Hence, about the date of Magna Charta (1215), French begins to appear in our public instruments, Latin having been the documentary language since the Conquest; about 1270 it begins to supersede Latin as the language of private correspondence. Latin thenceforward was less and less used as the language of poetry, the vehicle of satire, or the voice of piety; French took its place. The theologian, the philosopher, and the annalist alone remained faithful to Latin, the third more out of habit perhaps, and because he had inherited the great works of the past, the histories of Beda, Florence, etc., than because his work could not have been competently performed in French. To this period belong the important chronicle of Matthew Paris, who died in 1259, that of Nicholas Trivet, and the *Polychronicon* (or at any rate the earlier portion of it) of Ranulf Higden. Great developments of the scholastic theology were made in this period, chiefly by the new orders of friars founded about its commencement, the children of St. Francis and St. Dominic. Two of the most celebrated of the Franciscan writers, Duns Scotus and William of Occam, were natives

Matthew Paris.

of the British isles; they were respectively the chiefs of the realists and nominalists, the parties representing among the school-men Platonic and Aristotelian theories. Robert Holcot, a distinguished Dominican writer and a nominalist, was carried off by the plague of 1348.

Roger Bacon.

Philosophy now for the first time, in the person of Roger Bacon, devotes herself systematically to the study of nature and its laws. This great man, the chief part of whose long life was spent in the Franciscan friary at Oxford, died in 1292. The main plan of his principal work, the *Opus Majus*, was—in the words of Dr. Whewell—"to urge the necessity of a reform in the mode of philosophizing, to set forth the reasons why knowledge had not made a greater progress, to draw back attention to sources of knowledge which had been unwisely neglected, to discover other sources which were yet wholly unknown, and to animate men to the undertaking by a prospect of the vast advantages which it offered." But the subsidiary aids which physical science requires were wanting to him, and in that rude age could only be obtained with extreme difficulty. Mathematical instruments were terribly expensive; tables were scarcely to be had; books were both rare and costly. That he discovered so much as he did—chiefly in chemistry and optics—is a thing to wonder at. Vague reports of these discoveries circulating among the ignorant populace caused Roger Bacon to be deemed a conjuror or necromancer; the chap-books and low comedies of the reign of Elizabeth represent him exclusively in this light.

Grosseteste.

In the reign of Henry III. a strong effort was made to make French the exclusive literary language of the English people. It was a struggle between the tongue of the upper class and the tongue of the middle class. Robert Grosseteste, the admired and venerated bishop of a great see, was surrounded by ecclesiastics of rank, and in constant intercourse with earls and barons. All such persons would speak French; those that were laymen would stand in great need of spiritual and moral instruction, and this could not well be conveyed to them in any language but their own; it was quite natural, therefore, that the bishop should encourage the writing of French treatises; and it is probable that he sincerely thought the English tongue not to be worth cultivating for the purposes of literature. He may be excused for holding this opinion, if the only specimens of it which he had seen on paper were such as the *Ormulum*, or even as Layamon's *Brut*. A French work, the *Manuel des Péchés*, treating of the decalogue and the seven deadly sins, which are illustrated with many legendary stories, was formerly ascribed to Grosseteste—it is now known to have been the work of William of Waddington; yet if the statement be true, that it is a version of a little known Latin treatise, there remains a probability that the bishop, in pursuance of a general plan of action, encouraged Waddington to make his version. To the *Chastel d'Amour*, a work of devotion dwelling on the mode of the miraculous incarnation of the Redeemer, Grosseteste's claim seems to be better founded: if he did not write it, he certainly caused it to be written. The same despair of making anything of English, or the same connection with a circle of readers in the upper ranks of society, led Peter Langtoft, a canon of Bridlington, in spite of his unmistakably English name, to write in French a rhyming chronicle of English history, which he brings down to 1307. Other cases might be mentioned; in fact, as Warton says, "anonymous French pieces both in prose and verse, and written about this time, are innumerable in our manuscript repositories." There were French originals of *Guy of Warwick*, *Bevis of Hamtoun*, and many other romances, although few of them are now extant.

Ormin.

Robert of Gloucester.

Havelok.

But if the attack was vigorous, the defence was sturdy and persistent, with a tenacity which spoke of final victory. Ormin's rhythmic gospels (supposed to have been written about 1225), though the orthography proceeds upon a theory, and is so far interesting, presents, it must be admitted—owing to the strangeness of the spelling, the want of rhyme, and the paucity of words of Latin origin—a barbarous, almost repulsive, aspect to the reader. The war of the barons in Henry III.'s reign, in which the cause of Leicester and other French-speaking aristocrats was taken up by the mass of the people with unmeasured enthusiasm, certainly had the effect of introducing a number of French words into the popular speech. This may be gathered from the remarkable English ballad on the battle of Lewes (1264), written by a partisan of Leicester, the phraseology of which is marked by almost the same proportion of words of French origin as prevails in modern English. Moreover, the movement of the verse is vigorous and free, and such as befits a language that is fast rising into importance, and has a great destiny before it. In the reign of Edward I. appeared the English rhyming chronicle of Robert of Gloucester. The early portion of it is founded on Wace's *Brut*, but the author continues the history down to 1272, the date of Edward's accession. Robert is a plodding, dull writer, but his work proves that he knew of a considerable class of persons who knew no French, yet were capable of deriving pleasure from literature; it is for this class that his somewhat ponderous poem was intended. The pretty poem describing a contest between an owl and a nightingale (date about 1270) is in the dialect of the south of England. It is no translation, but seems to have been suggested by passages in the *Roman de la Rose*. Many English romances, *e.g.*, *Havelok*, *King Horn*, *King Alexander*, *Richard I.*, *Guy of Warwick*, etc., date from the reign of Edward I., or, say, from the last twenty years of the 13th century. Most of these are translations from the French; in the case of *Havelok*, however, this remains to be proved, no French version (other than the sketch, much earlier in date, given in Gaimar's *Estorie*) being now extant. There is a French version of *King Horn*, but it differs greatly from the English romance, and there is good reason for believing that the English poem is the earlier of the two. Both *Havelok* and *King Horn* are founded on Anglo-Danish traditions current in the east of England; on this account, and in consideration of the long intellectual blight which the Danish inroads produced in those parts of the country, they are extremely interesting and valuable. They abound in French words, and on reading them we feel that a language which has become so fluent, flexible, and accommodating cannot but make its way and attain to predominance.

Manning.

Perhaps the works of no single writer contributed so much to this result as those of Robert Manning, or, as he is also called, Robert of Brunne. Robert was a monk of the order founded by St. Gilbert of Sempringham; his monastery was in South Lincolnshire. He belongs to the reigns of Edward II. and Edward III.; the date of his death is unknown; but it was probably about 1340. He executed a new version of Wace's *Brut* in octosyllabic rhyming verse, and added to it a translation of the French rhyming chronicle of Peter Langtoft, mentioned in a previous paragraph. He also translated Waddington's *Manuel des Péchés*, adding many characteristic and lively passages which make his version much more entertaining than the original work. To all these labors the good monk was impelled, not by the love of fame, which would have been more easily gratified if he had written in French, but by the benevolent desire to give his lay friends and acquaintances something pleasant to read and talk about—

> "For to haf solace and gamen,
> In felauschip when tha sit samen [together]."

We have found that by degrees men of better, or at least equal, mark have taken to writing in English, as compared with those who preferred French; for instance, Robert Manning is at least equal as a versifier to Peter Langtoft. In the next section will be described the rise of Chaucer, Langland, and Gower, and the final victory of the native speech.

Wickliffe.

IV. *Early English Literature*, 1350–1477.—The period at which we have arrived comprises about 120 years, ending at the date of the introduction of printing into England. During all this time the scholastic philosophy reigned undisturbed at the universities. Wickliffe, so far as his methods of argument and reliance on logic were concerned, was as much a schoolman as the friars who contended with him. The time was not yet come when a churchman would be found, like Colet, to decry the scholastic methods, and rely on literature rather than on logic. Wickliffe's first attacks upon the established order were directed, not against doctrine, but against the encroachments of the church upon the state, against the holding of temporal "lordship" or authority by ecclesiastical persons, and against the claim asserted by the Pope to receive "Peter's pence," or an equivalent, from the English nation. These views he was said to have borrowed from Marsilius of Padua and John of Gaudun; but in truth such Ghibeline sentiments were so common in France and Germany, as well as Italy, that it is needless, in Wickliffe's case, to attempt to trace them to particular authors. Afterwards he broached some singular opinions on several abstruse points of metaphysics, which led to "determinations" or treatises being published against him by John Kyningham, a Carmelite, and John Tyssington, a Franciscan. Lately, he aroused a theological storm, about 1380, by reviving something like the condemned heresy of Berengarius on the mode of the presence of Christ in the sacrament. Replies were written by Wynterton, Wells, Berton, and others. A synod met in London and condemned Wickliffe's doctrine; he died at Lutterworth soon afterwards. The whole complex controversy which he had stirred up was taken in hand, some years later, by a man of vast ability and learning, Thomas Walden the Carmelite, one of the English theologians who took part in the council of Constance. Walden's *Doctrinale Fidei* has been more than once printed on the Continent.

All the writings hitherto described were in Latin. But Wickliffe, on the principle "Flectere si nequeo superos, Acheronta movebo," resolved to carry the conflict into a more spacious arena, and to appeal to popular sympathy by writing in the language of the people. He preached and circulated many English sermons; he organized his "pore priestes" as a body of itinerant preachers; assisted by his followers he put into circulation an incredible number of English tracts, directed against abuses in discipline, and what he deemed errors in doctrine. Lastly, he caused to be made a complete English translation of the Vulgate Bible, and himself, in all probability, took a considerable share in the work. His efforts, seconded by those of his principal adherents, such as Herford, Repington, Purvey, etc., gave rise to the sect of the Lollards, which must have rapidly grown into importance, since it received marked notice in the poetry (written probably between 1380 and 1390) of both Chaucer and Gower. The famous Act "De heretico comburendo" of 1401, and the rigid inquisitorial measures instituted by Archbishop Arundel, and carried on by Chichely, drove Lollardism beneath the surface of society and from the pages of avowed literature. Yet, though repressed, the spirit of discontent survived. Many Lollards were burnt so late as in the first year of Henry VIII.; and the rain of pamphlets and ballads against the church and the clergy, which burst forth as soon as the king was ascertained to be hostile to them, was a sufficient indication of the pent-up hatred which filled the breasts of thousands.

Pecock.

The career of Pecock, bishop of Chichester, may be regarded as an incident of Lollardism. Feeling sore and uneasy under the attacks which men, many of whom were undeniably earnest and moral, were making on the clergy and their doings, Pecock wrote in English *The Repressor of over-much wytinge* [*blaming*] *of the Clergie*. He thought that the time for appealing to authority was gone by, and that the Lollards could only be reconciled to the church by proving that her precepts and her ritual were in themselves reasonable. In short, he made the reason of the individual the judge of the goodness, or otherwise, of what the church did and commanded. On this ground his brother bishops could not follow him; his books were condemned at a synod held in 1457, and he was deposed from his bishopric.

English literature in the full and proper sense, of which we saw the beginnings in the cumbrous alexandrines of Robert of Gloucester, and the more pleasing and successful writings of Manning, asserts itself in this period as a growth of time, destined to have thenceforward an independent being and a powerful influence. It is interesting to note that two distinct and rival tendencies now make their appearance, which may be described as the Teutonic affinity and the Franco-Latin affinity. The sturdiness and self-reliance of the old Saxon blood led many Englishmen to undervalue the culture of the day, which came from the South, and to look lovingly towards the old Teutonic rock from which they were hewn, in the faith that true light and deliverance were to be found there. Of this tendency Langland is the chief representative in the 14th century. He employs the old rhythm of the Teutonic nations,—alliteration; he rejects French models, and studies not French poets; the homely kindly life of the English lower and lower-middle classes is what he loves to depict; the covetousness and ambition of the foreign ecclesiastics who absorb English prelacies he is never tired of denouncing. The whole body of alliterating poets,—and recent investigation has shown that their number was considerable even down to the 16th century; the last known alliterative piece is by Dunbar,—represent, with Langland, this Teutonic affinity. Chaucer, Gower, Lydgate, and the writers who formed themselves upon them, represent the Franco-Latin affinity. Endowed with a more receptive temper and finer perceptions than the men of the opposite school, Chaucer opened his large heart and capacious intelligence to all forms of excellence within his reach; and a man so minded could not fail to see that what had been written in French and Italian far outweighed what had hitherto been written in English or German. Neither could his more cultivated ear fail to prefer the rhyme of the South to the alliteration of the North. "I am a Southron man," he says under the mask of the Persone—

Alliterative poets.

> "I cannot geste, *rom, ram, ruf*, by my letter;

that is, I cannot write alliterative poems like Langland. Wherever good words were to be had, Chaucer appropriated them, whether their origin were Saxon or Romance; wherever he found a good poem, he imitated it, often bettering the instruction. This veracity of the intellect, this large-mindedness, were the cause that our early literature was laid on broad foundations, and contributed not a little to the many-sided and *sympathetic* character of our language.

Chaucer.

The labors of Tyrwhitt and Warton, and in our own day of Sandras and Ten-Brink, have laid bare the sources whence the genius of Chaucer drew its materials and derived its kindling suggestions. The old notion that his earliest writings show the influence of the Provençal poetry has been abandoned on more accurate inquiry. The *Complaynt of the Dethe of Pite*, which is among the earliest, if not the earliest, of the extant compositions, is saturated with the French spirit. The great work of his early youth was the translation of the *Roman de la Rose* of Lorris and Meung,—a poem, be it remembered, not the growth of Normandy, but of France proper, not the work of trouvères, but of French poets. This transformation and sublimation of the *romance* of the earlier into the *dream* and *allegory* of the later Middle Ages, originated by the genius of Lorris, was eagerly adopted by Chaucer, most of whose pieces, prior to the great work of his life, the *Canterbury Tales*, were cast in the allegorical mould. This is the case with the *Assembly of Foules*, where the gentle "formel eagle" is believed to represent Isabel, daughter of Edward III., betrothed in 1364 to Engelram de Couci, as the formel is in the poem to the "royal tercel." Again the *Boke of the Duchesse*, on the death of Blanche, duchess of Lancaster, in 1369, is, in form, a vision seen in a dream; it is also full of actual borrowings from the French poets Lorris, Meung, and Machault. The mannerism of the French poets is also present in the *Court of Love* and the *House of Fame*, compositions which probably belong to Chaucer's middle life. Even in the *Legende of Goode Women*, a work of his later years, many passages, particularly the beautiful lines rehearsing his annual worship of the daisy, are significant of the degree in which his mind was still imbued with the graceful and fanciful conceptions of the French poets.

But the sunny South produced in that age other poets beside the French, poets the force and melody of whose writings caused the glory of Lorris and Machault to wax pale in comparison. Chaucer must have become acquainted with Boccaccio at an early age, for in the *Assembly of Foules*, written when he was only twenty-four or twenty-five, several stanzas are translated from the description, in the *Theseide* of the Italian poet, of the garden of Queen Nature. With Petrarch he is believed, on reasonable grounds, to have become acquainted during his visit to Italy in 1373; the charming allusion to the "laureat poete," in the prologue to the "Clerke's Tale," is familiar to every reader. Dante, whom he calls "the grete poete of Itaille," supplied him with a vision in the "House of Fame," and with the materials of one of the tragedies in the "Monke's Tale," the story of Count Ugolino. But it was to Boccaccio that his obligations were the largest; from his *Filostrato* he translated, though with many additions and alterations, his *Troylus and Cryseyde;* the "Knighte's Tale" is in the main a translation of the *Theseide*, and two or three other *Canterbury Tales* are more or less close renderings of stories in the *Decameron.* Italian was then in a far more advanced stage, one better suited for literary purposes, than English; and it must be set down as undoubtedly due to his Italian studies that in Chaucer's hands our language,—which seventy years before had appeared as a barbarous dialect in the mouth of Robert of Gloucester, and, even as used by Langland, Chaucer's contemporary, is harsh and crabbed,—was proved to be rich in sweetness and harmony, no less than in force.

Canterbury Tales.

After all, had Chaucer done no more than has been already indicated, though he would have deserved credit for polishing and regularizing the language, and would have left models of style for later ages to imitate, he would not have earned the praise of a great and immortal poet. In this category, however, he is definitively placed, in virtue of the original portions of the *Canterbury Tales.* Not only is the Prologue the work of a great literary artist, drawing from nature, with an incomparable force, sureness, and freedom of hand, but the whole series of linking passages, besides many of the tales, which, though the materials are old, are transfigured by the treatment they receive, attest the presence of a masterly intellect and an unfailing imagination. He "saw life thoroughly, and saw it whole;" his somewhat keen and caustic temper opened his eyes to the tricks of hypocrites and pretenders, which his manly straightforwardness made him expose without ceremony; on the other hand, the noble and really superior cast of his character placed him in full sympathy with those who in heroic self-denial were following under his eyes the counsels of perfection. Over against the portraits of Monk, Friar, and Pardoner in the Prologue, may be set the legend of Sainte Cecile, the "Man of Lawe's Tale," and the exquisite opening stanzas of the "Prioress's Tale." In that peculiar combination of great force of handling with grace and versatility, on which the availability and effect of poetic genius so largely depend, Chaucer may be placed in a trio with Shakespeare and Pope, and no fourth name in English literature can, from this point of view, be raised to their level.

Gower.

Coming to speak of Gower after Chaucer, we descend, as we now clearly see, through an enormous interval; but this distance was not so apparent to their contemporaries and immediate successors. "Ancient Gower" was a favorite with Richard II., and was also prudent enough to pay his court betimes to the young Duke of Lancaster, soon to be Henry IV. His *Confessio Amantis* is colored by all the profanity and much of the cynicism which belong to Jean de Meung's portion of the *Roman de la Rose.* It may be observed, in passing, that the *Roman* was the product of a kind of minor renaissance, or revival of ancient learning. The *Somnium Scipionis* of Macrobius gave the dream-form, and Ovid's *Ars Amandi* supplied an abundant store of amatory details. From this last, and from others of his poems, the counsels and warnings to lovers, with which the *Roman*, the *Confessio Amantis*, and many another popular poem of that day was stocked, were, partly by suggestion, partly by direct translation, derived. That the *Ars Amandi* should come to spread so wide an influence was a fact of no good omen to the morals of Europe. Refinement, even when little more than external, seems to exercise an invincible attraction on the human mind. The wit and suppleness of the Greek intellect, the polished luxury of the Roman empire, dazzled more and more the semi-cultivated society of Europe, and created a paganizing fashion, of which the moral results were often deplorable. Numbers even of ecclesiastics were carried away; bishops prided themselves on their elegant *symposia;* abbots, "purple as their wines," thumbed Anacreon instead of their breviaries; and in spite of Savonarola and other reformers from within, no effectual check appeared for these evils till it was supplied by the rude blasts of the Reformation.

Lydgate.

Dan Lydgate, the monk of Bury, was a loyal admirer and follower of Chaucer; and if the practice of poetry could make a perfect poet, he should stand, in virtue of his innumerable compositions, among those of the highest rank. But the language,—already rich and various, but unsettled in form and deficient in precedents,—escaped out of his control; to bend and tame it effectually while in such a condition required the strength of an intellectual giant, such as Chaucer was, but Lydgate certainly was not. We know that Chaucer took the greatest pains with his metre—

"So praye I to God, that none miswrite thee,
Ne the mysmetre for defaut of tonge:"

but Lydgate, though, to recommend his mediocre thoughts, he should have taken much greater pains, took in fact much less. Perhaps some crude theory of poetic inspiration misled him, as it misleads poets of our own day, whose roughness and obscurity yield as unsatisfactory results as Lydgate's roughness and mediocrity. The materials for his more important productions were chiefly French and Latin works of his own day, or not much earlier in date. Thus his *Falls of Princes* is from a French metrical version of Boccaccio's Latin praise work, *De Casibus Illustrium Virorum*, and his Troy-book is founded on the *Historia Trojana* of Guido di Colonna, a Sicilian jurist of the 13th century. Lydgate's admiration for Chaucer was undoubtedly sincere, and he probably attempted to imitate the best points of Chaucer's style. If yet to a great extent he failed, this was perhaps due, not merely to the carelessness to which we have before adverted, but also to the influence of the barbarous writers of alliterative verse, whose activity, at this period, we described in the early part of this section. Alliterative rhythm is accentual, heroic rhythm is syllabic. An alliterative verse may have a varying number of syllables, but must have four accents; an heroic verse may have a varying number of accents, but must contain ten, or at most eleven, syllables. Of course the variation in either case is confined within certain limits, and the rules themselves are not without exceptions; but into these details we have not space to enter. Suffice it to say, that the reason why there is so much halting metre in Lydgate, Hawes, Barclay, Harding, Juliana Berners, and other versifiers of the 15th and 16th centuries, would seem to be that, unlike Chaucer, they indulged in much of the syllabic license of the alliterators, while yet they were not Goths enough to adopt their rhythm altogether. Between the Teutonic and Franco-Latin stools, so to speak, they fell to the ground.

A recent writer, to whose labors the history of English literature is much indebted,[1] desiring to mark picturesquely the appearance of an art which he thought was destined to give the death-blow to mediæval superstition, has said that "in the year of the condemnation of Reginald Pecock for declaring that all truth would bear the test of reason and inquiry, John Fust or Faust and Peter Schœffer printed a magnificent edition of the Psalter." This shows how easily an attractive antithesis may become a trap for the unwary. The statement made in the protasis of the above sentence is untrue, and that in the apodosis irrelevant. Pecock was not condemned for "declaring that all truth would bear the test of reason and inquiry" (which of course his opponents believed as well as he), but for maintaining, along with other novel opinions, that reason was a better guide than authority as to the matter of revealed religion. Doubtless many would agree with him, but this is a very different proposition from the other. Nor again was the appearance of Fust's Psalter an epoch in the history of printing, as the coincidence of dates, to be worth noticing, would require, for it was both preceded and followed by the production of more important works.

Invention of printing.

Yet it would not be easy to overrate the effect produced by the invention of printing on the development of literature, and the diffusion of those complex influences and arrangements which we call civilization. Language and its devices, as Horne Tooke showed in his *Diversions of Purley*, exist but to promote the rapid interchange of ideas between man and man; and the device of printing is a further long step in the same march, and a part of the same endeavor. By means of it, books reached in five years countries which before they had not reached in twenty, and readers were multiplied a hundred fold. Through it the speculations of scholars and the theories of philosophers could be quickly brought before the whole body of learned men and philosophers in Europe; hence arose counter speculations and adverse theories, which again obtained publicity with the same rapidity as the first, and to this process there was no limit. Poetry, as being one of the more spontaneous growths of the human mind,—the child of passion and imagination, not of controversy,—owed comparatively little to the new invention. The literary annals of Spain furnish us with the names of more than a hundred poets who adorned the long reign of John II. of Castile, ere printing came into being; while for a century after the discovery, the poetic art was in a feeble and inert condition, both in Spain and England. On the other hand, historical studies of all kinds, since they flourish in proportion to the facilities given of collecting facts and materials,—and printing greatly enhanced these facilities,—received a sudden and highly beneficial impulse.

---

[1] Prof. H. Morley.

Caxton.

The first book certainly known to have been printed in England is the *Dictes and Sayings of the Philosophers*, a translation from the French; this was printed by Caxton in 1477, within the precincts of the abbey of Westminster. The monks of St. Alban's soon set up a printing-press in their great monastery; and Oxford and Cambridge quickly followed suit. For fifteen years more Caxton labored diligently in his vocation, and at his death in 1492 left the art of printing firmly established in England. An examination of the list of works which he printed shows what branches of literature were most in esteem in the English society of his day. Professor Craik enumerates forty-five works, which comprise all Caxton's more important typographical performances. Of these, thirteen are religious and devotional, twelve are works of romance and chivalry or other prose fiction, seven are historical or legal works, five are English versions of classical authors, five handbooks or didactic works, and three editions of English poets. To the first class belong the *Golden Legend* (a translation of the collection of lives of saints under that name compiled by Jacobus de Voragine), a *Liber Festivalis*, or guide to church festivals, a *Life of Saint Wynefrid*, and several pious books translated from the French. Under the second head fall Malory's English version of the great French prose romances of Arthur, the *Ryal Book*, a "Troy-book" translated from the French of Raoul Le Fevre, the *Book of Feats of Arms*, and the *Historye of Reynard the Foxe*, translated from the Flemish. To the historical section belong Trevisa's version of Higden's *Polychronicon*, the *Chronicles of England* by Fabian, and the statutes passed in the first year of Richard III. Among the classics offered to the English public were versions of the *Æneid* and of Cicero *De Senectute* and *De Amicitia*, translated from French versions, and Chaucer's rendering of Boethius's *De Consolatione Philosophiæ*. The handbooks contain the *Moral Proverbs of Christine de Pisan*, a *Boke of Good Manners*, a *Boke for Travellers*, etc. The English poets, editions of parts of whose works were printed by Caxton, were, as was to be expected, Chaucer, Gower, and Lydgate.

In the period ending with 1350, we saw that the plant of English literature, though putting out some vigorous offshoots, in the poems of Nicolas of Guildford and Robert Manning, was still struggling with great linguistic difficulties, so that it remained uncertain whether, like Flemish literature in Belgium, it would not have to content itself with appealing to the humbler classes of the people, and leave to France the office of ministering to the intellectual and imaginative wants of all cultivated persons. In 1470 this doubt remained no more; the question had been finally settled in favor of native genius. England had now a literature in her own speech of which she might be proud,—authors whose manner and phraseology supplied models to allied but less advanced nationalities.

James I.

James I. of Scotland, who was killed in 1436, speaks in the *King's Quhair* of the trio of English poets in terms of reverence comparable to those which Chaucer himself, in *Troylus and Cryseyde*, had used of the great poets of antiquity. But this success had only been gained by the wise exercise of that talent for compromise which we English, even to this day, are said to possess almost to a fault. English literature was to employ a language which in its structure and grammar indeed was Teutonic, but was to admit without scruple into its vocabulary thousands of French words which the upper classes, the descendants of the Norman invaders, were in the habit of using. It seemed as if both language and people were destined to hold a position midway between the European nations of Teutonic and those of Latin origin, to be interpreters between the one and the other, and thus to facilitate, for the numerous communities which in due time the English race was to plant over the world, the comprehension of the thoughts and the appreciation of the ideals of both.

Revival of Greek study.

V. *Period of the Renaissance and the Reformation*, 1477–1579.—The decline of the scholastic philosophy in England in the 15th century, as indeed in every other country of Europe, was noticed in the last section. A new interest seized upon all the more lively intelligences,—that of recovering what, having passed into oblivion, might still be recoverable of the works of the ancients, as well as of appropriating thoroughly what was already known. In Latin literature the chief works had long been known; Virgil, Ovid, and even many of the works of Cicero, had for ages been the delight of scholars and the food of poets. But even in respect of these, the greater *publicity* which the multiplication of copies by the printing-press gave to them led to innumerable questions being stirred, which till then had lain comparatively dormant. The problems of textual, philological, and literary criticism, which the careful study of an author suggested to an acute mind, were taken up with eagerness by a large and ever-increasing circle of students. But it was Greek learning, because of the comparative newness of the field, and the inconceivable value of the treasures which it hid, that awakened the most intense and passionate interest. The story of the revival of Greek studies in Italy, towards the end of the 14th century, is as exciting to a sensitive intellect as any romance. Gradually the contagion of the learned frenzy which created a hundred academies and literary societies in the Italian cities spread itself across the Alps. England was but a very little, if at all, behind France. The steps by which a change of so much importance to literature was effected seem to be worth tracing with some minuteness. Without lingering over the names of Gray, Phrea, and Vitelli, by each of whom something was done towards promoting Greek study at Oxford, we will begin with Linacre's master, William Selling. An Oxonian, and a monk of Christ Church, Canterbury, Selling conceived a fervent desire to partake of the intellectual banquet provided in the schools of Florence, where the great Lorenzo was then ruling the republic; and about the year in which Sir Thomas More was born (1480) he travelled into Italy, and attended for some time the lectures of that prodigy of learning and talent, Angelo Politiano. While in Italy he learnt to read and speak Greek, and collected a number of Greek MSS.; but unluckily, soon after his return with these to England, they were destroyed by an accidental fire. Thomas Linacre, a Derbyshire boy, had Selling for his master at the Canterbury school; his capacity and zeal for study were great, and when Selling was sent on a mission into Italy by Henry VII. in 1486 or 1487, he took Linacre with him, and left him studying Greek under Politiano at Bologna. In these studies William Grocyn, an older man than Linacre, is mentioned by contemporaries as his "sodalis." Having been for many years a fellow of New College, he visited Italy between 1480 and 1490, and studied chiefly at Florence, under Demetrius Chalcondyles and Politiano. "Grocyn," says George Lilye, "was the first who publicly lectured on Greek literature at the university of Oxford, to crowded audiences of young men." Grocyn was a somewhat hard, dry man; an Aristotelian, not a Platonist. Plato he regarded as a man who multiplied words, but in Aristotle he saw the founder of real science. His lectures seem to have been delivered between 1491 and 1500. Grocyn left no works behind him; but Linacre, who probably began to lecture in Greek when Grocyn ceased to do so, was a voluminous author and editor. To him we owe editions of the principal works of some of the Greek medical writers, and a Latin grammar, which was superseded in a few years by the more symmetrical *Breviarium* of William Lilye, commonly called *Lilly's Grammar*. An anecdote related of Linacre illustrates the enthusiasm for letters, mingled with a dash of pedantic absurdity, which characterized the age. When about to leave Italy and return to his native country, he erected at Padua an altar, which he dedicated to the genius of Italy; he crowned it with flowers, and burned incense upon it.

More.

More, born in 1480, learnt Greek under Linacre at Oxford, in about the years 1496 and 1497. His *Progymnasmata* and *Epigrams* (the latter written conjointly with William Lilye) are the work of a man deeply imbued and inflamed with the classical spirit.

Colet.

The celebrated Dean Colet, whose eminent services to literature and education have been of late years examined and recorded by Seebohm, Lupton, and others, studied Greek in Italy a few years later than Grocyn and Linacre. He lectured at Oxford after 1497 on the epistles of St. Paul (in Greek), and at St. Paul's, London, of which he was dean, on the *Hierarchies* of Dionysius. The letters of Erasmus present in the clearest light the "perfervidum ingenium" of this remarkable man, who, as the founder of St. Paul's school, may be said still to live and work among us. This school he opened in 1510, appointing William Lilye its first headmaster. Lilye himself was no common man. In youth he had travelled to the Holy Land, and on his return took up his abode at Rhodes, and made himself master of the Greek language. Polydore Vergil even says that Lilye was the first Englishman who ever taught publicly "perfectas literas," by which he appears to mean the Greek authors, but this is certainly a mistake. For the scholars of St. Paul's school, Richard Pace, another Oxford man, wrote, at Colet's request, a pleasant discursive treatise called *De Fructu qui ex Doctrina percipitur* (1518), in which are introduced some interesting details respecting the learned men of that day. William Latimer, a priest and an Oxford man, is continually mentioned in the letters of Erasmus and his contemporaries as a scholar of vast erudition and especially conversant with Greek. But he was diffident, and perhaps indolent, and declined the task of teaching Fisher Greek, which Erasmus urged him to undertake.

It is a lamentable fact that after this brilliant opening of the study of the humanities at Oxford, the dawn was overcast, and a dismal reaction set in. Erasmus tells us that, about 1518, a body of brutal obscurantists appeared in the university, who, calling themselves Trojans, attempted by ridicule and petty persecution to discourage the study of Greek. It was on this occasion that More wrote his *Epistle to the University* (1519), complaining that the party of the barbarians was not put down. The king was induced to interfere, and the nuisance was after a while suppressed. At Cambridge, though the study of Greek appears to have been introduced later than at Oxford, it was carried on without check or discouragement, and was supported by endowments at an earlier period than at the sister university. The excellent Fisher, bishop of Rochester, who was chancellor of the university of Cambridge from 1501 to 1517, and in that time founded, or helped to found, the colleges of Christ's and St. John's, promoted Greek learning with all his energy. He invited Erasmus down to Cambridge in 1511, and procured for him, first, the Lady Margaret professorship of divinity, and afterwards the chair of Greek. He was succeeded by a scholar of some celebrity, Richard Croke, who, after being educated for twelve years at foreign universities at the expense of Archbishop Warham, returned a most accomplished Grecian, and settled at Cambridge. The archbishop just named, the last before the change of religion, was a prelate of great enlightenment and unfailing generosity. Erasmus, who received from him an annual pension and frequent gifts, is never weary of extolling to his correspondents the "sanctissimi mores," the love of letters, integrity, and piety of the English primate. Towards the middle of the century Sir John Cheke, as Milton says, "taught Cambridge and King Edward Greek;" his friend Sir Thomas Smith was also a great promoter of learning.

From the suppression of the monasteries in 1536 to the end of his reign, the violence and brutality of Henry VIII. exercised a baneful effect on the progress of learning. Instead of conferring together about the Greek particles, Oxford men were obliged to consider what they should think and say about the king's divorce. The fate of More, the finest scholar at Oxford, and a writer of European reputation, of whom Charles V. said to the English ambassador, "We would rather have lost the best city of our dominions than such a worthy councillor," dispirited and alarmed all English men of letters. In such dangerous times wariness, quietness, unobtrusiveness, must have seemed to be the one way of safety. When the tyrant died, men breathed indeed more freely; but the rapacity and indifference to letters of Protector Somerset's government must have filled all university men with the feeling that the tenure of their endowments was anything but secure, and such a state of mind is not good for the pursuits of learning. Under Mary there was some revival of literary activity; a collection was made and published of the English works of Sir Thomas More; and new editions of Gower and Lydgate were printed. Warton truly observes, that "when we turn our eyes from [this reign's] political evils to the objects which its literary history presents, a fair and flourishing scene appears." On the other hand, the compulsory revival of the scholastic philosophy at the universities, which involved, as we are told, the depreciation of the new learning, was an unpleasant feature of the times. There is a well-known passage in Ascham's *Schoolmaster*, where, speaking of Cambridge in Mary's time, he says, that "the love of good learning began suddenly to wax cold, the knowledge of the tongues was manifestly contemned; the truth being," he goes on to say, "that plans were laid by the university authorities to bring back the works of Duns Scotus, and all the rabble of barbarous questionists," into the academical course, in the place of Aristotle, Plato, Cicero, and Demosthenes. To throw contempt on the schoolmen,—though it was not confined to the Protestants, for More, Erasmus, Colet, Pace, and many other Catholics had expressed more or less of a similar aversion,—yet was characteristic of them, for their theologians without exception rejected the *Schola*. Therefore Gardiner and Bonner appear to have resolved to force scholasticism on the young men of their day, simply because they did not like it.

Reign of Mary.

Yet at Oxford things cannot have been so bad, for it was in this reign that Trinity College was founded by Sir Thomas Pope, a zealous Catholic, "in the constitution of which the founder principally inculcates the use and necessity of classical literature, and recommends it as the most important and leading object in that system of academical study which he prescribes to the youth of the new society. For, besides a lecturer in philosophy appointed for the ordinary purpose of teaching the scholastic sciences, he establishes in this seminary a teacher of humanity."[1] The accession of Elizabeth brought another change. The schoolmen were again ejected, and with contumely, from English seats of learning. By a singular irony of fate, the name of the owner of one of the brightest and most penetrating intellects ever given to man, Duns Scotus, came to be used, in England, as a synonym for a blockhead. Polite literature was now so exclusively cultivated that it destroyed philosophy. The old systems were discredited, but no new system was adopted in their place. Nor has philosophical speculation ever recovered in England that high place in the hierarchy of the sciences which is its due. In the first twenty years of the reign of Elizabeth, though exact scholarship did not flourish much, there was a great and very beneficial activity in the work of making translations from the classics. The names of Golding, North, Phaier, Marlowe, and Stanihurst indicate the authors of the chief of these. Fairfax and Harrington translated the master-pieces of Tasso and Ariosto. But for the ample store of fresh materials thus supplied, the genius of Shakespeare, who had not a university education, must have displayed itself under comparatively restricted forms.

Translators.

Hawes.

Little need be said of those inferior descriptions of poetry which this period produced. Stephen Hawes, in his *Pastime of Pleasure*, endeavored, but with very imperfect success, to effect that blending of allegory with romance which was to be the brilliant achievement of Spenser. The mind of Alexander Barclay seems to have been swayed by that Teutonic affinity of which we spoke in a former section; he turned to Sebastian Brandt rather than to Petrarch, and preferred the grotesque humor of the *Narrenschiffe* to the sonnets on *Laura*. In Skelton, almost the only poet of the first twenty years of Henry VIII.'s reign, the coarser fibres of the English nature are offensively prominent. His fondness for alliteration, and indifference to the syllabic regularity of his verse, show that he too belonged to the Teutonizing party among the English writers, and that he may be affiliated to Langland and the other alliterators of an earlier age. He occasionally wrote some pretty little lyrics,—witness the musical lines *To Maistress Margary Wentworth*,—but buffoonery and a coarse kind of satire were what his nature prompted him to, and in these he excelled. His attacks on Wolsey's pride, luxury, and sensuality are well known, nor can it be said that they were not deserved; still, as proceeding from an incontinent priest, they remind us unpleasantly of "Satan reproving sin." The macaronic verse in which this poet delighted, a farrago of Latin words, classical and barbarous, French words, cant expres-

Skelton.

[1] Warton.

Surrey.

sions, and English terms clipped or lengthened at pleasure, was called by our ancestors, for many years after his death, "Skeltonical;" but Walton has shown that he did not invent it, but that it was in common use in his time both in Italy and in France. The end of the reign of Henry VIII. was illustrated by the poetry of Surrey and Wyatt. These two writers, having resided long in Italy, and learned, like Chaucer, justly to appreciate the greatness of Italian literature, which none of their countrymen since Chaucer seemed able to do, "greatly polished," as Puttenham says, "our rude and homely manner of vulgar poesie from that it had been before, and for that cause may justly be sayd the first reformers of our English metre and style." To Chaucer's heroic verse Surrey restored the syllabic regularity which it had lost in inferior hands, and stripping it of rhyme, he for the first time produced English blank verse. Into this rhythm he translated part of the *Æneid.* He shares with Wyatt the credit of having naturalized the *sonnet* in English literature.

Dunbar.

Lyndsay.

In Scotland there arose in this period several poets of considerable mark, all of whom, in respect of their turn of thought and the best features of their style, may be properly affiliated to Chaucer. Henryson wrote in "rhyme royal"—Chaucer's favorite metre—the *Testament of Faire Creseyde,* a sort of supplement to Chaucer's *Troylus and Cryseyde.* In the poetical remains of Gawain Douglas, bishop of Dunkeld, there is much melody and sweetness. In the poems of Dunbar the influence of Chaucer is especially noticeable. *The Thistle and the Rose* and the *Golden Terge* are poems of the same class as the *Assembly of Foules* and the *Court of Love;* the allegoric form, and the machinery of dream and vision, are employed in both. Sir David Lyndsay began by being a great admirer and imitator of Chaucer, but the Teutonic affinities of his mind waxed ever stronger, and he ended by gaining great temporary fame as the author of coarse and ribald satires, directed against the abuses of his day, especially those which deformed the church. His latest work, a *Dialog concerning the Monarché,* appeared in 1553.

In the article DRAMA it was described how the modern drama grew up under the shadow of the church, and an attempt was made to convey a clear notion of the mode in which the ancient miracle plays were performed. As the people grew richer and more numerous, and the arts of life were improved, and experience suggested ways of correcting blemishes and adding fresh splendor to the spectacle, these plays were exhibited with ever increasing pomp. Yet, at the same time, the lay spirit getting hold of them more and more, and the religious laxity of the Renaissance attacking the clergy, we find those which date from the 15th century not only grotesque, but gross to the last degree. Their composition in many parts betrays a scandalous accommodation or condescension to the brutality or pruriency of the hearers. Take for instance, the scene called "The Bridal of Mary and Joseph" in the *Coventry Mysteries.* To interest masses of ignorant people it may have been necessary to be simple, broad, and outspoken; but it could not have been necessary to introduce a heap of filthy jokes, not found in the original, gathering round the mystery of the Incarnation, for the sake of raising a horse-laugh, and covering the cheeks of the country girls with blushes. It must be remembered that the entire system of language and allusions in these plays is *contemporary.* Mary's kinsman, Abizachar, is a mediæval bishop, with his court, his sumpnours, and his apparitors; the whole thing is racy of the soil, and redolent of the national humor; you are no more transported into Palestine than a travestie of "Medea" transports you into Greece. The moral effects upon juvenile spectators of so much loose talk, conveyed to them as it was with a *sanction* (for a religious aim was always professed, and indeed as a rule sincerely entertained in these exhibitions), cannot have been of an improving nature.

Miracle plays.

Moral plays.

Udall.

Sackville.

Besides the great serial plays, such as *The Chester—The Coventry*—and the *Towneley Mysteries,* in the successive scenes of which all the principal truths and doctrines of religion, beginning with the creation, and ending with "Doomsday," were represented, a demand arose for special plays, treating of the life, or the miracles, or the martyrdom of some favorite saint. Such were *The Conversion of St. Paul, St. Mary Magdalen,* and *St. Anne,* which may be seen in a MS. in the Bodleian library. These were sometimes performed in the churches, on the festival of the saint celebrated in them, sometimes in the halls of royal palaces or colleges, sometimes again within the precincts of monasteries. Gradually something more refined, more in the fashion, than any miracle play, was called for at courts and colleges. Then arose the moral plays, in which the allegorical treatment and metaphysical refinements which were of the taste of the age were applied to dramatic entertainments. Saints and angels were discarded; and virtues, vices, and abstract notions of various kinds took their place as the *dramatis personæ.* The devil of the miracle plays, who had more and more become a grotesque and comic character, at least in many of them, appeared as the "vice" or "iniquity" of the moral plays, and introduced into them also a corresponding comic element; this "vice," as is well known, was gradually transformed into the clown of the modern stage. Skelton wrote two moral plays, one called *The Nigramansir,* which was performed before Henry VII. and his court at Woodstock, the other *Magnyfycence.* A more ambitious effort was the *Satyre of Thrie Estaits,* by Lyndsay; this enormous moral play was acted before the Scottish court in 1535, and occupied nine hours in the representation. The dulness and tediousness of plays of this kind, owing to the want of human interest, prevented them from holding their ground against the more natural form of the drama which the imitation of the ancients soon introduced; yet Mr. Collier, in his *History of Dramatic Poetry,* has shown that moral plays continued to be written down to the very end of the reign of Elizabeth. Translations and imitations of the plays of Plautus and Terence paved the way for a reign of a purer taste. Sixteen years after it had witnessed *The Nigramansir* the English court was refreshed by "a goodie comedie of Plautus," probably through the instrumentality of Sir Thomas More, who was then in high favor with Henry. The interludes of John Heywood, court-jester to the same king, were another step in advance. The personified qualities are here dropped, and persons take their place; these persons, however, are not yet individuals but representatives of classes, "a pedlar," "a palmer," etc. The earliest proper comedy that has yet been discovered is the *Ralph Roister Doister* of Nicholas Udall, the head master of Eton College. In this play, written to be performed by his scholars, Udall imitates so far as he can the style and manner of Terence. It is divided into acts and scenes, and is written in hobbling alexandrine rhyming lines, which, as containing twelve syllables, *i.e.,* six feet, he obviously thought were the nearest English reproduction of the iambic trimeter. He did not see that the movement of our heroic blank verse, in spite of its being shorter by two syllables, represents more faithfully than any other English metre the movement of the iambic trimeter; while such rough alexandrines as his only recall the Saturnian verse of Nævius. The recognition of the fact that for the English drama the proper metre is the blank verse of ten syllables was due to the finer perceptions of Sackville, who, with Norton, produced the tragedy of *Ferrex and Porrex,* or *Gorboduc,* in 1561; this, the earliest regular tragedy that has been discovered, was played before Queen Elizabeth in the hall of the Inner Temple. For some years the drama continued to be beholden to the hospitality of the court, or some legal society, or educational institution (Gray's Inn, Lincoln Inn, St. Paul's school, etc.), for the local habitation where it might display its illusions. But as the popular delight in such exhibitions increased at this time faster than the Puritanic aversion to them (although this also was gaining ground, as we shall see), it was inevitable that the stage should cease to be movable and migratory, and establish itself in a permanent home. The first public theatre was opened at Blackfriars in 1575; the histrionic art became a recognized profession; many other theatres sprang up before the end of the century; Italian plays were adapted, Latin plays translated, episodes of English history dramatized; and, on the whole, a kind of dramatic atmosphere was generated in the English metropolis, highly favorable to the career of a great artist, should such a one appear.

More.

More's philosophical fiction of *Utopia,* imitated from Plato's *Atlantis,* appeared in Latin in 1516; it is the picture of an ideal commonwealth. The *Governour,* by Sir Thomas Elyot, was also intended to be a political treatise; but under the despotism of Henry the subject was too dangerous, and the author confines himself almost entirely to questions connected with education. The

Fortescue.

earliest good English prose, in Mr. Hallam's opinion, is found in Sir Thomas More's *History of Henry V.*, which appeared in 1513. But the curious treatise by Sir John Fortescue, written more than thirty years before, the *Difference between an Absolute and a Limited Monarchy*, is really very good English, and contains few words that are not now in use; if it were divested of its barbarous orthography, this would be at once manifest. Our prose style was much improved by the various works of Roger Ascham, who taught Latin to Elizabeth, and held learned conversations with Lady Jane Grey.

Controversial writers.

The religious convulsions by which the country was shaken to its centre during this period are of little direct interest to the historian of literature; for the lines of literary development which the activity of preceding ages had marked out were not seriously deflected, nor did the theological controversy produce on either side works which, like Hooker's *Ecclesiastical Polity* or Bossuet's *Variations*, may claim, on account of perfection of style or power of treatment, a permanent place in literature. The Reformers of Henry the VIII.'s reign were the heirs and continuators of "Lollardy," but joined to it, from the armory of Luther and Calvin, new views on predestination, the futility of works, justification by faith alone, and the final assurance of the elect, which had indeed a practical bearing of the most important kind, but were not set forth by our native writers in particularly forcible terms or attractive forms. William Tyndale, who carried on a long and acrimonious controversy with Sir Thomas More, is perhaps the most important writer on that side. Cranmer's writings show much learning, considerable grasp of intellect, and a certain breadth of style; they are deficient, however, in sincerity and manliness. The homely wit and rough satirical power of Latimer are well illustrated in many of his sermons. He, and most of the English Reformers, exemplify in a marked way the Teutonic affinity of which we have more than once spoken; the desire to be sturdily independent, coupled with a sense of teeming latent energy,—of a potentiality of great achievement on this side and on that,—indicate in them at once the strength and the blemish of the Teutonic genius. After the accession of Elizabeth, the leading men among the clergy, refusing to take the oath of supremacy, were for the most part driven into exile, and for many years waged war, in heavy treatise or light pamphlet, against the new settlement of religion. The names of Sander, Harpsfield, Harding, Stapleton, and many others occur in this connection. But as they wrote for the most part in Latin, for the sake of Continental readers, their efforts produced little effect, and are now scarcely remembered. Jewel, the Protestant bishop of Salisbury, who had been in exile at Strasburg under Mary, and contracted a close friendship with Peter Martyr, wrote an *Apology* (1562) in reply to these disputants, from whom the work drew forth loud charges of inaccuracy and unfairness of quotation. The *Apology* was in Latin, but the *Defence of the Apology*, written in answer to Harding, was in English. The laborious exercise of thought on these topics, and the warfare with pen and tongue which was the result, could not fail to increase the elasticity and enlarge the adaptivity of the language, and so far tended to improve it as an organ of literature.

Sidney.

VI. *The Old Civilization in conflict with Puritanism*, 1579-1660.—Regarding the position of the Roman see in the Christian church as a "separable accident," the acceptance or rejection of which made no essential difference, the literary men of the latter part of the reign of Elizabeth, while rejecting, chiefly on political grounds, the authority of that see, had no quarrel in other respects with the religion which had come down to them from their forefathers, nor with the forms of civilization and efforts towards a higher culture which that religion had encouraged. Both in Spenser and Shakespeare we notice a decided repugnance towards Rome, and a disposition to deny her claim to obedience (compare the description of Duessa in the *Faerie Queene*, and the denunciation of papal power put by Shakespeare in the mouth of King John); but with this exception they belong to the old school; they might have been Englishmen of fifty years before, instead of twenty or thirty years after the Reformation. This has been pointed out in detail by Mr. Thornbury and others in the case of Shakespeare; they have shown how alien the notions of Puritanism were to his heart and mind, except in the one point of opposition to Rome. Spenser's description of the house of Cœlia, and his invective against the Blatant Beast, not to refer to many other passages, show that the same thing held good of him. But it is not our object to dwell on this; the point to which we would call attention is, that the poets and dramatists of this period, as well as a large body of the clergy, clave heartily to the civilization and culture which they had inherited from the past. To this form of civilization the Puritan or ultra-reforming party, which began to show its strength under the lax rule of Archbishop Grindal, was radically opposed. The culture which had gathered treasures from every side, and welcomed all that was good and beautiful in paganism, was tainted and abominable in their eyes. To them it seemed that a Christian society should be exclusively formed and built up on models furnished by the Old and New Testaments. To come to the particular tendencies of Puritanism with which we have now to do,—it looked with sour displeasure on the English poetry and drama of the day, and, according as it possessed power, suppressed them. What meant these loose and profane sonneteers by writing about their mistresses in language that was little short of idolatrous, and celebrating Bacchus, Venus, and Apollo in terms which could hardly be acquitted of blasphemy? Why, if they must rhyme, could they not compose comfortable hymns of Zion, and if they must have music, sing the Psalms of David? Expression was given to these sentiments in a pamphlet breathing a spirit of comparative moderation,—the *School of Abuse* of Stephen Gosson (1579). Sir Philip Sidney in his able reply, the *Defence of Poesy*, vindicated the legitimacy of the taste for literature and art which Englishmen had inherited from their forefathers. Again, innumerable allusions in the works of the dramatists of this and the next reign, including Shakespeare, prove the animosity which subsisted between them and the Puritans, whom they rightly regarded as the implacable enemies of their art. On the outbreak of civil war the Puritans, gaining the upper hand in London, immediately shut up the theatres. It is not, therefore, without reason that we have characterized the epoch which we are considering as that of the "conflict between Puritanism and the old civilization."

Poetry, which does not, like the drama in its more developed stages, require any local establishment in order to produce its effects, pursued its flight in defiance of Puritan censure. It was not, however, unaffected by it. The disapproval of him and his works, entertained by a large section among the most virtuous of his countrymen irritated the poet by its exaggeration, and often made him out of recklessness import an additional degree of license into his language. Yet morality was in the end the gainer. For in spite of narrowness, and exaggeration, and occasional hypocrisy, there was real earnestness and virtuous intention in the great body of the Puritans; and to these qualities society eventually did homage by refusing to tolerate, in poetry at least, what was openly and scandalously immoral. In spite of one or two who leap over the line, poetry in the 18th century, and still more in the 19th, has not permitted her votaries to write as they please, but has prescribed to them measure and seemliness. This may indeed be attributed to the increasing refinement of European life, but that refinement itself, so far as it is moral, is to a large extent the work of the Puritan spirit.

Elizabethan literature.

Without further preface let us turn to the consideration of that amazing phenomenon, the literature of the Elizabethan age. Many circumstances, many slowly elaborated changes, had prepared the way. The cautious peace-policy of Elizabeth, her wise love of economy, and her care to surround herself with able counsellors produced their natural fruits in a state of general prosperity never experienced before. Every adventurous and inquiring mind was stimulated by the reports continually arriving of the discovery of "islands far away," of riches and beauty which the earth had hitherto veiled from her children revealed to wondering eyes in America and the East, of inventions which enlarged the power, and discoveries which widened the knowledge of man. Again the greatly augmented use of the language as a literary instrument, consequent upon the religious dissensions now temporarily silenced, had, as already explained, made it a much fitter organ for thought than it had been in the reign of Henry VIII. Lastly, the powerful influences now pressing in from abroad must be duly weighed. The genius of Ariosto had clothed mediæval romance in a splendid garb, which, for the first time since the 13th century, made the subject attractive to cultivated minds. Tasso's epic, with its sustained grace and sweetness, had shown how the shades and half-shades of sentiment in which refined spirits delight can be expressed by corresponding *nuances* of language. Certain eminent writers in France, especially Du Bellay and Ronsard, had consecrated considerable powers and incessant activity to the work of reforming the language and literature of their own country through the concentrated study and fearless imitation of ancient models. Considering all these various elements, we shall be better able to understand how, given a gorgeous imagination like that of Spenser, and a mind of universal range like that of Shakespeare, these writers were able to place that enormous difference between themselves and their predecessors which separates the *Faerie Queene* from the *Pastime of Pleasure*, and the comedies of Shakespeare from those of Still and Udall.

Spenser. Without stopping to criticise, and reserving the drama for separate consideration, we must endeavor by a brief description to convey some notion of the poetical exuberance of the Elizabethan era. Spenser's *Faerie Queene*, a colossal fragment of a still more colossal design, relates ostensibly the romantic adventures of brave knights and fair ladies; but every incident has an allegorical meaning, and the propagation of the several moral virtues is the professed object of the entire work. The well-known stanza which he invented, consisting of nine lines, the last an alexandrine, with three rhymes, is so skilfully constructed and so well adapted to our language, that it has been frequently employed since, with marked success, by eminent poets. Burns used it for the *Cotter's Saturday's Night*, and Byron for *Childe Harold*. The rhymes in it are better arranged than in the standard metre of Italy, the *ottava rima*, because the distribution is such as to bind the whole structure better together, and to avoid that palpable break between the first six lines and the concluding couplet which is noticeable in the stanza of Tasso and Ariosto. Again, the extra syllables in the ninth line seem exactly to counterbalance the risk of *monotony* which the additional line would otherwise entail. Shakespeare. The sonnets of Shakespeare, if we accept the acute interpretation of Mr. Simpson, indicate the influence of some aristocratic friend of the poet, who, having travelled much in Italy and formed the acquaintance of members of the learned "academes" for which Itâlian cities were then famous, had learned from them those Platonizing speculations about love and its kinds—the vulgar, the civil, the chivalrous, and the ideal love—which are partially reproduced in the sonnets. Among Shakespeare's other poems the chief were *Venus and Adonis* and the *Rape of Lucrece*, pieces remarkable for their luscious melody and ornate elegance. The classical and mythological themes attest at once the receptivity of the intellect of Shakespeare, a country-bred youth who had studied at neither university, and the strength of the Renaissance movement, from which no mind, even the most powerful, could then hold itself aloof. Of the same class is Marlowe's beautiful poem of *Hero and Leander*, translated from the Greek of the pseudo-Musæus. George Chapman produced, about 1601, a complete translation of the *Iliad* in long fourteen-syllable lines. It was the first time that this feat had been accomplished in any modern language; and the fact well typifies the intensity of force with which the English intellect was now working in every direction. Southwell. Robert Southwell, the Jesuit, put to death by the Government in 1696, left behind him a few religious poems of great beauty. He is by some considered the first of the metaphysical school of poets; but the credit (or discredit) of that leadership rather belongs to Donne. Marston, Hall, and Gascoigne (the author of the *Steel Glass*) may be regarded as the founders of English satire. Sir Philip Sidney, the ornament of Elizabeth's court, wrote sonnets and songs, which, though imitated from Italian and Spanish models, were freighted by his powerful mind with a burden of thought and passion not to be found in the originals. The attempts of Daniel and Drayton in the epic style (*Wars of the Roses*, *Baron's Wars*), were failures; but wherever we meet with many ventures, it cannot be but that some will fail. Of such poems as Warner's *Albion's England*, or Drayton's *Poly-Olbion*, or Tusser's *Five Hundred Points of Husbandry*, it is unnecessary to speak.

Poetry of conceit. The class of poets to whom Johnson attached the name "metaphysical," while Milton calls them "fantastics," includes Donne their founder, Cowley, Crashaw, Cleveland, and several others. In date they belong rather to the reigns of James I. and Charles I. than to that of Elizabeth. They are distinguished by their fondness for "conceits," or intellectual *tours de force*, the general aim of which was to gain credit for ingenuity, and a deep insight into the nature of things by tracing resemblances or analogies between objects apparently remote and diverse. This poetry of conceit, which nearly corresponded to the *estilo culto* of Spain, is usually said to have been invented by the Neapolitan poet Marini, author of the *Sospetto di Erode*, and by him propagated in France, whence it came to England. It was merely another development of that tendency to the mystical in thought and the far-fetched in language, characteristic of the Gothic ages, which we have seen more fully exemplified in the countless allegories and moral plays of previous periods. In Donne the style is insufferable; "conceits" are strewn about his pages like puns about the conversation of a punster, and they are not half so amusing. Cowley. Cowley, on the other hand, was a true poet; the daring flights of his fancy, the tenderness of his feelings, and the grace and profoundness of his musings, still rescue much that he wrote from oblivion. Composing, in imitation of Pindar (though he did not really understand the Pindaric metres), irregular passages of song which he called "Pindariques," he gave the first example of a class of poems which comprises performances so memorable as the *Alexander's Feast* of Dryden and the *Bard* of Gray. Crashaw, the translator of the *Sospetto di Erode*, is in the highest degree a worshipper of the far-fetched. He is the author of the celebrated line, describing the miracle of Cana in Galilee:—

> Lympha pudica Deum vidit, et erubuit.
> The conscious water saw her God, and blushed.

Waller. Edmund Waller, though his earliest writings betray an affinity to the fantastic school, mixed too much in the world, and had too much good taste and good sense, to go very far with them. He is the English song-writer *par excellence*; his is the only name which we can think of, when Burns is cited for Scotland and Béranger for France. His manner was so good and his style so clear that Dryden calls him the "father of English numbers," and declares that but for him "none of us could write." Pope allows to Waller *smoothness*, but ascribes much more to the influence of Dryden himself:

> "Waller was smooth, but Dryden taught to join
> The varying verse, the full-resounding line,
> The long majestic march, and energy divine."

Elizabethan Drama. In the last section we noticed the rise of true comedy and tragedy, and gave the date of the building of the first regular theatre at the Blackfriars. Returning to the subject, we propose to examine the commencements of the Elizabethan drama in somewhat more detail, treating (1) of the actors, (2) of the plays which they performed, (3) of the stages which they had at their disposal, including under this head their resources of scenery and stage effect.

Players. 1. From an early period of the reign we find frequent mention of companies of players travelling from town to town, and performing in the town-halls, under the sanction of, and with remuneration from, the respective corporations, such of the plays which they had brought as might seem suitable to the audience expected. It is noteworthy that every such company announced itself as "the servants" of my lord this, or the earl of that, and indeed were really such; had they given themselves out for an independent body of players, the stern laws against vagabondage then prevailing would have made them at once amenable to the sharp jurisdiction of the local magistrates. Thus we read of the servants of the Lord Strange, those of the earls of Leicester, Warwick, Derby, etc. These noblemen enrolled the bands of players among their retainers, and probably maintained and gave them wages for a part of the year, but allowed them at other times, under the patronage of their high names and with licenses under their hands, to make a living by entertaining the public. It was the servants of the earl of Leicester who in 1574 obtained from the queen a writ under the privy seal, authorizing them to perform "comedies, tragedies, interludes, stage-plays, and such other like as they have already used and studied, or hereafter shall use and study, as well in the city of London as throughout the realm of England." But when the players prepared to avail themselves of their privilege, a conflict of authorities became apparent. The mayor and corporation of London asserted their right of control over all dramatic performances within the limits of the city, and issued orders providing, amongst other things, that the players whom they might license should contribute half their receipts to charitable purposes. Probably a portion of the corporation was, even at this early period, actuated by Puritan sentiments. The poor players, who under such regulations would have soon found their occupation gone, or at any rate unremunerative, turned their eye to the vacant space between St. Paul's and the river, where stood the ruins of the great convent and church of the Black Friars (Dominicans). On this site, which was outside the jurisdiction of the city, they established the first theatre by converting to their purpose some of the dilapidated buildings. Years passed; the number of the players increased; and in 1589, as we learn from a curious memorial which they addressed in that year to the privy council, they were sixteen in number, "all of them sharers in the Blackfriars play-house." The twelfth name subscribed to this list was that of William Shakespeare; the ninth that of the dramatist George Peele. These facts show that that "separation of powers," which, in the drama as in politics, is the fruit of an advanced experience, did not then exist. The offices of lessee, stage-manager, actor, and play-writer were all combined in these early players. They owned the theatre in which they acted, furnished their own stage, chose their own plays, and, to a greater or less extent, wrote them. After having received the royal license in 1574, this company ceased to bear the name of the earl of Leicester, but described themselves as "Her Majesty's poor players." The trace of this early connection with the court still remains in the appellation "Theatre Royal," assumed by several of the older London theatres.

Plays.

2. With regard to the nature of the dramatic performances, these included, besides those specified in the license to the Blackfriars Company, moral plays and histories. Under the general description of moral play we may include those that were written with a controversial purpose, either for or against the reformation, such as the plays by Bishop Bale, *Lusty Juventus*, *Every Man, etc.* Quite a number of such pieces were put on the stage by the Catholics after the accession of Elizabeth, with the view of turning the new state services into ridicule; these drew down a special prohibition from the Government. Many dramas, called sometimes tragedies, sometimes histories, were on classical subjects, such as *Catiline's Conspiracies* (by Stephen Gosson, who afterwards wrote vehemently against the stage), *Cupid and Psyche*, *Ptolemy*, and plays on the lives of Pompey and Cæsar. The audience being limited, the companies of players numerous, and the expense of scenery and dresses trifling, novelty in the pieces represented became the predominant source of attraction; hence the extraordinary variety of plays produced at this early period. Scriptural subjects were popular; thus among the earliest printed plays are Nash's *Christ's Tears over Jerusalem*, and Peele's *David and Bethsabe.* "Histories" dealt often with personages and events of the ancient world. But they also presented in dramatic forms passages from the story of England, many of which, by tradition and continual discussion, still lived in the memory, and vividly stirred the feeling of the people; and it was natural that dramas of this class, as they came to be planned with more art and composed with greater power, should transcend in interest the dramas with classical plots, and appropriate the name of "histories" to themselves. One of the earliest of these, *The Famous Victories of Henry V.*, was acted about 1580; Shakespeare founded on it one of his historical plays. The history of *Edward II.* by Marlowe, Greene's *James IV.*, and Peele's *Edward I.* all date somewhere about 1590; the older play of *King John* appeared in 1591; and the original plays which, refashioned or retouched by the hand of Shakespeare, come before us as the three parts of *Henry VI.*, seem to have been produced between 1590 and 1595.

Before the time when Shakespeare began to write for the stage, it may be said that several respectable or even remarkable tragedies had appeared, that some good and flowing historical dramas had been written, and that a great variety of interludes, approaching in character to our farces, and not deficient in wit and drollery, had been produced. To prove the above assertion as to tragedy, it would be enough to adduce Marlowe's powerful plays, *Dr. Faustus* and *Tamburlaine the Great*,—the first strong to move the tragic passions, the second dazzling and astonishing us by its soaring rants and gorgeous rhetoric. The clever interludes of John Heywood would alone sustain what we have stated as to pieces of that description. In comedy, on the other hand, very little had been achieved. Of those that were in prose, like Gascoigne's *Supposes* and Nash's *Pierce Penniless*, the rough uncouth language was unrelieved by any wit that could pass muster in a later age. No comedies in verse superior to those of Greene can perhaps be named; and these are disfigured by every kind of literary fault.

The early stage.

3. With regard to the stage itself, the building of the first theatre in London has been already described. But for many years previously temporary theatres had been made out of the court-yards, with their surrounding galleries, of London inns, *e.g.*, the Belle Savage in Ludgate Hill, the Red Bull in Bishopsgate Street, and the Cross Keys in Gracechurch Street. It is to the second of these that Gosson alludes in his *School of Abuse* (1579), when he speaks of "the Jew shown at the Bull," and goes on to describe it so as to make it clear that this was an old play with a plot resembling that of the *Merchant of Venice.* If any one desires it, he may still help his imagination to picture the scene, by going into the court-yard of one of the few old city inns still left, the "Four Swans" in Bishopsgate Street for instance, and imagining a stage erected at one end, the galleries crowded with aristocratic spectators, seated or standing, and the open space below filled with play-goers, of the common sort, admitted at the charge of one penny, and with the canopy of heaven above their heads. Five of these theatrical inns were turned into play-houses between 1570 and 1630. The company that owned the Blackfriars Theatre erected a new one called the Globe in 1594 on the Bank-side, a position corresponding to one on the present Thames embankment; this, being for summer use, was not roofed in. A play-house called "The Theatre" was built at Shoreditch, outside the city liberties, little, if at all, after the time at which the Blackfriars house was opened; near it stood the "Curtain." Other theatres, the Swan, the Hope, the Rose, etc., rapidly sprang up; and it is estimated that not fewer than 200 licensed play-houses existed in different parts of London at the end of the reign of Elizabeth. All this time the players continued to designate themselves, and to be, the servants either of the queen or of some nobleman; without such protection they could not have exercised their functions either safely or profitably. In these primitive theatres no scenery was used; that was first introduced by Davenant after the Restoration. A curtain then, as now, met the spectator's eye on entering; it was slowly drawn up, and he saw a stage strewn with rushes, the side walls hung with arras; a large board with a name painted on it, "Westminster," "Corinth," "Messina," etc., informed him where the scene of the play to be performed was laid; imagination did all the rest. When a battle was to be fought, "two armies fly in represented with four swords and bucklers, and then what hard heart will not receive it for a pitched field?"[5]

Shakespeare.

Amidst such rude surroundings, and with such imperfect appliances, the mighty genius of Shakespeare was fain to live and act. It has been observed that English comedy was less advanced at the time of his coming up to London (about 1586) than the other dramatic forms; and it is in comedy accordingly that his early triumphs were won, and his extraordinary superiority to all his predecessors most signally demonstrated. *Love's Labor's Lost* and *The Comedy of Errors* were probably his first essays; they were followed by *Midsummer Night's Dream*, *Two Gentlemen of Verona*, etc. The versification of dramatic dialogue had been thoroughly reformed by Marlowe, whose sense of rhythm was exquisite; English blank verse had been wrought into a fine and fitting material, ready to receive whatever impression a gifted dramatist might stamp upon it. But Marlowe was no meditative

---

[1] Sidney's *Defence of Poesie*, quoted by Charles Knight in his *Shakspere, a Biography.*

observer of human life, no accurate discerner of human motives. The language, therefore, that he puts in the mouths of his different personages does not greatly vary; they are all apt to take to ranting on the least provocation. Shakespeare added to Marlowe's skill of composition a power of characterization which no dramatist, ancient or modern, ever surpassed. To this power, as its fitting accompaniment, was joined a gift of modulation, by which the language assigned to each character was made suitable to it and to no other, and this with a truth and naturalness which the readers and spectators of every following age have recognized. Again, turning, like Chaucer, with eager longing to the refining influences which came from the south, he adjusted and polished his dialogue with the utmost care, till to the swiftness and evenness of movement which he might have learned from Marlowe he united much of the easy grace of Ariosto and of the sweetness of Tasso. He probably read an immense number of Italian novels, either in the original or in translations; many of his comedies are founded upon such tales. Thus prepared, he could with safety, as in *Merry Wives of Windsor*, deal with home scenes, and a plot of his own invention, without running any risk of falling into the coarseness and vulgarity of *Gammer Gurton*, *George-a-Greene*, and hundreds of other pieces, written by men in whom the Teutonic affinity of the race predominated unchecked. To these qualifications Shakespeare added a sound dramatic judgment, which, as was natural, improved with years and experience, teaching him what to seek and what to shun, so as to secure that popularity which is the test of dramatic excellence. As an acting play, *The Tempest*, written near the end of his career, is far superior to *Love's Labor's Lost*. But to the last he did not attain to supreme excellence in this direction; the unity of action, necessarily sacrificed in the histories, is not always preserved in dramas where its retention would have been easy; nor is that subordination of inferior parts to the central action, which dramatists of less power have often successfully managed, always duly attended to by Shakespeare.

Of neither the comedies nor the tragedies of Shakespeare can it be said that they are in a special sense "dramas of character." The boasting soldier, the lying traveller, the religious hypocrite, the scheming matron, the ambitious tyrant, and many other clearly marked types, are not portrayed for us in the plays of Shakespeare with that sharpness of outline which they present in the works of Plautus, Molière, and Alfieri. The cause may perhaps be sought in the absence from Shakespeare's mind of all exaggeration, and in the fact that without some slight exaggeration these striking dramatic types which take hold on the memory and the imagination cannot be produced. Shakespeare saw men as they are, and so described them; and the consequence is that, although neither Macbeth nor Richard III. exhibits the stock character of the "ambitious tyrant," each displays a special form of ambition, modified, as always happens in real life, by many concomitant qualities and aims, to trace the lineaments of which will reward in a high degree the pains of the literary analyst. It is this quality of essential truth of presentation which has gathered round our Shakespeare's dramas the instructive and beautiful criticism of a Gervinus, the interpretations of a Goethe, and the historic faculty of a Guizot or a Villemain.

In the exhibition of tragic passions, and in the range of the appeal which they make to the moral sentiments of an audience, Shakespeare's tragedies have never been surpassed. Considered as acting plays they are of varying excellence. In *Othello* and *Romeo and Juliet*, both founded on Italian novels, the incidents move on in a swift and well-combined sequence, which, from this point of view, leaves nothing to be desired. *Hamlet*, though from tradition and habit it always attracts large audiences, is better suited for the closet than the stage; the *drag* of the third and fourth acts is undeniable. In none of the tragedies is there any attempt to preserve the unity of time except in *Romeo and Juliet;* here the action is powerfully and successfully concentrated. The Roman plays, based on Plutarch's *Lives*, though they abound in passages of great power and beauty, are not so constructed as to produce the highest dramatic effect.

When we turn to the other dramatists, Shakespeare's contemporaries and successors, the one point about them all that most strikes us is their amazing exuberance. The English genius, as M. Taine in substance remarks, is naturally abundant and full of force; if left to itself, it attends more to quantity than to quality; it is daring and enterprising, and knows not when it is overmatched, as English soldiers are said not to know when they are beaten. Of this national vigor a large proportion was in the Elizabethan times directed to literature, and particularly to the stage. The development of the drama had now gone on without any notable check for many generations. All the artistic faculty of the country which before the Reformation had applied itself to other arts, such as decorative architecture, painting, and sculpture, now, when the scope for the exercise of these was suddenly reduced to the narrowest limits, tended to seek and find a refuge in the Thespian art. Space does not permit of our noticing these dramatists in any but the briefest manner.

Jonson,

Ben Jonson, proud of his learning and his university education, invented most of his own plots, and plumed himself on his strict observance of the unities. In the plays of Beaumont and Fletcher the influence of the Spanish drama, the glory of which had been carried to a great height by Calderon and Lope de Vega, is noticeable. The intensity of Massinger and the pathos of Ford, amid much that is grotesque or repulsive, preserve their dramas from entire oblivion. Other names are those of Webster, Chapman, Heywood, Dekker, Marston, Middleton, and Rowley. The plays of Shirley were at the height of their popularity when, after the breaking out of the civil war, the theatres were closed by order of the parliament. This order is the overt act of Puritanism, by which, after having first complained of, then protested against, then furiously denounced, the abuses of the stage, it proceeds, now that it has got the handling of the civil sword, to remove both use and abuse by force. The violent language of Prynne in the book (1633) to which he gave the title of *Histriomastix* (a barbarous compound signifying "the player's scourge"), though at the time cruelly punished by the Star Chamber, told of a great and increasing force of public opinion behind him, of which he was but the mouth-piece. Puritanism, by the order of suppression, at once avenged the insults and ridicule with which the dramatists had assailed it, and cut down a vigorous scion which had grown up out of the root of the ancient civilization. The drama was restored before twenty years were over; but it was a new creation, and never won the people's love as the old Elizabethan drama had done. It was an affair of courts and coteries, and was almost shaken down by the blunt reproaches of one honest, plain-spoken man, Jeremy Collier. Puritanism possessing itself more and more of the popular conscience, the revival of a *national* drama became impossible. Our theatres are supported by the miscellaneous urban population which is always to be found in great cities; but as a nation we have had no drama since the civil war.

Fiction.

In the department of Fiction we have to note a new transformation of the romance, by which it assumes the form of pastoral novel. The tale of chivalry, modified so as to recommend a religious ideal by Walter Map and his fellow-workers, then passing into the love-story with allegorical embellishments in the hands of Lorris, was further changed by Sannazzaro, Montemayor, and other Spanish and Italian writers, into the love-story with pastoral and mythological embellishments. Here of course we trace the influence of the classical revival; allegory is dropped as too cumbrous; and a florid phraseology, culled from the idyls of Theocritus, the miscellaneous works of Lucian, and other classical or quasi-classical sources, takes its place.

Sidney.

The *Arcadia* of Sir Philip Sidney was suggested by Sannazzaro's pastoral romance of the same name, but can be read with more interest, because we see that it has been made the vehicle by means of which a powerful mind makes known its thoughts on many intricate and important questions, in metaphysics, political science, art, and social ethics. But the prolixity of the work, together with its confused arrangement, would always prevent it from attaining to anything like the popularity which it enjoyed when, and for some time after, it appeared.

Lyly.

The *Euphues* of Lyly, a kind of philosophical novel, written in an affected and pedantic style, has, since the ascription to its influence by Sir Walter Scott of the magniloquent bombast which he puts into the mouth of Sir Piercie Shafton in the *Monastery*, and considers to be characteristic of the conversation of courtiers at that period, given rise to the term "euphuism." Yet it must be allowed that Sir Piercie Shafton's talk is quite a caricature of the language in *Euphues;* of the two, it more resembles the high-flown language that we meet with in Sidney's *Arcadia.* The *Mundus Alter et Idem* of Hall (afterwards bishop of Norwich) is a satirical romance, written from the clerico-despotic point of view, in the aim of exhibiting the debasement which the principle of democracy, if carried out consistently and over a long period, would, according to the author's theory, bring upon both social and individual man. One of the last and most pernicious delusions of the infatuated community described in the book consists in establishing "a perpetual parliament." Such were the advisers, obeying whose fatal suggestions Charles I. reigned eleven years without a parliament, and brought things to a pass whence civil war was the only issue.

Hooker. Taylor.

In the *Ecclesiastical Polity* of Richard Hooker published near the close of the 16th century, a solid intellectual basis, illustrated by great learning and the attractions of a grave and majestic style, was for the first time given to the conception of the *via media,* in which Anglican churchmen believed they saw a secure shelter for moderate minds, midway between Rome and the extreme forms of Protestantism. The work is naturally directed rather against the Puritans, who were numerous both in church and state, and might eventually, as in fact they did, gain the upper hand, than against the Catholics, whom the laws already silenced and disarmed. The restiveness of the Puritans under the existing laws and church ordinances, which, as they thought, left religion insufficiently reformed, suggested to Hooker an inquiry into the nature of laws and the grounds of their binding force; this is the subject of the celebrated disquisition in the first book. The Puritans were not convinced, and the struggle between them and the Anglicans went on increasing in violence, until, after the outbreak of war, the ascendency of the Puritan element in the Lower House, and the secession of most of the peers to Oxford enabled its enemies temporarily to suppress the established church. During the suppression, a work of great ability, entitled *A Discourse on the Liberty of Prophesying* (1647), appeared from the pen of Jeremy Taylor. Fifty years have made a great difference; the champion of Anglicanism no longer insists on obedience, but pleads for toleration; if only the church of England could be established again in certain districts, he would be willing to see the worship of many different sects, provided that they all agreed to accept the Apostles' Creed as a common standard, carried on in other parts of the country. The lapse of a few years restored to the church its former status without any damaging concessions, and the question of toleration was laid by till the Revolution.

Bacon.

The scholastic philosophy fell, as we have seen, at the change of religion; and for some time nothing took its place. When philosophical studies were revived, they took a new direction, and were pursued in a new spirit. The old philosophy, summing up the wisdom of Greece and that of the Christian schools, said to the student, "Know God, know thyself; from this twofold knowledge learn what is duty; that done, investigate at discretion either nature or the world of ideas." In practice, however, a dry logic and metaphysic, encumbered with technicalities, formed the sole intellectual pabulum provided for most students of philosophy. The new doctrine, introduced by Bacon, said, "Know Nature, and for that purpose study thy own mind, and discover the criteria by which Nature's ways may be tested; the knowledge so gained will be *power,* which, well used, will enrich and adorn human life." Mr. Hallam, representing the general English opinion, calls Bacon "the father of modern science;" but his claim to the title is disputed both by the French and by the Italians. However this may be, it is certain that he very early conceived the idea of working out a new and complete system of philosophy; and to a juvenile work unfolding his project in outline, which seems to have been written about 1584, he gave the title *Temporis Partus Maximus,* the greatest birth of Time. The phrase sounds arrogant, but was not really so; all that Bacon meant to say was, that the new doctrine was the inevitable outcome of a time now ripe for its reception,—the growth of the Zeit-geist, to use a modern phrase,—and that it was impossible to overstate its importance and potency. But his life was too much taken up with active labors at the bar, on the bench, and in the council-chamber, to permit of his carrying his vast plans into execution. All that we possess of his philosophy is contained in the *Advancement of Learning* (1605), the *Instauratio Magna* (1620), and the *De Augmentis Scientiarum* (1623). The *Instauratio* is a colossal programme of his philosophy in six divisions, of which only the second, the "Novum Organum," is worked out, and that not completely. The "Novum Organum" was designed to be the new logic of induction, which Bacon regarded as the mind's proper instrument in utilizing the fruits of experience. "Experience and observation are the guides through the Baconian philosophy, which is the handmaid and interpreter of nature."[1] Nevertheless the particular instrument which he invented, the method of instances, is too cumbrous for practical use, and in fact never has been employed in physical inquiries. "If we have not tried it," says Mr. Ellis, in one of his exceedingly able introductions to the works of Bacon, "it is because we feel confident that it would not answer. We regard it as a curious piece of machinery, very subtle, elaborate, and ingenious, but not worth constructing, because all the work it could do may be done more easily another way." It is not in virtue of his method, which will not work, nor on account of special contributions to any branch of physical science, for none such exist, that so high a place among philosophers is assigned to Bacon by his countrymen. It is rather on account of the lofty enthusiasm which animates his writings, and makes him appear in them as the hierophant of Nature, eloquently pleading against the neglect of her worship.

Hobbes.

The edifice of Christian philosophy lay in ruins, as we have seen, from the time of the Renaissance; Bacon offered a partial substitute, designed to endow man with power over nature; it was left for Hobbes, his assistant and disciple, to make an attempt to occupy the whole of the ancient field of thought. He desired to instruct mankind as to the origin, nature, and value of their conceptions respecting God and themselves, to investigate the moral nature of man, and to define the forms of guidance and of conduct best suited for a being so constituted in mind and heart. His principal work was published in 1651 under the title of *Leviathan.* The fundamental principle from which he starts is, that every thought which can arise in the mind of man is a "representation or appearance of some quality of a body without us, which is commonly called an object." "There is no conception," he proceeds, "in a man's mind which hath not at first, totally, or by parts, been begotten upon the organs of sense. The rest are derived from that original." The doctrine of innate ideas, and every suggestion that it is possible for man to obtain real knowledge otherwise than through the reports of the senses, are by this preliminary tenet rejected. He proceeds, with the utmost acuteness, and a power of close and sustained observation which is truly admirable, to analyze the more important conceptions concerning God, time, infinity, substance, etc., which find a harbor within the mind. His explanations and definitions on all these heads bear, as might be expected from his primary tenet, a strong materialistic impress. He is also a nominalist; all objects, according to him, exist singly and separately; the only universal is the *name* given to a number of objects which agree in certain given respects; the belief in the existence of universals as *ideas* he rejects, not as erroneous, but as absurd; nothing exists for him between, or besides, the object, and the human faculties perceiving and naming it. Of the belief in a God he says that "by the visible things of this world and their admirable order a man may conceive there is a cause of them, which men call God, and yet not have an idea or image of Him in his mind." "As God is incomprehensible, it follows that we can have no conception or image of the Deity; and consequently all His attributes signify our inability or defect of power to conceive anything concerning His nature, and not any conception of the same, excepting only this, that there is a God." In spite of statements of this kind, which are obviously capable of being taken in a good sense, it has been customary to regard Hobbes as an atheist. The cause is found in the complete inadequacy of his system of morals to make good what might be wanting in his speculative tenets. It is not the omissions and one-sidedness of his metaphysics alone, but it is these, coupled with the perversions in his moral philosophy, which have affixed to his name a reputation for atheism. The doctrine of the existence of God, even attenuated to the form which we have seen above, might have been sufficiently integrated by a sound doctrine respecting the human conscience, the best witness for God, according to the general belief, that it is in man's power to appeal to. But when we examine Hobbes's teaching on moral matters, we find it full of paradox and absurdity. Every passion and feeling which can move the human heart is, according to him, the more or less disguised offspring of self-love. He scoffs at the very notion of free-will. The warnings of conscience are merely the fear of something disagreeable happening to ourselves if we proceed in a particular line of conduct towards our neighbors. Justice and virtue are chimeras; that is just which is commanded by the laws, or which a man has covenanted to do; that is virtuous which tends to the general well-being of the community in which we move.

---

[1] Hallam.

Hobbes's views on civil society and government were first given to the world in his *De Cive* (1647); but this was afterwards incorporated in the *Leviathan.* The state of nature, he holds, is a state of war; each man has, until he is restrained, a natural right to take everything around him for his own use; every other man has an equal right; war is therefore inevitable. But men find that in the long run peace conduces to their enjoyment more than war; they are willing, therefore, that the natural right which each possesses should be abridged, and with this end in view they enter into a covenant under which a government is set up over them, charged with maintaining peace, and attending to their welfare in other ways. After this has been done, the subjects cannot change their government without its consent. There are three possible forms of government,—monarchy, aristocracy, democracy,—in each of which the sovereign power cannot be limited or divided. He appears to have thought the limited monarchy of England a vicious form, which events had shown to be practically untenable, the division of power between sovereign and democratic assembly having led to civil war. Of the three forms he much prefers monarchy, that is, absolute monarchy. He thinks it even more important that the sovereign should not be hampered by any opposition on the part of the priesthood, than that he should not be disturbed by the democracy. Accordingly he insists that the state and the church should be the same body under different aspects, the sovereign of the one being also the supreme head and ruler of the other. The sovereign, if he be a Christian, is to determine what religious dogmas shall be taught by the clergy, and to be the judge in the last resort on questions affecting those dogmas. "This," as Mr. Hallam observes, "is not very far removed from the doctrine of Hooker, and still less from the practice of Henry VIII."

There is ample evidence that the philosophy of Hobbes exercised a baneful influence on the morality of a large number of educated men in the last half of the 17th century. But for his love of paradox, this influence would doubtless have been still greater. In an eloquent peroration, Mr. Hallam thus sums up his examination of the political and ethical writings of the philosopher of Malmesbury:—"The political system of Hobbes, like his moral system, of which, in fact, it is only a portion, sears up the heart. It takes away the sense of wrong, that has consoled the wise and good in their dangers, the proud appeal of innocence under oppression, like that of Prometheus to the elements, uttered to the witnessing world, to the coming ages, to the just ear of heaven. It confounds the principles of moral approbation, the notions of good and ill desert, in a servile idolatry of the monstrous leviathan it creates, and after sacrificing all right at the altar of power, denies to the Omnipotent the prerogative of dictating the laws of His own worship."[1]

VII. *Reaction and Counter-Action,* 1660–1700.—At the Restoration, the king and his personal friends, who had lived abroad during the Commonwealth and Protectorate, brought to England a sense of fitness in things literary, and an aversion to what was grotesque and exaggerated in style, which they had picked up in the polished society of the French salons. In poetry, perhaps, no reform was needed. The prevalence of good taste and good sense, assisted by the example of Milton, who in his juvenile poems scorned to use the "new-fangled toys" of the fantastic poets, had already condemned the school which delighted in "conceits." There is a purity of form in the odes of Waller, in the works of Denham, and even in much that in his later years came from the pen of Cowley, which prevented exception being taken to them on the score of refinement. With regard to prose style and the drama the case was different. When men looked back for twenty years and more to the theatre as it was before the troubles, and remembered the plays of Jonson and Shirley, they felt that there was much need of a change. The gay young *roué* of Jonson's plays is a coarse, brutal, and insupportable personage; his "clenches" and sallies are not wit, but the noisy outcome of a superficial cleverness, aided by a flow of animal spirits. The easy badinage and well-managed *double entendre* of the French comic stage were new phenomena, of which that of England had never had the least conception. Nor, in tragedy, was there any inclination to return to the piled-up agony—"horror on horror's head"—of the plots of Ford and Fletcher. Corneille had shown that the sentiments of honor and love in their chivalrous intensity, when exhibited as in conflict with the harsh demands of circumstance and the world, are capable of producing the finest tragic situations. Dryden's heroic plays (*The Indian Emperor, The Conquest of Granada,* etc.) were up to a certain point imitations of Corneille; the extent to which they are sensational and crowded with incident was a feature taken from the theatre of Spain. The verse is rhymed in imitation of his French models; and in more than one of his prefaces or essays Dryden ably urged the claims of "his long-loved mistress, Rhyme," as an indispensable decoration without which the requisite weight and dignity of the tragic style could not be attained. In the article on the DRAMA (vol. vii. p. 375), notice has been taken of the chief works, both in tragedy and comedy, produced by our dramatists between the Restoration and the end of the century. Dryden, whose power and insight grew with advancing age, recognized, after devoting himself to the heroic style for years, the superiority of Shakespeare, abandoned rhyme, and produced in 1690 his finest play, *Don Sebastian.* But it was then too late to arrest the decay of the drama. The Dutch king who then sat on the Stuart throne, the Dutch army which had placed him there, the exultation of the Whigs and the dissenters, were all so many indications that the Teutonic element in the English mind was again in the ascendant. And the ascendency of the Teutonic element, then still more than in previous ages, on account of the gulf which had been established between the Teutonic and Latin races by the Reformation, implied the predominance of an energy which preferred strength to grace, the useful to the beautiful, industry to art. All these impulses were of course only confirmed by the religious and moral views which are grouped under the general name of Puritanism. The drama, therefore, being in opposition to the prevailing spirit, fell ever lower and lower; and though momentarily uplifted, in later times, by the genius of a Goldsmith or a Sheridan, it has never regained its hold upon the nation. A modern critic has compared our drama, commencing with the Elizabethan age and ending with the present day, to a huge pyramid which stands on a broad and magnificent base, dwindles continually, and ends in nothing. Even at this day, there is still too much of the Puritan temper in general society to admit of the success of any proposal in parliament tending to the encouragement and support of the drama by the state, as a department of national culture.

Decline of the drama.

Prose style.

The prose style of the French writers was, at the time of the Restoration, much superior to ours. We had no one to oppose to Segrais, Fontenelle, Balzac, Voiture, Menage, and Bouhours, to select only the principal names among the French critics and *beaux esprits.* Nor was this superiority of our neighbors sensibly diminished till the next century, when Addison, Steele, and Swift redressed the balance. Yet it must be conceded to Dryden that the prose of his numerous essays, prefaces, and dedications, prefixed or subjoined to his published plays (especially the *Essay on Dramatic Poesy*), is incomparably more polished and more effective than any of the rude attempts at criticism which our writers had hitherto attempted. There is, however, a certain wildness clinging to Dryden's style, in spite of his efforts to improve it, and in spite of his wit and the promptitude of his vivacious intellect: one never feels quite secure against the occurrence of a solecism. Hobbes's style is more unexceptionable; he had resided much in France, and consorted with French *literati,* and thus learned the charm of a perfectly clear and simple way of writing. Among the divines of this age there was much eloquence, much richness and force, but little good style. Nothing can be more copious than Taylor, but it is a *cloying* manner; his facility of speech and coining imagination are masters of him, not he of them. Isaac Barrow, who died in his forty-seventh year in 1677, seems to be the best of them; he has more self-command than Taylor, more earnestness than South, and more dignity than Baxter. Against Tillotson's style no particular objection can be urged, except that it does not prevent his *Sermons* from being dull and dry.

---

[1] *Literature of Europe,* vol. iii.

Bunyan.

In the *Pilgrim's Progress* of John Bunyan (1684) the style, without being elevated or distinguished, is plain and manly. It is of course free from pedantry, which cannot be where there is no learning; but it is also free from affectations, and—almost always—from vulgarity. It is interesting to observe in this,—the most popular English work of the century,—the revival of the old allegorical way of writing which was so much relished in the age of Chaucer. Mr. Hallam remarks that there is some inconsistency or defectiveness of plan; the persecution of the pilgrims in the city of Vanity, and the adventure of the cave and the two giants, might with equal propriety, so far as the allegorical meaning is concerned, have been placed at any other stage of the pilgrimage. This is true; but it is only saying that in these passages the tale overpowers the allegory; considered as incidents in the tale, they could not have been better placed than where they are.

Hudibras.

In the heyday of reaction against the hypocrisy and violence of the Puritans, it may be imagined that neither they nor their principles found any quarter. A long satire in doggerel verse, the *Hudibras* of Samuel Butler, one of the best second-rate poets of the day, was especially devoted to their discomfiture. The general texture of this poem is loose and careless; the versification, as a rule, too unpolished to invite to a second reading; still there are epigrammatic couplets and sarcastic descriptions in it which will be remembered while English literature endures. Denham, best known as the author of the pretty descriptive poem of *Cooper's Hill*, wrote many pieces in the spirit of the reaction, which in him, as in Davenant and others, went to the length of identifying Puritanism with Christianity, and rejecting both together. Such at least seems the natural conclusion to be drawn from a perusal of Denham's strange poem entitled *The Progress of Learning*.

Dryden.

In Dryden's poetry the temper and policy of reaction are exhibited with great distinctness. At first, and for many years after the Restoration, his attacks are chiefly upon the political side of Puritanism; he rings the changes on "rebellion," "faction," "disobedience," and "anarchy." In *Absalom and Achitophel* (1681) he argues, with that skill of ratiocination in metre which never forsakes him, against the tenets of democracy and the absolute right of a majority:—

> "Nor is the people's judgment always true;
> The most may err as grossly as the few."

In *Threnodia Augustalis* he talks of "senates insolently loud;" and in the *Hind and Panther* (1687) cleverly presses home against the clergy, who were grumbling at the arbitrary acts of James II., their own declared principles of "passive obedience" and "submission for conscience' sake." In middle life Dryden began to take a lively interest in the controversy on the grounds of religious belief; we see him in the *Religio Laici* (1681) perplexing himself with the endeavor to ascertain the limits of the province of authority and that of private judgment. Waiving the question as to the entire sincerity, or rather disinterestedness, of his conversion, we find him, after that event, exemplifying the reaction against Puritanism in an extreme degree; as he had magnified the authority of the prince in the political sphere, so now he magnifies the authority of the church in the religious sphere. The *Hind and Panther*, as all the world knows, is a theologico-political dialogue, disguised under a thin, a very thin, veil of allegory, on some of the questions debated between the churches of Rome and England, and also on some of the political theories then in vogue.

Congreve.

As for the drama, the mere fact of its revival was a part of the reaction against Puritanism. In the coarse play of *The Roundheads, or the Good Old Cause*, by Mrs. Aphra Behn, which came out shortly after the Restoration, some of the great Commonwealthsmen are exhibited on the stage, of course in an odious light. Dryden kept clear, in his dramas, of scurrilities of this kind, probably because he himself had been brought up among Puritans. In the famous play of *Sir Courtly Nice* (1685) by Crowne, the character of the Whig-Puritan, Mr. Testimony, is a compound of hypocrisy, knavery, and cowardice. Yet at the time when this play was represented, the party of the counter-action, represented now by the names of Whig and dissenter, was already so strong that Crowne could say of them in his dedication to the duke of Ormond,—"There were no living, if some great men, elevated not only in quality but understanding above the rest of the world, did not protect us [the dramatists] from those barbarians, because they know us." After the Revolution there was a truce; the comedies of Congreve and Wycherley have no political bearing. The comic stage was hardly, if at all, employed for party purposes till the reign of Queen Anne, when the strong high-church temper which prevailed in the country caused the revival of *Sir Courtly Nice* (1711). A few years later Cibber, in his play of the *Nonjuror*, imitated from Molière's *Tartufe*, attacked the nonjurors and the Catholics in the interest of the Hanoverian succession. As altered by Bickersteth, the same play appeared soon afterward with the title of *The Hypocrite;* here dissent is attacked in the persons of Dr. Cantwell and Mawworm.

Locke on government.

In political philosophy the reactionary spirit was represented by Sir Robert Filmer, who, in his *Patriarcha* (1680), argued that legitimate kings inherited the absolute power over their subjects, which he assumed Adam and the patriarchs to have possessed and exercised over their families. This doctrine was opposed by the republican Algernon Sidney, and also by Locke, whose admirable *Treatises on Government* appeared in 1688. Though not indisposed to admit that the monarchical constitution of existing kingdoms was originally *imitated* from the patriarchal rule, which in the infancy of society is known to have existed, nay, which still exists in families and clans, Locke denied that this imitation implied any devolution of right or power; the origin of civil right he sought, like Hooker, in a contract, expressed or implied, between the governors and the governed, which bound the one to govern on certain prescribed terms, that is, according to law, and the other to obey the lawful commands of the government. It is well known that this doctrine of an original contract found its way into that celebrated state-paper, the Declaration of Rights, in which it is asserted that James II. had "endeavored to subvert the constitution of this kingdom, *by breaking the original contract between king and people*."

Milton.

In other departments of literature as well as political philosophy, the counter-action strongly asserted itself. Milton, "on evil tongues though fallen, and evil times," knew that he should "fit audience find, though few," when at the close of life he gave his long-promised service to the epic muse, and sang "an elaborate song to generations." The *Paradise Lost* is indisputably the work of a great and lofty mind,—of a mind armed by nature with an astonishing moral energy, and equipped with powers of imagination and conception suitable to the charge of a vast enterprise. This is the more apparent, because the diction of the poem certainly falls below the standard of purity and evenness which the best writers of the day had reached, while the peculiar nature of his subject involved Milton in the greatest difficulties. A number of awkward and ill-sounding words, the use of which would fix the note of pedantry on any one else than Milton, were formed by him from the Latin, and freely employed in the *Paradise Lost;* how injudiciously, the mere fact that not one of them has held its ground and come into common use is sufficient to prove. The subject,—belonging neither to history nor legend, so that details could not be supplied by tradition, and could only be invented at the imminent risk of profaneness,—was baffling by its very grandeur and simplicity. It did not in itself present a sufficiency of changes and incidents to furnish out the material of a long epic composition; hence Milton was obliged to have recourse to episodes, with which nearly half the poem is taken up. It is noteworthy how weighty and dignified a rhythm blank verse becomes in his hands. Never, as used by him, does it even tend to be the dull, insignificant, tiresome metre which it was in the hands of later writers, *e.g.*, Thomson, Young, and even Wordsworth, in their negligent hours. Milton, in whose eyes the Cavaliers of the Restoration were—

> "The sons
> Of Belial, flown with insolence and wine,"

neither wished nor expected to be read at court. Forty years later, when counter-action had accomplished the Revolution, and Whiggism had secured much of the ground from which its parent Puritanism had been contemptuously thrust back, Whig critics like Addison found no difficulty in gaining a hearing, when they pressed upon general society the consideration of the surpassing claims of the *Paradise Lost* to the admiration of Englishmen.

In the department of history, the reaction produced, in Clarendon's *History of the Rebellion*, a masterly and enduring work. The writers of the counter-action were also busy in this field; and Burnet's *History of the Reformation* (1679) was thought to lend so much support to Protestant and liberal principles that he received the thanks of the House of Commons for writing it.

The materialistic empiricism of Hobbes gave place in this period to what has been called the sensistic empiricism, or sensationalism, of Locke. Inasmuch as this philosopher struck two important blows at principles which the Whig-Puritans detested,—at the principle of authority, by deriving all human knowledge from experience, and at the doctrine which ascribes reality both to the accidents, or sensible qualities, of objects, and to the substances in which they are supposed to inhere, by (with Descartes) awarding mere subjectivity to accidents, and relegating substance to the region of the unknowable,—he may properly be regarded as the philosopher of the counter-action.

Locke's Essay.

The first book of the *Essay on the Human Understanding* (1689) is devoted to the endeavor to disprove the doctrine of innate ideas. Yet, when we proceed to examine Locke's own view of the origin of our knowledge, it would appear at first sight that he admits one source which is independent of the reports of sense. Our knowledge, he says, is made up partly of ideas of sensation, partly of ideas of reflection. These last are supplied to the mind by its own operations; we *know* that we think, believe, doubt, will, love, etc. Now, if these operations were assumed to have any other basis than sensible experience, ideas of reflection might be a source of knowledge independent of the senses. But as his argument proceeds, it is evident that Locke had no such meaning. All such mental operations, in his view, are dependent on the mind's having previously been supplied with ideas by the senses. "In time the mind comes to reflect on its own operations about the ideas got by sensation, and thereby stores itself with a new set of ideas, which I call ideas of reflection." This and many similar passages are decisive as to Locke's belief, that there is but one original gate of ideas, viz., the senses. The mind at birth is a *tabula rasa*, or, to use his own illustration, a "sheet of white paper;" whatever knowledge it afterwards acquires is written on it by the finger of experience. This denial of *a priori* knowledge was not effectually confuted till the rise of Kant, near the close of the 18th century. It followed from Locke's principles that belief in revealed religion (which in his case was perfectly sincere) was simply and entirely a question of external evidence. If the evidence for the truth of the alleged fact or doctrine appeared sufficient, the mind would accept it; if not, reject it; but no principle inherent in its own constitution could be appealed to in either case to aid its judgment; for on Locke's system no such principles existed.

VIII. *The Age of Queen Anne*, 1700–1729.—Weary of life, Dryden had descended into the tomb; and his mantle had fallen on no poet. Grateful for support manfully rendered when all the world was against him, he had, in some moving and musical lines, designated in Congreve the successor to his fame—

> "Let not the insulting foe my fame pursue,
> But shade those laurels which descend to you:"

Addison.

but that cold man of fashion never rose above the point which he had reached in the *Mourning Bride*. A poet, however, appeared before long, but he was a Whig poet; that is, he represented respectability, common sense, and the *juste milieu*;—the cause which fires the blood, the ideal which kindles the imagination, were strange to him. This was Addison, whose *Campaign* (1704), an heroic poem on the battle of Blenheim, is much in the style of that portion of Dryden's *Annus Mirabilis* which describes the duke of York's victory over the Dutch fleet, but is written with more care and more concentration. To the production of *Cato*, a tragedy which observes the rules, and aims at exhibiting the lofty grandeur and the devotion to principle of the Roman character, Addison seems to have been induced partly by his protracted stay in Italy (where his attention was engrossed by classical monuments, and turned with indifference from mediæval), partly by the desire to win laurels in the field where Corneille and Racine had shone with such distinction, and to show that an English dramatist could be as *correct* as they. No other poem of note, with the single exception to which we shall presently refer, was written in the reign of Anne. The innumerable verses composed by Swift were written rather to give vent to his spleen, and exercise his misanthropic humor, than under the presence of any motive which ordinarily influences poets. Parnell wrote one or two didactic pieces, and Rowe some pastoral ballads, which are not without merit. Defoe's satirical poems, *The True-Born Englishman* and the *Ode to the Pillory*, possess the interest which the indomitable character and caustic humor of the man impart to them. As a dissenter, he felt properly grateful to the Dutch prince, one of the first acts of whose reign was to establish a legal toleration, and was equally indignant with the clergymen and gentlemen of England, who, though glad to be rid of James II., felt sore at the thought that the Revolution was effected by foreign regiments. This feeling led to a temporary insistence in society on the fact that a man was *an Englishman born;* and it is this insistence which Defoe assails with homely but effective ridicule in the *True-Born Englishman*. The *Ode to the Pillory* was written while its author lay in prison, awaiting his public exposure in that "state machine" for having written *The Shortest Way with the Dissenters*. This was an ironical pamphlet occasioned by the disgust with which Defoe was inspired by the conduct of the wealthy dissenters in London, who occasionally conformed to the worship of the establishment in order to qualify themselves under the Test Act for holding office. Defoe recommends the passing of an Act by which a dissenter attending a conventicle shall be made punishable by death or imprisonment for life. Many of the clergy took the pamphlet seriously, and approved of it; when it was discovered that the advice was ironical, the exasperation against Defoe was so great that it resulted in his being condemned to pay a heavy fine and to stand in the pillory. The *Ode* has a nervous strength, almost dignity, of style, which can seldom be asserted of the writings of Defoe. Referring to this incident, Pope, whose Catholic rearing made him detest the abettor of the Revolution and the champion of William of Orange, wrote in the *Dunciad*—

> "Earless on high stands unabash'd Defoe"—

though he knew that the sentence to the pillory had long ceased to entail the loss of ears.

Defoe.

Pope.

The exceptionally remarkable poem to which reference was made in the last paragraph was Pope's *Essay on Criticism*, which appeared in 1711. Of all such poems the *Ars Poetica* of Horace is the original model—a model, it may be added, which has never been surpassed. The classical taste, and the desire to conform to the ancient rules, which had obtained a complete ascendency in the literary circles of France during the reign of Louis XIV., were now almost equally prevalent in England. Boileau's *Épitre sur l'Art Poetique*, and the critical writings of Bossu, Bouhours, Dacier, and Sarasin, led to the appearance in England of such works as Roscommon's *Essay on Translated Verse*, Sheffield's two *Essays*, on satire and on poetry, and the critical attempts, in prose, of Rymer and Dennis. The receptivity and power of Pope's intellect were naturally employed at an early period of his career on a line of thought, in literature and art, which interested so many able minds, and was, so to speak, in the air. He lays down in the *Essay* rules for the guidance of critics in judging, which, he contends, they are as much bound to observe as poets are to follow the rules of art in writing. The acuteness of observation, the terseness of definition, the brilliance of wit, and the keenness of polished invective which distinguish the *Essay*, render it, though containing little that is absolutely new, a composition of which English literature may well be proud.

But the chief literary achievements of this period were expressed in prose. Prose is the medium which befits the *seculum rationalisticum* which is now opening, an age in which men do not trouble themselves about new ideas, but reason and debate upon those which have been already manifested. Ideas possess themselves of the whole man, and impel him to remodel his life in accordance with them. The idea of the theocratic republic, growing into distinct shape in the minds of Milton, Cromwell, and other Puritans, drove them to march through war, regicide, and revolution, towards its accomplishment. The idea of hereditary monarchy, ruling by virtue of a right of which the origin is lost in the mists of a venerable antiquity, and is therefore assumed to be divine, animated the Jacobites of 1700, as it animates the French legitimists of our own day. But neither of these two ideas had, after turning England upside down, succeeded in establishing itself; the country had acquiesced perforce in a compromise. The partisans of the theocratic republic were forced to put up with king, constitution, law, and an Erastian church; nevertheless they were tolerated, and even allowed to write and preach what they pleased, so long as they did not openly advocate sedition. The partisans of hereditary monarchy were forced to accept a king, and then a queen, and then a whole dynasty, whose rights had no older or more sacred origin than the Acts of Settlement of 1689 and 1701; still some deference was paid to their cherished sentiments, inasmuch as the new stock of royalty was not sought from an alien tree, but was a scion, though not the legitimate scion, growing from the old Stuart trunk. With this makeshift English loyalty was fain to be content. Thus on both sides the consistent theorists, the men of an idea, were discountenanced; and the *via media* in politics and religion, since it seemed to be the only practicable path, was more and more frequented by men of sense. Then a host of reasoners and debaters arose, bent upon showing, not that the compromises were logically sound, which they could not do, but that the extremists were dangerous fools. Moreover, since the compromise might be held and viewed from opposite sides, endless debate was possible, and actually arose, as to the right way of viewing it, whether mainly as a concession to liberty and democracy, or mainly as the guarantee of order and conservatism. In contests of this kind the pens of many able writers were engaged in the reign of Anne; we may mention in particular Swift, Steele, Addison, and Arbuthnot. We will briefly examine their chief performances, first in general literature and then in theology and philosophy.

Political compromise.

Swift.

Swift, appointed to the deanery of St. Patrick's in 1713, was generally believed to have no faith in revealed religion, but to adhere to what we have called "the compromise" for the sake of what he could get by it. On the night before his installation, a copy of verses was affixed to the door of St. Patrick's cathedral, containing these amongst other lines:—

"This place he got by wit and rhyme,
And other ways most odd;
And might a bishop be,—in time,
Did he believe in God."

. . . .

"Look down, St. Patrick, look, we pray,
On this thy church and steeple;
Convert thy dean on this great day,
Or else, God help the people!"

This reputation for unbelief was acquired through the publication of *The Tale of a Tub* (1704), in which Swift employed the unequalled resources of his scornful wit in satirizing the extreme parties, the consistent doctrines, which the Revolution had discomfited. In the celebrated apologue of Peter, Martin, and Jack (by whom we may either understand Catholicism, Lutheranism, and Calvinism, or the Church of Rome, that of England, and the Puritans), it is hard to say whether the assault on Peter's knavery and mendacity, or on Jack's fanatical folly, be the more unsparing. Of Martin, who represents rational religion, moderation, common-sense,—in a word, the compromise,—Swift has only expressions of approval. But we know that what men *feel* to be a compromise, they cannot heartily love; and it is therefore only in conformity with what we should expect, to find that for every page given to the commendation of Martin, at least twenty are employed in reviling Peter or ridiculing Jack. Hence the general effect of the work as a whole is that of an attack on Christianity; and on this account its perusal was much recommended by Voltaire.

But there were other upholders of "the compromise" who had nothing of Swift's cynical temper, nay, who were conspicuously warm-hearted, eager, and generous. Such a man was the Irishman Richard Steele. He seems to have been descended from one of those Cromwellian adventurers who were rewarded for their services to the Puritan Commonwealth by grants of land at the expense of the Irish. It was natural, therefore, that his political sympathies should be of an Orange hue, and that he should regard William III. as the greatest of deliverers, the most beneficent of conquerors. For, but for the battle of the Boyne, it cannot be doubted that the confiscations of previous reigns would have been in great measure reversed, and the native Irish resettled on their own soil; in which case families of English origin and of recent importation, like that of Steele, would have fared but badly. Hence, in his *Christian Hero* (1701), written while he was in the army, and again in the *Tatler*, Steele launches forth into glowing panegyrics on his Dutch hero, which would have satisfied Lord Macaulay himself. The foundations being secure, Steele, whose education was English (he was at the Charterhouse and at Oxford along with Addison), employed his voluble argumentative tongue and his racy Hibernian humor to improve the superstructure. Mild reasoning, gentle ridicule, harmless banter, might, he thought, be used with effect to assuage the rancor of old animosities, soften the asperity of party spirit, expose the weak side of vanity, and introduce a temper of "sweet reasonableness" into all social relations. Availing himself of the advantages which his position as conductor of the *Government Gazette* gave him for obtaining early news, Steele started the *Tatler* in 1709, with the view of entertaining with instructive and amusing gossip the readers whom the promise of news from the seat of war had already attracted. The imaginary editor, Isaac Bickerstaff (the name was borrowed from Swift, who had employed it in his ironical controversy with Partridge the almanac-maker), dates his communications from various coffee-houses according to their subject matter. Addison, who was at the time in Ireland, soon discovered the authorship of the *Tatler*, and was enlisted with joy by Steele as a contributor. It was succeeded by the *Spectator* (1711–1713), planned by the two friends in concert, with the same general objects as the *Tatler*, but with better machinery. Almost at the opening, in No. 3, Addison wrote a clever vindication of the revolution-compromise, which the Jacobite leanings of some among the ministry appeared at the time to place in jeopardy. With this exception, political questions are scarcely mentioned by the *Spectator*, who in his character of a mild censor of manners, "pietate gravis ac meritis," affects to stand aloof from the strife of party, and by expostulation and advice undertakes to reform society. "The *Tatler* and *Spectator* were published," says Dr. Johnson, "at a time when two parties, loud, restless, and violent, each with plausible declarations, and each perhaps without any distinct termination of its views, were agitating the nation; to minds heated with political contest they supplied cooler and more inoffensive reflections: and it is said by Addison . . . that they had a perceptible influence upon the conversation of that time, and taught the frolic and the gay to unite merriment with decency."

Steele.

The Spectator.

By turning to fresh intellectual fields the minds of the upper classes—the people in good society—to whom the theatre was now a forbidden or despised excitement, Addison and Steele did without doubt allay much restlessness, still or amuse many feverish longings. Its ideals discredited or found impracticable, the English mind, disenchanted and in heavy cheer, took up with languid interest these pleasant chatty discoursings about things in general, and allowed itself to be amused, and half forgot its spiritual perplexities. Nothing was settled by these papers, nothing really probed to the bottom; but they taught, with much light grace and humor, lessons of good sense and mutual tolerance; and their popularity proved that the lesson was relished. The characterization which we meet with in the *Spectator* has been justly admired. Sir Roger de Coverley is an excellent type of the English country gentleman of that day—unintelligent and full of prejudices, but manly, open-hearted, and conscientious. The mercantile classes are represented, less adequately, yet in a dignified and attractive manner, by Sir Andrew Freeport. Captain Sentry, as the representative of the army, is not so satisfactory; compare him with Uncle Toby and Corporal Trim in Sterne's *Tristram Shandy* and the contrast between a dull, wooden figure, and personages who bring the life of the British army in Flanders exactly and vividly before our eyes, is immediately apparent.

English Deists.

The theological controversies of the period were carried on chiefly between deists and churchmen on the one hand, and non-jurors and oath-takers on the other. There will always be able men to whom revealed religion will not commend itself, because demonstration of its truth is in the nature of things impossible, and the portal through which conviction must be reached is too lowly for many to enter. In this age of reasoning, the English writers who followed Hobbes in eliminating the supernatural from Christianity considered it to be their duty to exhibit their proofs in the clearest and most systematic manner. Thus arose the school of English deists. Toland, the author of a good life of Milton, led the way with *Christianity not Mysterious* (1702). Tindal followed with *Christianity as old as the Creation*, in which an attempt is made to identify Christ with Crishna, and to evaporate the Christian religion into a solar myth. Collins, in his *Discourse on Free-Thinking*, took the line of impugning the trustworthiness of the text of Scripture. He was answered by Dr. Richard Bentley in a tract called *Phileleutherus Lipsiensis*, in which it is maintained that the text of the Greek Testament is on the whole in a sounder state than that of any of the Greek classical authors. Berkeley combated free-thinking in the philosophical dialogue of *Alciphron*. Bishop Butler, and afterwards Warburton, contributed important works to the same controversy.

Shaftesbury.

In philosophy the trains of thought which Hobbes and Leibnitz had pursued were either further developed, or led to opposing reactions. Hobbes's selfish theory of morals, and his disposition to leave out the idea of God from his system of the universe, found resolute opponents, not only in Clarke and Berkeley, but also in Shaftesbury, the noble author of the *Characteristics*. The treatises composing this work were published at various times between 1708 and 1713. Shaftesbury maintains the disinterested theory of morals, but rather in a rhetorical way than with much solidity of argument; he derives virtue, beneficence, and compassion, not, as Hobbes had in each case done, from a source tainted by self-interest, but from the delight which the mind naturally takes in actions and feelings conformable to its own unperverted nature. In his general reasonings on the constitution of nature and of man, Shaftesbury is an optimist; but his optimism acquires its serenity at the cost of surrendering the distinction between good and evil, virtue and vice. Like Pope (who, indeed, in the *Essay on Man*, versified and condensed freely the glowing rhetoric of the *Characteristics*), Shaftesbury

> "Accounts for moral as for natural things :"

the Deity whom he celebrates in eloquent periods is not a being who hates moral evil while permitting it, but one from whose elevated point of view that which seems to us worthy of reprobation must appear as necessary to the working out of a vast scheme of paternal government. These views bear a considerable resemblance to the hypothesis more cautiously put forward by the late Professor Mansell, and at once combated by Mr. Mill and Professor Goldwin Smith, which suggested that man's ideas of justice and injustice, right and wrong, were perhaps entirely different in kind from those which existed in the mind of God. It is obvious that the Supreme Being of the *Characteristics*, in whose eyes the excesses of the Reign of Terror would be merely a hurricane purifying the moral atmosphere, and who would see "with equal eye"

> "A hero perish or a sparrow fall"—

has little in common with the God of the New Testament, whose absolute rejection of iniquity is the very basis on which revealed religion is built, and in whose eyes the least of his reasonable creatures is "of more value than many sparrows." This dissonance between Christianity and his own system was evident to Shaftesbury himself, and led him to speak disrespectfully of the former in various places of his writings. He is accordingly classed by Leland among deistical writers. Pope, less clear-sighted, would not admit that the philosophy of the *Essay on Man* (which is precisely the same as that of Shaftesbury) was in any way repugnant to Christianity; and Warburton argued laboriously on the same side. Nevertheless, in his *Universal Prayer*, Pope implicitly retracted the main tenet of the longer poem; and posterity has held that Crousaz, the assailant of the *Essay*, understood its real bearing better than Warburton its defender.

Berkeley.

Disturbed at the thought of the predominance which the spread of Locke's sensationalist philosophy might be expected to give to the material interests of man, yet not choosing to revert to any of the old systems which let in the principle of authority, Berkeley conceived the strange idea of denying the validity of the inferences made by every perceiving mind concerning the objects perceived. He denied the existence of matter, or material substance, which is merely the name given by philosophers to the "something" which underlies and supports the sensible qualities of an object. The objects themselves, he admitted, are real; the ideas which the mind forms concerning them are also real; moreover, these ideas constitute for man the sole road to the knowledge of the objects. Instead of holding with Locke that the objects, by the impressions which they make on the senses, engender ideas, he held that the ideas implanted by the Creator in the human mind teach it all that it can possibly know about the objects. This ideal philosophy, having a merely subjective base—growing out neither of tradition nor experience—might obviously be twisted to the vindication of any system of opinions whatever. Hume, therefore, as we shall see in the next section, had not much difficulty in reducing it *ad absurdum*, by developing further the sceptical theory from which it started.

Defoe.

In France and Spain, Lesage and Lazarillo de Tormes had already won laurels by writing humorous tales of fiction in prose. Defoe, with us, was the first of a series in which he has had so many brilliant successors, by composing *Robinson Crusoe* (1719). Many other fictitious tales, in all which he aimed at the appearance of being a truthful narrator of facts, followed from the same facile pen. But in the texture of these, as in the mind that produced them, there was something coarse and homely; they could not supplant for refined readers the high-flown romances of France. That was reserved for the sentimental novels of Richardson; *similia similibus curantur.*

IX. *The Triumph of Compromise*, 1729–1789.—In the early part of this period, Pope, who died in 1744, was still the great literary force; for most of the remainder of it, that honor belonged to Samuel Johnson. Nothing can more strongly demonstrate the vitality of the political principles which triumphed at the Revolution than the fact that both these great men, though in secret they abhorred the compromise, had no choice but to acquiesce in it. Pope, whose grounds of dislike were both religious and political, indemnified himself for his acquiescence by many a scornful gibe and bitter sarcasm levelled at the German family which had seated itself on the Stuart throne. Witness the mocking adulation of the opening lines of the epistle to Augustus (George II.), or the scathing satire with which he pursued the memory of Queen Caroline both in the *Dunciad* and the *Epilogue to the Satires*, though he knew, and even admitted in a note, that that princess in her last moments "manifested the utmost courage and resolution." Johnson, whose objection to the compromise was almost wholly political, was an arrant Jacobite in feeling to the end of his days. One of his earliest productions, the *Marmor Norfolciense*, is a clever and cutting Jacobite squib. Allusions in his satire of *London* (1738) show the same political color, and probably had much to do with the sympathizing approval which Pope expressed for the unknown poet, who, he said, would soon be *deterré*. And although, after he had accepted a pension from George III., he could not decently, as he smilingly admitted to Boswell, "drink King James's health in the wine that King George gave him the money to pay for," yet the old feeling lurked in his mind, and found violent expression in a recorded conversation as late as 1777. "He had this evening . . . a violent argument with Dr. Taylor as to the inclinations of the people of England at this time towards the royal family of Stuart. He grew so outrageous as to say that, 'if England were fairly polled, the present king would be sent away to-night, and his adherents hanged to-morrow.'"

But, in general, the compromise met with inward no less than outward assent on the part of all the leading minds of the nation, literary men and divines equally with statesmen. For the first part of the period, the resolute common sense of Walpole, and the moderate churchmanship of Warburton, accurately represented the English mind. The defect of a compromise is, as was said in the last section, that it does not kindle enthusiasm; under it politics and politicians are apt to grow dull and vapid. Such a state of things prevailed at the time of the rising of 1745, when the young Pretender was not very far from succeeding, from sheer inertness on the part of those concerned in upholding the Revolution settlement. Soon afterwards there was a change. Young men grew up, before whose eyes floated visions of an expanding empire; the rapid advance of the American colonies, the success of Englishmen in India, on both which fields France was then our rival, stimulated the genius of the elder Pitt, and furnished themes for the eloquence of Burke. Then the value of those principles of political liberty which had been consolidated at the revolution came to be understood. Through these Pitt achieved in the Seven Years' War his memorable triumph over the absolute monarchies of France and Spain; and at the Peace of Paris (1763) England stood at the greatest height of national glory which is recorded in her history. Yet the brilliant scene was soon overcast. A Toryism without ideas, which was but in fact the portion of Revolution-Whiggism which refused to move with the times, aided by the personal influence of a narrow-minded, illiberal king, got possession of the administration, and immediately everything went wrong. The American war succeeded, and neither the authority of Chatham nor the enlightenment of Burke and Wyndham could prevent its ending in disaster. Soon after the Peace of Versailles the younger Pitt, then a sincere Whig, came into power. He applied himself with great skill and industry to the work of binding firmly together that inheritance of empire,—still sufficiently ample,—which the peace had left us, when in the middle of his task he was suddenly confronted by the portentous outbreak of the French Revolution.

Adam Smith. This period witnessed the foundation of the science of political economy by Adam Smith, whose memorable *Inquiry into the Nature and Causes of the Wealth of Nations* appeared in 1776. It also produced several eminent historians and philosophers, of whose works some notice will be taken presently. In other departments of literature, after the death of Pope, it was but poorly distinguished. Gray will be long remembered for the beauty and melody of some of his pieces,—*the Elegy in a Country Churchyard*, the *Bard*, and the *Progress of Poesy*. In the elegant poems of Goldsmith occur passages of sentiment, *e.g.*, the famous lines "Ill fares the land," etc., which read like anticipations of Rousseau. The satires of Churchill, though vigorous and pointed, are founded upon no intelligible principle; they have no universal character, like those of Pope, nor do they represent any definite political or religious view; rather they are dictated by mere national prejudice (*e.g.*, the *Prophecy of Famine*, a tirade against the Scotch), or by vulgar partisanship,—the eternal animosity of the outs against the ins. The *Rosciad* was a satire upon a stage sunk so low as not to be worth satirizing. There is much sweetness and grace in the verses of Shenstone; they formed part of the intellectual food which nourished the strong soul of Burns. Collins's *Ode to the Passions*, so much praised by our grandfathers, is gradually passing out of ken. The *Night Thoughts* of Young demand our notice, as the work of a man of large intellectual capacity, though of ignoble character. His meditations, though they never pass into the mystical or transcendental stage, are just and edifying; in applying them he displays a rich sermonizing vein; but a flavor of cant hangs about his most ambitious efforts. Beattie's *Minstrel*, a poem in the Spenserian stanza, deserves a passing word of commendation; it unites manly dignity to refinement and delicacy of feeling. **Cowper.** Cowper, ever on the brink of insanity, resorted to literature in order to prevent his mind from preying on itself. An amiable piety makes his *Task*, a long moralizing poem in blank verse, attractive to many minds; from the mere literary point of view, it must be allowed to be a feeble production. As he gained more confidence in himself, he developed a curious sort of mild feline humor, which appears in the delightful ballad of *John Gilpin*, and in several shorter pieces. The strength which had been wanting all his life came to him near its close, and inspired him to write those stanzas of wondrous majesty and beauty which have the title of *The Castaway*;—unhappily it was the strength of spiritual despair.

Burns. Beyond the Tweed, as Johnson was sinking towards the grave, and when the voice of English poetry had almost ceased to sound, a man of genius was coming to maturity, whose direct and impassioned utterances, straight from the heart of nature, were to reduce the frigid imitators of Pope to their proper insignificance, to startle the dull worshippers of the conventional, and to prepare the English-speaking world for that general break-up of formulas which the tempest of the French Revolution was about to initiate. Robert Burns was a native force; no foreign literature moulded him, no influence of Continental thought either made or marred him. He had the education of a Scottish peasant, and his self-culture does not appear to have consisted in much more than reading Pope and Shenstone, the *Spectator*, Sterne's novels, and a few other popular books. His natural powers were of the finest and highest order. Truly writes his countryman, the late Professor Craik: "Burns's head was as strong as his heart; his natural sagacity, logical faculty, and judgment were of the first order; no man, of poetical or prosaic temperament, ever had a more substantial intellectual character." The man being such, and such the equipment with which education and circumstance had furnished him, we observe with interest that he came into serious collision, on becoming complete master of his powers, with the religious system,—that of the Presbyterian Kirk of Scotland,—in which he had been brought up. It neither awed, nor attracted, nor convinced him. He never wrote more powerfully, or with a more searching humor, than when employed in exposing the hypocrisy and fanaticism of certain of its ministers.[1] If he had friends among them, it was among the "Moderates," a party corresponding to the Broad Church clergy of the present day, whom their colleagues in the Presbyterian ministry regarded with undisguised abhorrence. Religion, therefore, established no control over him; and unhappily this splendid nature found no resource in philosophy, nor moral strength within, which could avail to save him from the tyranny of his passions. "Vina, Venus,"—two out of the three banes spoken of by the Roman epigrammatist,—undermined too soon that stalwart frame, and silvered that glorious head. He died in his thirty-seventh year in 1796, leaving behind him, besides a few longer pieces, more than 200 songs, among which may be found gems of pathos, melody, and beauty, which any nation might be proud to wear in its intellectual coronet.

The drama. In the history of the drama during this period, the most noteworthy feature is the return of Shakespeare to the stage, brought about, soon after the middle of the century, by the reverent zeal of Garrick. When Drury Lane theatre was opened in 1747, chiefly for the performance of Shakespeare's plays, Johnson wrote the celebrated Prologue which was delivered on the occasion, describing the great dramatist as "exhausting worlds and then imagining new," as spurning the "bounded reign" of real existence, and forcing time to "pant after him in vain." Comedy, no longer gross, had become commonplace. From this reproach the two admirable plays of Goldsmith, *She Stoops to Conquer* and *The Good-Natured Man*, temporarily freed it; nor could it be justly imputed during the period of Sheridan's connection with the stage, from 1775 to 1780. But the wit that blazes,—the fun that sparkles,—in the scenes of the *Rivals* and the *Critic*, are of no purely English growth. Sheridan's Irish birth and Celtic temperament must be largely credited with the brightness and permanent attractiveness of his plays.

Sheridan.

Prose fiction, which more and more came to supply that kind of intellectual distraction which had before been sought in the drama, and, aided by the printing press, to diffuse its blessings (if they are blessings) to strata of the population which the drama had never reached, was employed in this period by several writers of rare ability. Fielding's *Tom Jones* and *Amelia*, Richardson's *Clarissa Harlowe* and *Sir Charles Grandison*, made the same kind of stir in general society that had been caused by Dryden's heroic plays some eighty years before. An ingenious French critic (Philarète Chasles) has attempted to trace in the works of these writers the conflict, though much transformed, of the Puritans and Cavaliers of an earlier age. Lovelace, he thinks, represents the insolent temper and disregard for morality of the aristocratic Cavaliers; Clarissa, his victim, the daughter of a virtuous middle class family, exhibits the substantial rectitude of that "good old cause," which licentious courts could persecute but could not subdue. Fielding, the aristocrat, recalls and continues the jovial recklessness of the men of the Restoration; Richardson, the plebeian, is in the line of Milton, Penn, Fox, Bunyan, and other witnesses. Yet these resemblances are after all superficial. It is true that Fielding cannot help writing like a gentleman, and a member of an ancient house; while Richardson, though he is fond of giving titles to his characters, betrays perhaps by his *seriousness* his breeding among the upper and most respectable classes of the proletariate. But when we look more closely, we find that both Fielding and Richardson adhere firmly to the Revolution-compromise, both in religion and politics,—and the one quite as much as the other. Fielding is as zealous a Protestant as Bunyan or Baxter; and the doctrine of non-resistance was rejected by him as warmly as by the Whig prosecutors of Sacheverell. Richardson, again, is neither a republican nor a nonconformist. He finds no objection, on the score of tolerance and latitude, to the church of Burnet, Tillotson, and Hoadly; and the hereditary presidency which the Act of Settlement had vested in the Hanoverian family was too feeble and inoffensive to excite in the breast of the most zealous of Whigs fears of the preponderance of the regal power in the constitution. Both Richardson and Fielding are entirely satisfied with the political and religious constitution of the land they live in. Dismissing such fancies, let us consider what were the actual occasions which led to the production of *Pamela* and the novels which followed it, and in what relation they stand to preceding literary work. They were in the main at once the symptoms and the developing causes of a reaction against the sentimental romances with which ladies and gentlemen had stuffed their heads and beguiled their time in the 17th and in the early part of the 18th century. A list of the chief works of this kind of literature is to be found in Addison's amusing paper on Leonora's library (*Spectator*, No. 37); it includes Sidney's *Arcadia*, the *Grand Cyrus*, *Cassandra*, *Pharamond*, *Cleopatra*, etc., the works named being all translations from the French romances of Scudery and Calprenède. The excessive popularity of this kind of reading is intimated by Addison when he says (No. 92), adverting to letters which he has received in relation to his project of forming a perfect "lady's library," that he has been "advised to place *Pharamond* at the head of his catalogue, and, if he thinks proper, to give the second place to *Cassandra*." In the character of Leonora herself, Addison mildly ridicules the sentimentality, affectation, and unreality which such reading, carried to excess, engenders.

---

[1] "Holy Willie's Prayer," "The Holy Fair," etc.

Richardson.

Richardson, whose father was a Derbyshire joiner, and who was brought up to the trade of a printer, in which he persevered all his life and prospered, had reached his fiftieth year when he was requested by two London booksellers to write for publication a series of *Familiar Letters*, for the instruction of persons who did not know how to express themselves properly in writing about the ordinary affairs of life. He consented, but proposed to give a moral and improving turn to the instruction to be communicated; to this the booksellers at once agreed. While he was writing model letters giving advice to young women going out to service, the incidents of a story which had come within his own experience occurred to his mind. It seemed to him that this story, if told by way of letters, "in an easy and natural manner, suitable to the simplicity of it, might possibly introduce a new species of writing that might turn young people into a course of reading different from the pomp and parade of romance writing, and, dismissing the improbable and marvellous, with which novels generally abound, might tend to promote the cause of religion and virtue." The heroine of his tale was a simple country girl, without book-learning, but strong in virtue and honesty of heart, to whom he gave the name *Pamela* (one of the two princesses in Sidney's *Arcadia*), as if to show that, to quote from Emerson, "the life of man is the true romance, which, if it be valiantly conducted, will yield the imagination a higher charm than any fiction." Pamela's virtue is assailed by the young libertine in whose house she is living as a servant; she resists him, and her "virtue" is "rewarded" (this is the second title of the book) by the honor and glory of marriage with this reprobate, who, being a fine gentleman, and stooping to a union with a "lass of low degree," atones for all past shortcomings by this amazing condescension. The book was well received; Pope, then declining towards the tomb, praised it as "likely to do more good than twenty volumes of sermons." There was, however, a strain of vulgarity in the manner in which the catastrophe of this romance of real life was narrated; and this defect was noted by the eagle eye of Fielding.

Fielding.

As a burlesque upon *Pamela*, he wrote (1742) the *Adventures of Joseph Andrews*. Joseph is a virtuous footman, who resists the improper advances of the titled lady in whose service he is; this of course was mere jest and caricature: in the end Joseph, instead of, like Pamela, marrying out of his condition, is wedded, as common sense would dictate, to a pretty, modest girl of his own rank. The bent of his own powers, and the suitableness of this new field for their employment, must have been revealed to Fielding while writing *Joseph Andrews*. Till now it had been his ambition to shine as a dramatist, and he had produced some plays of no inconsiderable merit; but soon after the appearance of his first novel he quitted the stage and gave up the remainder of his life, so far as it was not engrossed by the duties of a zealous police magistrate, partly to the production of essays on social topics, partly to novel-writing. *Tom Jones* (1749) is allowed to be his master-piece; it is one of the finest pieces of character-painting to be found in the whole range of literature. Yet it must be understood that Fielding's characters belong to a social medium from which the ideal and the heroic are shut out by the conditions of its existence; the "compromise" which England had accepted repressed enthusiasm and a high strain of virtue in every direction; no creations, therefore, possessing the immortal interest of some of those in *Don Quixote* could be expected from him who has been sometimes called the "English Cervantes." But taking them as they are, the characters of Tom Jones and Blifil, of Thwackum and Square, present us with inimitable types. Tom Jones, as the generous, manly youth, whom passion hurries into vice, but good feeling and innate rectitude never fail to rescue, is contrasted with the artful hypocrite Blifil, whose outward demeanor pays a homage to virtue which his secret practices and desires undo. Thwackum, the pedagogue, shows what comes of a pedantic learning which has nothing of the largeness of true culture; Square, the thinker, exhibits the moral decadence that results from a grovelling philosophy. In 1748 Richardson published *Clarissa Harlowe*, and in 1753 *Sir Charles Grandison;* both these novels are in the epistolary form. *Clarissa* soon obtained a European reputation, the sentimental metaphysics which constitute so large a portion of it being exactly to the taste of a large number of readers in France and Switzerland. Rousseau adopted the style, while corrupting the principles, of the English author, when he wrote his *Nouvelle Heloise*. The casuistry of love and seduction is interminable; so also is the novel of *Clarissa;* yet perhaps no reader who had launched fairly into it ever put the book down unfinished. It excites a deep tragic interest which no formal tragedy produced in England had awakened for several generations: the noble Clarissa, dying because she cannot brook a stain which yet touched not her will, nor came near her conscience, is a spectacle pathetic and touching in the extreme. The chivalrous, but provokingly perfect, Sir Charles Grandison was the character created by Richardson as a kind of contrast to, and compensation for, the aristocratic villain, Lovelace. His embarrassing situation between two lovely women who both adore him, and both of whom he loves, the English Harriet and the Italian Clementina,—though in the brief telling it seems absurd,—is managed in the novel with so much art and *vraisemblance* as to inspire the reader during seven volumes with a genuine perplexity and solicitude. His abrupt half-declaration to Harriet—"Honor forbids me; yet honor bids me;—yet I cannot be unjust, ungenerous, selfish!"—is a delicious *morceau* which can never fail to captivate, and fill with *attendrissement*, souls of sensibility.

Smollett.

After Richardson and Fielding came Smollett, with his *Roderick Random* and *Humphrey Clinker*, novels of coarser mould, and Sterne with *Tristram Shandy* and the *Sentimental Journey*. As works of humor, which contain also several admirable and minutely drawn pictures of character, the two last-named works, or at any rate *Tristram Shandy*, stand alone in our literature; but they are not in the proper sense of the term novels.

Sterne.

It is interesting to note that Sheridan borrowed some of his most popular characters from the novelists; Charles and Joseph Surface are evident copies of Tom Jones and Blifil; while Tabitha Bramble and Sir Ulic Mackilligut are no less manifestly the originals of Mrs. Malaprop and Sir Lucius O'Trigger. These are not the only resemblances; in fact *Humphrey Clinker* is the mine out of which Sheridan dug *The Rivals*. Nothing was more common, in the drama of the Elizabethan age, than for the playwrights to take their plots from novels. But in the present case we note a difference in the mode of procedure, which is a marked testimony to the increased relative importance of the novel. The Elizabethan dramatists borrowed only names and incidents; they created their characters. The Georgian dramatists often borrowed their characters ready-made from the pages of the novels, now glowing with a warmer life and richer coloring than their own. To the novels already mentioned Goldsmith's *Vicar of Wakefield* (1766) must be added,—the book which first drew Goethe's attention to English literature, and disclosed the hitherto unsuspected *idyllic* side of the existence of the good Protestant village pastor. To pass over inferior writers (Frances Burney, Henry Mackenzie, etc.), enough has been said to show that England, after the middle of the 18th century, obtained a school of novel-writers of her own, and shook herself free from the trammels alike of French classicism and French romanticism; nor have the able writers who then came into prominence ever wanted worthy successors down to the present day.

History.

Hume.

Gibbon.

The luminous intellect of Voltaire had, in the *Essai sur les Mœurs*, cast a fresh light on history, which was soon reflected in the writings of English students in this field. In the preface to the *Essai*, Voltaire said that the question was no longer to inform the world "in what year a prince who did not deserve to be remembered succeeded another barbarian like himself, in the midst of a rude and coarse nation." Henceforth it would be the business of a historian to seek out, amidst the throng of recorded events, "that which deserves to be known by us,—the spirit, the manners, the usages of the principal nations." Not believing in Christianity, and looking to intellectual and literary culture as the great means of human progress, Voltaire naturally regarded the history of the first ten centuries of our era as "no more deserving of being known than the history of the wolves and the bears;" feudalism and the Middle Ages filled him with disgust; it was only when he came to the Renaissance, with its revival of learning, its tolerance of theological differences, and its love of polish, that he seemed to find anything worth writing a history about. Hume, composing a *History of England* (1754) under the influence of ideas not very dissimilar to those of Voltaire, and commencing with the Stuart period, was not likely to write favorably of the Puritans, who were neither tolerant nor polished. His work accordingly gave much offence to the Whig party, which had inherited the political traditions of Puritanism. Robertson's historical pictures,—of Scotland, of Charles V., and of the settlement of America,—did not, except incidentally, go back beyond the period of the Renaissance; the actions of men who lived before that age seemed to him scarcely on a par with the "dignity of history." Gibbon's great work, the *Decline and Fall of the Roman Empire*, is designed to trace the gradual political debilitation of the empire, and the extinction of letters and arts through the ravages of the barbarians; thence passing with a firm and vigorous step through the long night of barbarism he dilates with eloquence and delight on the story of the rekindling of the flame of learning, and the renewed appreciation of beauty and refinement, which characterized the Italian Renaissance of the 14th and 15th centuries. We see that the historians of the 18th century, our own among the number, regarded the early and middle ages of our era as the province of the antiquary and the annalist rather than the historian proper,—who, if he dealt with them at all, should despatch them in brief summaries, in which, assuming an air of great superiority, he should try the men of the 9th or any other early century by the prevalent ideas of the eighteenth. Obviously, in the age in which we live, we have "changed all that;" the age of the Renaissance no longer presents itself to our eyes with such an overpowering lustre; and research into the motives and cast of thought of a Charlemagne or a Henry II. seems to us no longer beneath the "dignity of history."

Butler.

In theology, one very remarkable work belongs to this period,—Butler's *Analogy of Religion to the Constitution and Course of Nature* (1736). This is an apologetic work, and may perhaps be regarded as the last word in the deistical controversy. Butler, whose caution and fairness of mind are truly admirable, and who does not pretend that the inquiry which he institutes leads to more than *probable* conclusions, argues in this work that it is just as difficult to believe nature to have proceeded from and to be ruled by God, as to admit that Christianity has a divine origin. This line of reasoning, though cogent as against the deists, most of whom admitted a divine author of nature, is obviously insufficient to meet the scepticism of the present day, which, embracing the theory of evolution, either rejects the belief in a First Cause altogether, or declines to examine it, as lying beyond the scope of the human faculties. The *Sermons* of Bishop Butler, in which he established against Hobbes the fact of the existence in the human mind of disinterested affections and dispositions pointing to the good of others, belongs rather to the department of philosophy than that of theology.

Philosophy.

The philosophical speculations of this period may be described as a series of oscillations round Locke's *Essay of the Human Understanding*,—Hume taking Locke's principles, and turning them into a theory of scepticism; Hutcheson starting the theory of a new "sense" never dreamed of before, the moral sense; Hartley and Priestley developing Locke's sensationalism into materialism; while the Scotch school (Reid, Beattie, Dugald Stewart), recoiling from the consequences of Locke's system, attempted to smuggle "innate ideas" back into philosophy under the names of "common sense," "instinctive judgments," "irresistible beliefs," and so forth. Such brief examination of these writers as our limits allow will make our meaning clearer.

Hutcheson.

Locke's system, says Dugald Stewart,[1] in making sensation and reflection the sources of all our simple ideas, led him "to some dangerous opinions concerning the nature of moral distinctions, which he seems to have considered as the offspring of education and fashion." How Berkeley combated the tendencies of Locke's principles we have already seen. Hutcheson, an Irishman of great acuteness, who was appointed to a philosophical chair at Glasgow in 1729, unwilling to admit that our moral ideas had no other ultimate source than sensation, yet wishing to conform as much as possible to Locke's terminology, referred the "origin of our moral ideas to a particular power of perception, to which he gave the name of the moral sense."[2] But this was to use the word "sense" in a different meaning from what it had ever borne before; inasmuch as the objects of this so-called sense, being the qualities of moral actions, must be of necessity incorporeal, intangible, and imperceptible, and, as such, totally unlike the objects of the faculties commonly called senses, viz., sights, sounds, smells, tastes, etc. Nor was anything gained for the independence and immutability of morality; for it was argued by commentators on Hutcheson that, if the moral faculty were a "sense," then the qualities perceived by it, like the secondary qualities of material objects perceived by sensation and reflection, must be understood as subjective not objective, as existing in and for the perceiving mind alone, and not inherent in the actions themselves, which would thus become colorless and neutral, *i.e.*, destitute of moral character.

Hume.

A return upon scepticism was a frequent incident in the history of the Greek schools of thought, especially when the principles of opposing systems had been put forth with unusual warmth, and their supporters had found reconciliation and the explanation of differences out of the question. An example of this, in the history of English thought, is furnished by the case of Hume. Provoked by the extravagant paradoxes of Berkeley, who had ecclesiastical and professional reasons for trying to convince men that material objects had no reality,—mind was everything,—since the mystical and unnatural state of mind so engendered would favor the reception of any theology the philosopher might afterwards desire to implant,—Hume undertook to prove that mind had no real existence any more than matter, or that, if it had, such existence could not be proved. When I talk of "my mind," he said, how do I know that there is anything really existent which corresponds to the words? By the impressions and sensations of which I am conscious? But these only prove themselves; no one of course denies them; I only deny, at least I say you cannot prove, the existence of an entity in which these impressions inhere, and to which you give the name of "mind." If there was no flaw in such reasoning, philosophy was brought to a stand, and no certainty of any kind was attainable by the human faculties.

---

[1] *Outlines of Moral Philosophy*, ed. by McCosh, p. 49.
[2] Dugald Stewart.

Before the Scotch school and the great Immanuel Kant appeared to challenge these conclusions, David Hartley, in his *Observations on Man* (1749), espoused the tenets of Locke, and applied all his ingenuity to explaining the origin of as much of our knowledge as he could with any plausibility so treat, by referring it to the physical principle of the "association of ideas."

Reid.

Kant.

Dugald Stewart.

In the treatise already referred to, Hume declares that he does not wish to undermine or even to combat any man's belief; his aim was only to demolish bad logic, to expose the emptiness of alleged proofs of the divine government which were no proofs at all, and to make men see that "belief is more properly an act of the sensitive than of the cogitative part of our nature." The line of thought suggested by this and similar expressions appears to have been taken up and eagerly pursued by Reid, who, in his *Inquiry into the Human Mind upon the Principles of Common Sense* (1764), maintains that a large, and not the least important part of our knowledge is acquired, not, as Locke asserted, through sensation and reflection, but by means of immediate and instinctive judgments, in forming which the *common sense* of all mankind is at one. The moral faculty, according to Reid, judges of right and wrong in this instinctive way; it is a branch of common sense. Beattie, who was a better poet than he was a philosopher, pushed Reid's theory to an extreme which bordered on the ridiculous, including among the "irresistible" and "necessary" beliefs of the human mind a number of notions which are really of a historic and derivative character. Dr. Priestley, the discoverer of oxygen, adopting the system of Locke as a basis, wrote on *Matter and Spirit*, criticised the philosophy of Reid, and discussed the tenet of philosophical necessity; a strong materialistic bias pervades his writings. A greater thinker than any that Europe had witnessed since Descartes now arose in Germany. This was Kant, whose ambition it was to put a period to the desolating prevalence of scepticism and deliver philosophy from the instability and uncertainty by which it had been long beset. His *Critique of the Pure Reason* appeared about 1781. Against Locke, he showed that the mind can form neither conceptions nor judgments without the pre-existence in the thought of the absolute and universal ideas of time, space, unity, cause, being, etc.,—which ideas proceed from the intelligence itself, without any action being exerted on the organs of sensation. They are a *priori*, that is, prior to sensible experience; they belong to the pure reason, and may be regarded as the forms of our knowledge,—forms which the understanding applies to the material furnished by perceptions. He does not, however, allow that these ideas, though a *priori*, have any objective character; and for this metaphysical subjectivism he has been strenuously assailed by the Platonizing and orthodox schools of the present day. Against the materialists he maintains, in the *Critique of the Practical Reason*, that the "moral motive," or principle, which the intelligence (called in this aspect the practical reason) furnishes us with for the direction of our will, is immutable,—absolute,—necessary,—given a *priori* by the reason, and presenting to us the supreme and universal good as the final end of our existence, our desires, and our efforts. This motive is *duty*, or the moral obligation imposed on the human will by a power above it, which, consequently, is not man himself. To the knowledge, therefore, derived from the practical reason, Kant ascribes an *objective* character, which, as we saw, he denied to the forms of the pure reason. This law of duty supposes liberty in man as the very condition of the obligation which it imposes on him. Here of course Kant is at variance with the necessitarians and materialists. There being a necessary connection between virtue, *i.e.*, the obedience to duty, and the supreme good which it seeks, yet this connection being only partially realizable in this life, Kant infers the reality of a future life and the immortality of the soul. And, in view of our powerlessness to bring about this harmony between happiness and virtue, he infers the existence of a First Cause, infinitely powerful, just, and wise, which will establish it hereafter. The colossal system of Kant was known to Dugald Stewart (whose first work, *Outlines of Moral Philosophy*, appeared in 1793), but only through the medium of an imperfect Latin translation; from this cause, probably, he is thought to have failed to do full justice to it. Dugald Stewart, who was appointed to the chair of moral philosophy at Edinburgh in 1785, was the master of a clear and charming style, which made his lectures the delight of a large circle of pupils. Among these were numbered not a few in the spheres both of thought and action, who have left their mark on the age and the society to which they belonged,—Brougham, Lord Palmerston, Lord Russell, Francis Horner, Lord Lansdowne, Jeffrey, Sir Walter Scott, Sydney Smith, James Mill, Alison the historian, and Dr. Chalmers,—a varied and brilliant auditory for one professor to have lectured to and influenced in his day. One of the most interesting of Stewart's numerous works is his *Dissertation concerning the Progress of Metaphysical, Ethical, and Political Philosophy since the Revival of Letters in Europe.* In his *Outlines* (the work above mentioned) he argued, keeping generally to the lines of Butler and Hutcheson, that there is a moral faculty in man, that it is guided by duty not by interest, and that these two are not in the present state of the world identical, nor are the feelings that are inspired by actions prompted by the one the same as those which are suggested by actions prompted by the other. Right and wrong, he thinks, must be held to be intrinsic qualities of actions, and not merely modes of the mind observing those actions. Everywhere he is firm and explicit on the immutability of moral distinctions. In fact, in its general outcome his ethical philosophy resembles pretty closely that of Kant; but it is not thought out with the same rigor of logic, nor founded on as searching a psychological analysis, nor expressed in as exact a terminology, as belong to the writings of the philosopher of Königsberg.

X. *The French Revolution*, 1789–1832.—Probably there was not a single gifted mind in any country of Europe upon which the tempest of the French Revolution did not come with a stimulating or disturbing influence. Young men—hasty counsellors ever, from the days of Rehoboam,—thrilled with hope and flushed with excitement, announced and believed that a golden age had opened for mankind. Wordsworth hastened from Cambridge in 1792 to France, where he lived more than a year, and formed some Girondist acquaintances; Coleridge invented a scheme for an ideal community which was to form a model settlement, to be conducted on principles of pantisocracy, on the banks of the Susquehanna; Southey nearly got himself into trouble by publishing *Wat Tyler*, a dramatic sketch of an inflammatory and seditious character. On the other hand, the young Walter Scott looked with shrewd, clear eyes on the tumultuous scene, and was not tempted to throw himself into the vortex: for him the treasures of Europe's mighty past were real and precious, and not to be bartered for any quantity of visionary hopes and fairy gold. Soon the proceedings of the Revolutionists made it clear enough that human nature and human motives were not changed; and the ranks of reaction were rapidly filled. In England an immense effect was produced by the appearance of Burke's *Reflections on the French Revolution* in 1791. The sympathizers with the French republicans dwindled in number so fast, that at the end of the century, as it was sportively said, the whole of the opposition to Pitt's Government in the House of Lords went home from the debate in a single hack cab. Wordsworth, Southey, and Coleridge changed round to the Conservative side. The appearance in France of the *Génie du Christianisme* (1802) by Chateaubriand marked the commencement of the great continental reaction. The public policy of England became essentially conservative; she endeavored to prop up all the old monarchies on the Continent, whether they deserved to live or not; she harbored thousands of French priests; she supported the temporal power of the pope. A remarkable dissonance hence arose between the policy of the country and some of the finest notes in its literature. While the English aristocracy was putting forth its full strength to combat Jacobinism by land and sea, the spirit of revolution breathed from the pages of Shelley and Byron. The war with Napoleon was waged with the approval of the great majority of the nation; but the able critics and publicists who conducted the *Edinburgh Review* (started in 1802) were vehemently opposed to it, and would, if their influence had prevailed, have withdrawn the sword of England from the contest at least ten years before Waterloo.

Scott.

Byron.

The romantic poems of Scott (*Lay of the Last Minstrel*, *Marmion*, *Lady of the Lake*, etc.) were popular because they were in sympathy with the return (now strongly pronounced) of the European mind towards chivalry, feudalism, and the mediæval spirit. The works of the Renaissance were no longer praised; its art was held to be imitative or debased, its refinement to be superficial, its enthusiasm factitious. Taking its cue from Rousseau, all the world was thirsting, or pretending to thirst, after nature and simplicity; the *naïveté* and spontaneity, real or imagined, of the "ages of faith" seemed incalculably better than the *finesse* and self-consciousness of modern times. Working this vein somewhat too long, Scott was at last outshone in it by Byron, whose romantic tales (*Bride of Abydos*, *The Corsair*, *The Giaour*, etc.) were still more remote from the dulness and conventionality of ordinary life than those of Scott. In *Childe Harold*, a poem finely but unequally versified in the Spenserian stanza, the noble poet described himself,—for no one ever doubted that he was himself "the great sublime he drew,"—travelling through Spain, Italy, and Greece, a prey to melancholy discontent, brooding over the perishing relics of departed greatness, but unable to utter any formula potent for its re-creation other than vague cries for the bursting of all fetters which repress the spirit or the limbs of men. The increasing moral disorder of Byron's mind is marked by the appearance of *Don Juan*, a long rambling poem, written after his wife had left him, and he had gone to the Continent in 1816, never to return. In 1823 he joined the Greek insurgents who had taken arms to throw off the Turkish yoke. He landed at Missolonghi, spent large sums of money, but effected nothing of importance; and in April, 1824, he was cut off by a fever.

Shelley.

Shelley is a striking illustration of the influence which the revolutionary literature of that age possessed in moulding or modifying human character. His own earliest recollections dated to a time when all ranks of English society were animated by feelings of horror and detestation at the French "Terror," and in no mood to embrace any revolutionary sentiment, or even give a hearing to any novel opinion. Yet the mind of Shelley —nursed upon the sceptical suggestions of Hume, the utopian speculations of Godwin, and the antinomian dreams of Rousseau, and pushing to extremes, from the fervor of a nature in which prudence and diffidence found no place, all that he read,—was in a state of high revolt, even in his college days, against all that was held sacred by other men. Sent away from Oxford, he fell in with the bright high-spirited Harriet Westbrook, and induced her to marry him. But all bonds, including those of matrimony, which fettered the free inclinations of the mind, Shelley had taught himself to regard as a tyranny to be withstood. He grew tired of Harriet, formed a connection of free love with Mary Godwin, and deserted his hapless wife, who, two years afterwards, committed suicide. Whether Shelley would ever have brought his wild actions and wilder thoughts under any discipline it is impossible to tell, for he was cut off by a sudden and early death. His poems display the most perfect and wonderful mastery of the resources of the English language for the purposes of imaginative expression that has ever been attained to among our poets. As Pope and Dryden gave us logic in metre, so Byron and Shelley gave us rhetoric in metre. Splendid pieces of declamation may be found in the *Childe Harold* and "Isles of Greece" of the one poet, and in the *Hellas* and *Revolt of Islam* of the other. The "Skylark," and some other poems, considered as creations of the pure imagination, have surely never been surpassed.

An accidental circumstance,—the finding of an old unfinished MS. in a forgotten nook of a cabinet,—turned Sir Walter Scott into the path of prose fiction, in which his strong memory and inexhaustible imagination, joined with a gift for picturesque description, and the faculty, within certain limits, of creating and presenting living types of character, eminently qualified him to excel. Then was given to the world the long and splendid series of novels, commencing with *Waverley* and ending (when his mind had partially given way) with *Castle Dangerous*. We do not forget that a living French critic, whose admirable style makes even his paradoxes attractive, treats the Waverley Novels with little ceremony; they were taken, he says, for faithful copies of the antique world in Europe at a time when people knew no better; now we go to the original sources of information, and find that he distorts everything. But, in the first place, so far as the Waverley Novels consist of the skilful evolution of plots invented by the author, and of the contrasted play of characters created by him,—and not of historical pictures,—this criticism does not touch them at all. In *Peveril of the Peak*, for instance, where a peculiar zest attaches itself to the love of Julian Peveril for Alice Bridgenorth on account of the political and religious differences which divide their fathers, though Scott might be proved to have omitted some important features in his historic sketch of the Restoration, still the deep attraction of the story would not lose its charm. So again, in *Ivanhoe*, although the repulsion between Saxon and Norman—the concrete picture of which, presented in this novel, so deeply impressed the historian Thierry—be to some extent an exaggeration of the feelings which actually prevailed between the two races under Richard I., yet neither does this inaccuracy affect the substantial truthfulness and instructiveness of the historic *tableau*, nor, if it did, would the tragic passages which describe the siege of the castle of Front-de-Bœuf exercise an inferior fascination. But, secondly, the real meaning of M. Taine's charge is, not that Scott has mis-read history, but that he has not read it from the special philosophical stand-point of M. Taine. He did not read it in the conviction of the relativity of all events, nor regard it simply as the evolution of the Welt-Geist, nor believe that human society, through the stages of theology and metaphysics, advances inevitably to the bourn of positive science. But it remains to be proved whether these views of history will not prove more ephemeral than the simpler conceptions which possessed the mind of Sir Walter Scott.

Edinburgh Review.

Reference was made above to the commencement of the *Edinburgh Review* in 1802. The tendencies of thought which distinguished its founders were of so remarkable a character,—exercised so marked an effect on the philosophy, the legislation, and even the literature of their times,—and are still so influential, that some attempt to analyze and describe them must be made. There were varieties of opinion among the writers for this celebrated review from the first; amongst them were mere Whigs and mere literary critics, but that which gave it a backbone was its being partially the organ of a party, known some years later by the name of "Philosophical Radicals." This school took its philosophy from Locke, Bentham, and Adam Smith. It held that the old systems which admitted the principle of authority were for ever ruined and discredited, that, as government was an affair of contract, so religion was an affair of evidence, and that, since the same evidence was estimated differently by different minds, the right course was, to confine religion within the domain of the individual conscience, tolerating all forms of it not anti-social, but giving political prominence to none. Coleridge, in an eloquent work published in 1829,[1] supported the theory of a national church, not as the channel for teaching religious truth, but as providing a machinery for diffusing culture and enlightenment, as well as teaching morality by example, through the length and breadth of the land. This view was too Platonic for the school we are now considering—which, however, did not attack the already existing established church, but contented itself with insisting that its clergy should be vigilantly controlled by the state, lest they should teach principles or practices inconsistent with the general good. Churches they regarded as decrepit and perishing institutions; it was the state which, in their eyes, flourished in immortal youth; and their hopes of future good were involved in the development of civilization under its auspices. They believed in the gradual advance and perfectibility of the race through the operation of wise institutions, furthering the free play of all the human faculties, while guaranteeing the order and stability of society. The happiness that would thence arise, consisting in the realization of "the greatest good of the greatest number," they regarded as the satisfaction of enthusiasm and the goal of effort. To political economy, that eminently *lay* study, and to the development of physical science, they looked for the measures and the means requisite for the attainment of this happiness. Moreover, since, from their point of view, there was nothing absolute in moral sanctions, it was ridiculous for a nation to hamper itself by adherence to engagements contracted by a former generation, on the plea of national honor, if such adherence was prejudicial to the interests of the living. Views of this kind, beginning even then to be propounded, drew from Burke the exclamation that the "age of chivalry was past," and that "that of sophists, economists, and calculators had succeeded." The study of social grievances, and of the means of removing them, assumed a prominent place among their objects, and gave rise to much laudable and beneficial activity. On humanitarian grounds they supported the agitation against slavery which Christian philanthropists like Clarkson and Wilberforce had commenced from a religious motive. Senior occupied himself with the evils of the old poor-law; Francis Horner became a great authority on finance; Sir Samuel Romilly took up the reform of our criminal jurisprudence; Ricardo, J. S. Mill, and M'Culloch studied the laws of the creation and distribution of wealth, and demonstrated the impolicy of restrictions on trade. The benefits of national education began to be seen and enforced; and Lancaster and Bell entered upon useful labors connected with the organization of schools and the supply of teachers. Harriet Martineau wrote popular tales, and Elliott "Corn-law rhymes" in order to indoctrinate the multitude with sound views on economical questions. In short, all the good was done or attempted which men starting from the basis of empirical philosophy could do or attempt; whatever was outside the range of that philosophy was neglected.

---

[1] *Constitution of Church and State.*

There is something rather saddening in the contemplation of the careers of most of the eminent literary men of this epoch. Byron and Shelley were cut off in the flower of their days; Southey's overtasked brain gave way some years before his death, and the same fate befell Ireland's gifted singer, Thomas Moore. Scott, ruined through too much haste to be rich, literally worked himself to death to clear off the mountain of liability which his implication in Ballantyne's failure had thrown upon him. Coleridge, though he lived to old age, had weakened a will originally irresolute, and shattered nerves originally over-sensitive, by the fatal practice of opium-eating; in the time of gray hairs he subsided into a dreamy talker about "sum-in-ject" and "om-in-ject."[1] Wordsworth alone preserved to the last an unimpaired sanity of mind and body, for which he might thank the simplicity and serenity of his life in Westmoreland, where he settled on his return from France. Rapt in profound meditation, he communed among the mountains with the spirit of the universe; and the beauty of the crag, the tarn, the flower, transmitted itself, through the lips of nature's poet-priest, into verse of wondrous melody. When the period of inspiration was past, he quietly conformed to the religion and politics of his neighbors, and wrote much in support of them; but these later works are pitched in a lower key.

Wordsworth.

Since the death of Scott, the power of literature, combined with journalism, has been continually on the rise. The novelists, while describing, have modified our social customs; the essayists have been instrumental in bringing about political reforms; the poets have stirred,—generally to thoughts and desires of change,—the impressible hearts of the young. The power of art over the human mind, and its influence in determining the aspects of life, have been, in all English-speaking countries, declining, while that of literature has been advancing. Whether this particular distribution of the master-influences that affect mankind will continue to prevail, or whether art is destined to regain among us a portion of its early power, and the sway of literature to be correspondingly restricted, is a question which the future must decide.

ENGRAMELLE, Marie Dominique Joseph, a distinguished French naturalist, whose work, *The Butterflies of Europe*, in eight volumes, and published between 1779 and 1793, forms an important and valuable contribution to science. He also obtained considerable note as a musician. Born in Artois in 1727; died in 1781.

Etymology.

ENGRAVING. The verb *engrave* is an old French word adopted by the English language, in which it bears at the present day but one signification, that of marking by incision. In old English the word was used in other senses, with which we need not now trouble the reader, and the verb *engraver* in modern French, used for a boat when she runs her keel into the beach or for a cart when its wheels stick in the mud of a road or the sand of a river, is a different word, being derived from *grève*, the sands of sea or river, which comes from the Provençal *grava*, the bed of a torrent, and is nearly related to the English *gravel*. Our English verb *to engrave* belongs to a large family of words in many Western languages, the Anglo-Saxon form *grafan* being remarkable for its similarity to the Greek *γράφειν*. Littré affirms that the Latin words *scribere* and *scrobs* are also etymologically related to the verb *graver*, and it is evident that there is a close connection between *scrobs*, a furrow, and the hollow cuttings produced by an engraver with his tools. The *grave* in which the dead are buried is also connected with these words both by its meaning and its etymology. The idea of a furrow or cutting is essential to engraving, much more essential than any artistic idea. The rudest mark which is cut into the substance of anything is really an engraving, whilst the most admirable drawing which does not cut into the surface is not engraving at all. When Old Mortality deepened the inscriptions on the tombstones of the Covenanters he was strictly doing engraver's work, though of a coarse kind. In like manner the peoples of remote antiquity who chiselled their writing and drawing on slabs of stone, were in the strictest sense engravers, though the connection between their rude performance and the refined workmanship which is bestowed on a modern vignette may not at first sight be very obvious. On the other hand, a lithograph is not an engraving, neither is a photograph, nor a photographic autotype; but the applications of photography which are known as *héliogravure* and *photogravure* are really engraving, because in these processes the surface of the metal plate is eaten into or lowered. For the same reason etching may be correctly included under the generic term engraving, and an etcher is called in French a *graveur à l'eauforte*, an engraver by means of acid.

Definition.

Engraving may then be defined as writing or drawing in which the marks are produced by removing a portion of the substance on which the writing or drawing is made, instead of by simply staining or discoloring it as ink and lead pencil do, or covering it with an opaque or transparent pigment as in oil-painting.

The idea of multiplication by printing, or by casting (as in seal engraving), is a mere accidental suggestion and not an essential part of the art. Engraving preceded printing, and is still much used without any connection with printing, as in the chased ornamentation of silver plate, firearms, jewelry, and other objects of luxury.

It is our intention, in the present article, to confine ourselves strictly to engraving as one of the fine arts. Its present position is almost universally secondary to painting. The engraver, in the fine arts, is almost invariably occupied in translating the works of painters, as by his intervention they can afterwards, at least in translation, be widely disseminated by the press.

Principal varieties of engraving.

There are several different varieties of engraving, the chief of which are—(1) Line engraving on metal plates, usually of copper or steel, in which the line is always incised; (2) Etching, usually on metal, in which the lines are corroded by means of acid; (3) Mezzotint, in which there are no lines whatever, but only shades produced by roughening the surface of the metal; and (4) Woodcut, in which the lines which print black have to be left in relief, whilst the surface round them is cut away.

These primary technical conditions have an irresistible influence even upon the mental qualities exhibited in the different kinds of engraving. Each kind is favorable to certain mental states, and unfavorable to others, each being in itself an artistic as well as a technical discipline. A line engraver will not see or think like an etcher, nor an etcher like an engraver in mezzotint; and the consequence of this difference is that the manner in which a line has to be cut has a great influence in determining the direction of artistic taste and feeling. Nor is this influence confined to the engravers themselves. The enormous multiplication of their work by printing makes engravers only second to writers in their power over public taste, which they can refine or vitiate by spreading refined or vulgar interpretations of pictures.

Engraving independent of painting.

There is no inherent reason why engraving should be used only to translate painting. The early engravers were often original artists who worked out designs of their own, but in course of time a commercial reason prevailed over originality. It was found that a well-known picture assured the sale of an engraving from it beforehand, whereas an engraving which stood entirely on its own merits came into the world without advantages, and had its own way to make. Besides this, the engraver who copied a picture saved himself all the trouble of thinking out and composing the design, which he found ready to his hand. The same reasons have prevailed against original etching in our own day. There has been a great revival of etching during the last fifteen or twenty years, especially on the Continent, and many artists have acquired very great skill in this mode of engraving. It was hoped, at first, that they would employ their skill upon original works, but the convenience, both of publishers and etchers, soon led them to employ etching, as engraving had been employed before, almost exclusively in translating pictures. We cannot but deplore this subordination of engraving to painting; and when we recur to the great engravers of past times who composed and invented their own works, it is with a feeling of regret that they have left so very few successors.

Although we mentioned the four chief kinds of engraving in the order of what is usually considered to be their relative importance, putting line engraving in the first place and woodcut in the last, this is not the chronological order of their discovery. Woodcut is the oldest kind of engraving from which impressions were printed, and must therefore be taken first in a paper of this kind, which proposes to deal only with engraving for the press.

Wood Engraving.

It is natural that wood engraving should have occurred first to the primitive mind, because the manner in which woodcuts are printed is the most obvious of all the kinds of printing. If a block of wood is inked with a greasy ink and then pressed on a piece of paper, the ink from the block will be transferred at once to the paper, on which we shall have a black patch exactly the size and shape of the inked surface. Now, suppose that the simple Chinese who first discovered this was ingenious enough to go a step further, it would evidently occur to him that if one of the elaborate signs, each of which in his own language stood for a word, were drawn upon the block of wood, in reverse, and then the whole of the white wood sufficiently cut away to leave the sign in relief, an image of it might be taken on the paper much more quickly than the sign could be copied with a camel-hair brush and Indian ink. No sooner had this experiment been tried and found to answer than block-printing was discovered, and from the printing of signs to the printing of rude images of things, exactly in the same manner, the step was so easy that it must have been made insensibly. Wood engraving, then, is really nothing but that primitive block-cutting which prepared for the printer the letters in relief now replaced by movable types, and the only difference between a delicate modern woodcut and the rude letters in the first printed books is a difference of artistic skill and knowledge. In Chinese and Japanese woodcuts we can still recognize traditions of treatment which come from the designing of their written characters. The main elements of a Chinese or a Japanese woodcut, uninfluenced by European example, are dashing or delicate outlines and markings of various thickness, exactly such as a clever writer with the brush would make with his Indian ink or vermilion. Often we get a perfectly black blot, exquisitely shaped and full of careful purpose, and these broad, vigorous blacks are quite in harmony with the kind of printing for which wood engraving is intended.

Origin of wood engraving.

It has not hitherto been satisfactorily ascertained whether wood engraving came to Europe from the East or was

The earliest European wood engraving.

rediscovered by some European artificer. The precise date of the first European woodcut is also a matter of doubt, but here we have certain data which at least set limits to the possibility of error. European wood engraving dates certainly from the first quarter of the 15th century. It used to be believed that a cut of St. Christopher, very rudely executed, and dated 1423, was the Adam of all our woodcuts, but subsequent investigations have shaken this theory. There is a cut in the Brussels library, of the Virgin and Child surrounded by four saints, which is dated 1418, but the composition is so very elegant and the drawing so refined and beautiful, that one has a difficulty in believing the date, though it is received as authentic. The Virgin and Child of the Paris library is without date, but is supposed, apparently with reason, to be earlier than either of the two we have mentioned; and M. Delaborde has proved that two cuts were printed in 1406. The Virgin and Child at Paris may be taken as a good representative specimen of very early European wood engraving. It is simple art, but not bad art. The forms are drawn in bold thick lines and the black blot is used with much effect in the hollows and recesses of the design. Beyond this there is no shading. Rude as the work is, the artist has expressed exquisite maternal tenderness in the pressure of the Virgin's cheek to that of the Child, whilst the attitude of the Child itself, with its foot in its hand and its arm round the mother's neck, is most true to nature, as is the pose of the other foot against the mother's arm, and also the baby-like bending and twisting of the legs. The Virgin is crowned, and stands against a niche-like decoration with pinnacles as often seen in illuminated manuscripts. In the woodcut this architectural decoration is boldly but effectively drawn. Here, then, we have real art already, art in which appeared both vigor of style and tenderness of feeling.

The criblé.

The very earliest wood engraving consisted of outlines and white spaces with smaller black spaces, but shading is rare or absent. Before passing to shaded woodcuts we may mention a kind of wood engraving practised in the middle of the 15th century by a French engraver, often called Bernard Milnet, though his name is a matter of doubt, and by other engravers nearer the beginning of that century. This method is called the *criblé*, a word for which there is no convenient translation in English. It means, *riddled with small holes*, as a target may be riddled with small shot. The effect of light and dark is produced in this kind of engraving by sinking a great number of round holes of different diameters in the substance of the wood, which, of course, all come white in the printing; it is, in short, a sort of stippling in white. When a more advanced kind of wood engraving had become prevalent the *criblé* was no longer used for general purposes, but it was retained for the grounds of decorative wood engraving, being used occasionally in borders for pages, in printers' marks, and other designs, which were survivals in black and white of the ancient art of illuminating. Curiously enough, this kind of wood engraving, though long disused for purposes of art, has of late years been revived with excellent effect for scientific purposes. It is now the accepted method of illustration for astronomical books. The black given by the untouched wooden block represents the night sky, and the holes, smaller or larger, represent in white the stars and planets of lesser or greater magnitude. The process is so perfectly adapted to this purpose, being so cheap, rapid, and simple, that it will probably never be superseded. The objections to it for artistic purposes are, however, so obvious that they were soon perceived even by the untrained critical faculty of the earlier workmen, who turned their attention to woodcut in simple black lines, including outline and shading.

Technical characteristics of early wood engraving.

In early work the outline is firm and very distinct, being thicker in line than the shading, and in the shading the lines are simple, without cross-hatchings, as the workmen found it easier and more natural to take out a white line-like space between two parallel or nearly parallel black lines than to cut out the twenty or thirty small white lozenges into which the same space would have been divided by cross-hatchings. The early work would also sometimes retain the simple black patch which we find in Japanese woodcuts; for example, in the Christmas Dancers of Wohlgemuth all the shoes are black patches, though there is no discrimination of local color in anything else. A precise parallel to this treatment is to be found in a Japanese woodcut of the Wild Boar and Hare given by Aimé Humbert in his book on Japan, in which the boar has a cap which is a perfectly black patch though all other local color is omitted. The similarity of method between Wohlgemuth and the Japanese artist is so close that they both take pleasure in drawing thin black lines at a little distance from the patch and following its shape like a border. In course of time, as wood engravers became more expert, they were not so careful to spare themselves trouble and pains, and then cross-hatchings were introduced, but at first more as a variety to relieve the eye than as a common method of shading. In the 16th century a simple kind of wood engraving reached such a high degree of perfection that the best work of that time has never been surpassed in its own way. We intend very shortly to render full justice to the highly developed skill of modern wood engravers; but it is undeniable that in the 16th century the art stood more on its own merits than it does now, respected itself more, and affirmed itself without imitating other arts.

Wood engraving in the 16th century.

Dürer's Salutation.

Holbein's Dance of Death.

Amman's handicrafts.

Baldung Grün.

Wood engraving in the 16th century was much more conventional than it is in the present day, and this very conventionalism enabled it to express what it had to express with greater decision and power. The wood engraver in those days was free from many difficult conditions which hamper his modern successor. He did not care in the least about aërial perspective, and nobody expected him to care about it; he did not trouble his mind about local color, but generally omitted it, sometimes, however, giving it here and there, but only when it suited his fancy. As for light-and-shade, he shaded only when he wanted to give relief, but never worked out anything like a studied and balanced effect of light-and-shade, nor did he feel any responsibility about the matter. What he really cared for, and generally attained, was a firm, clear, simple kind of drawing, conventional in its indifference to the mystery of nature and to the poetic sentiment which comes to us from that mystery, but by no means indifferent to fact of a decided and tangible kind. The wood engraving of the 16th century was a singularly positive art, as positive as carving; indeed most of the famous woodcuts of that time might be translated into carved panels without much loss of character. Their complete independence of pictorial conditions might be illustrated by many examples. In Dürer's Salutation the dark blue of the sky above the Alpine mountains is translated by dark shading, but so far is this piece of local color from being carried out in the rest of the composition that the important foreground figures, with their draperies, are shaded as if they were statues in plaster of Paris. Again, the sky itself is false in its shading, for it is without gradation, but the shading upon it has a purpose, which is to prevent the upper part of the composition from looking too empty, and the conventionalism of wood engraving was so accepted in those days that the artist could have recourse to this expedient in defiance alike of pictorial harmony and of natural truth. In Holbein's admirable series of small well-filled compositions, the Dance of Death, the firm and matter-of-fact drawing is accompanied by a sort of light-and-shade adopted simply for convenience, with as little reference to natural truth as might be expected in a stained-glass window. There is a most interesting series of little woodcuts drawn and engraved in the 16th century by J. Amman as illustrations of the different handicrafts and trades, and entitled The Baker, The Miller, The Butcher, and so on. Nothing is more striking in this valuable series than the remarkable closeness with which the artist observed everything in the nature of a hard fact, such as the shape of a hatchet or a spade; but he sees no mystery anywhere—he can draw leaves but not foliage, feathers but not plumage, locks but not hair, a hill but not a landscape. In the Witches' Kitchen, a woodcut by Baldung Grün of Strasburg, dated 1510, the steam rising from the pot is so hard that it has the appearance of two trunks of trees denuded of their bark, and makes a pendant in the composition to a real tree on the opposite side which does not look more substantial. The clouds of steam round about the jet are like puddings. Nor was this a personal deficiency in Baldung

Jacob Binck.

Grün. It was Dürer's own way of engraving clouds and vapor, and all the engravers of that time followed it. Their conceptions were much more those of a carver than those of a painter. Dürer actually did carve in high relief, and Grün's Witches' Kitchen might be carved in the same manner without loss; indeed it has the appearance of an *alto-rilievo* with the ground tinted darker than the carvings. When the engravers were rather draughtsmen than carvers, their drawing was of a decorative character. For example, in the magnificent portrait of Christian III. of Denmark by Jacob Binck, one of the very finest examples of old wood engraving, the face and beard are drawn with few lines and very powerfully, but the costume is treated strictly as decoration, the lines of the patterns being all given, with as little shading as possible and what shading there is, is simple, without cross-hatching.

Bewick.

Amman and Bewick.

White lines.

The perfection of simple wood engraving having been attained so early as the 16th century, the art became extremely productive, and has been so ever since. During the 17th and 18th centuries it still remained a comparatively severe and conventional form of art, because the workmen shaded as much as possible either with straight lines or simple curves, so that there was never much appearance of freedom. Modern wood engraving is quite a distinct art, being based on different principles, but between the two stands the work of an original genius, Bewick, who cannot be overlooked. He was born in 1753, and died in 1828. Although apprenticed to an engraver in 1767, he was never taught to draw, and got into ways and habits of his own which add to the originality of his work, though his defective training is always evident. His work is the more genuine from his habit of engraving his own designs, which left him perfect freedom of interpretation, but the genuineness of it is not only of the kind which comes from independence of spirit, it is due also to his fidelity to the technical nature of the process, a fidelity very rare in the art. The reader will remember that in wood engraving every cutting prints white, and every space left untouched prints black. Simple black lines are obtained by cutting out white lines or spaces between them, and crossed black lines have to be obtained by laboriously cutting out all the white lozenges between them. In Bewick's cuts white lines are abundant and are often crossed, but black lines are never crossed; he is also quite willing to utilize the black space, as the Japanese wood engravers and Dürer's master Wohlgemuth used to do. The side of the frying-pan in the vignette of the Cat and the Mouse is treated precisely on their principles, so precisely, indeed, that we have the line at the edge for a border. In the vignette of the Fisherman, at the end of the twentieth chapter of the *Memoir*, the space of dark shade under the bushes is left quite black, whilst the leaves and twigs, and the rod and line too, are all drawn in pure white lines. Bewick, indeed, was more careful in his adherence to the technical conditions of the art than any of the primitive woodcutters, except those who worked in *criblé*, and who used white lines as well as their dots. Such a thing as a fishing-net is an excellent test of this disposition. In the interesting series by J. Amman illustrating the crafts and trades of the 16th century, there is a cut of a man fishing in a river, from a small punt, with a net. The net comes dark against the light surface of the river, and Amman took the trouble to cut a white lozenge for every mesh. Bewick, in one of his vignettes, represents a fisherman mending his nets by the side of a stream. A long net is hung to dry on four upright sticks, but to avoid the trouble of cutting out the lozenges, Bewick artfully contrives his arrangement of light and shade so that the net shall be in light against a space of black shade under some bushes. This permits him to cut every string of the net in white, according to his practice of using the white line whenever he could. He used it with great ability in the scales of his fish, but this was simply from a regard to technical convenience, for when he engraved on metal he marked the scales of his fish by black lines. These may seem very trifling considerations to persons unacquainted with the fine arts, who may think that it can matter little whether a fishing-net is drawn in black lines or in white, but the fact is that the entire destiny of wood engraving has depended on preserving or rejecting the white line. Had it been generally accepted as it was by Bewick, original artists might have followed his example in engraving their own inventions, because then wood engraving would have been a natural and comparatively rapid art; but since the black line has been preferred the art has become a handicraft, because original artists have not time to cut out thousands of little white spaces. The reader may at once realize for himself the tediousness of the process by comparing the ease with which one writes a page of manuscript with the labor which would be involved in cutting away, with perfect accuracy, every space, however minute, which the pen had not blackened with ink.

Modern wood engraving.

Its great variety.

Pannemaker.

Pisan.

Illustrated newspapers.

The two centuries in which wood engraving has developed itself most remarkably are the 16th and the 19th. We have described the character of 16th-century work, which was easy, as the work of that time had a limited purpose and a settled character. It may not appear so easy to describe the various and unsettled work of our own time, but it is animated by a leading idea, which is universality. Wood engraving in the 19th century has no special character of its own, nothing like Bewick's work, which had a character derived from the nature of the process; but on the other hand, the modern art is set to imitate every kind of engraving and every kind of drawing. Thus we have woodcuts that imitate line engraving, others that copy etching and even mezzotint, whilst others try to imitate the crumbling touch of charcoal or of chalk, or the wash of water-color, or even the wash and the pen-line together. The art is put to all sorts of purposes; and though it is not and cannot be free, it is made to pretend to a freedom which the old masters would have rejected as an affectation. Rapid sketches are made on the block with the pen, and the modern wood engraver sets himself patiently to cut out all the spaces of white, in which case the engraver is in reality less free than his predecessor in the 16th century, though the result has a false appearance of liberty. The woodcut is like a polyglot who has learned to speak many other languages at the risk of forgetting his own. And, wonderful as may be its powers of imitation, it can only approximate to the arts which it imitates; it can never rival each of them on its own ground. It can convey the idea of etching or water-color, but not their quality; it can imitate the manner of a line engraver on steel, but it cannot give the delicacy of his lines. Whatever be the art which the wood engraver imitates, a practised eye sees at the first glance that the result is nothing but a woodcut. Therefore, although we may admire the suppleness of an art which can assume so many transformations, it is certain that these transformations give little satisfaction to severe judges. We are bound, however, to acknowledge that in manual skill and in variety of resource modern wood engravers far excel their predecessors. A Belgian wood engraver, Stéphane Pannemaker, exhibited at the Salon of 1876 a woodcut entitled La Baigneuse, which astonished the art-world by the amazing perfection of its method, all the delicate modelling of a nude figure being rendered by simple modulations of unbroken line. Both English and French publications abound in striking proofs of skill. The modern art, as exhibited in these publications, may be broadly divided into two sections, one depending upon line, in which case the black line of a pen sketch is carefully preserved, and the other depending upon tone, when the tones of a sketch with the brush are translated by the wood engraver into shades obtained in his own way by the burin. The first of these methods requires extreme care, skill, and patience, but makes little demand upon the intelligence of the artist; the second leaves him more free to interpret, but he cannot do this rightly without understanding both tone and texture. The woodcuts in Doré's *Don Quixote* are done by each method alternately, many of the designs having been sketched with a pen upon the block, whilst others are shaded with a brush in Indian ink and white, the latter being engraved by interpreting the shades of the brush. In the pen drawings the lines are Doré's, in the brush drawings the lines are the engravers. In the night scenes M. Pisan has usually adopted Bewick's system of white lines, the block being left untouched in its blackness wherever the effect permitted. Modern English wood engraving shows to great advantage in such newspapers as the *Illustrated London News* and the *Graphic*, the best of their kind in the world, and also in vignettes for book illustration, which English artists usually

Vignettes.

Compound blocks.

execute with delicacy and taste. A certain standard of vignette engraving was reached by Mr. Edmund Evans in Mr. Birket Foster's edition of Cowper's *Task*, which is not likely to be surpassed in its own way, either for delicacy of tone or for careful preservation of the drawing. An important extension of wood engraving in modern times has been due to the invention of compound blocks. Formerly a woodcut was limited in size to the dimensions of a block of boxwood cut across the grain, except in the primitive condition of the art, when commoner woods were used in the direction of the grain; but in the present day many small blocks are fitted together so as to form a single large one. They can be separated or joined together again at will, and it is this facility which has rendered possible the rapid production of large cuts for the newspapers, as many cutters work on the same subject at once, each taking his own section.

Process of modern wood engraving.

The process of modern wood engraving may be briefly described as follows. The surface of the block is lightly whitened with Chinese white so as to produce a light yellowish-gray tint, and on this the artist draws either with a pen if the work is intended to be in line, or with a hard pointed pencil and a brush if it is intended to be in shade. If it is to be a line woodcut the cutter simply digs out the whites with a sharp burin or scalpel (he has these tools of various shapes and sizes), and that is all he has to do; but if the drawing on the wood is shaded with a brush, then the cutter has to work upon the tones in such a manner that they will come relatively true in the printing. This is by no means easy, and the result is often a disappointment, besides which the artist's drawing is destroyed in the process, so that it is now customary to have the block photographed before the engraver touches it, when the drawing is specially worth preserving. This was done for Mr. Leighton's illustrations to *Romola*.

Copper and Steel Plate Engraving.

Prehistoric engraving.

Plate-printing.

Nielli.

Artistic importance of plate printing.

Engraving on plates of copper and steel is the converse of wood engraving in method. In line engraving it is the line itself which is hollowed, whereas in the woodcut, as we have seen, when the line is to print black it is left in relief, and only white spaces and white lines are hollowed. There was no difficulty about discovering the art of line engraving, which has been practised from the earliest ages. The prehistoric Aztec hatchet given to Humboldt in Mexico was just as really and truly *engraved* as a modern copper-plate with outlines after Flaxman or Thorwaldsen; the Aztec engraving is of course ruder than the European, but it is the same art. The important discovery which made line engraving one of the multiplying arts was the discovery how to print an incised line, which would not occur to every one, and which in fact was hit upon at last by accident, and known for some time before its real utility was suspected. Line engraving in Europe does not owe its origin to the woodcut, but to the chasing on goldsmiths' work. If the reader will look at any article of jewelry in which the metal is ornamented with incised designs, he will there see the true origin of our precious Dürers and Marcantonios. The history of the first plate-printing is as follows. The goldsmiths of Florence in the middle of the 15th century were in the habit of ornamenting their works by means of engraving, after which they filled up the hollows produced by the burin with a black enamel made of silver, lead, and sulphur, the result being that the design was rendered much more visible by the opposition of the enamel and the metal. An engraved design filled up in this manner was called a *niello*, and our modern door-plates are really *nielli* also, for in them too the engraved lines are filled with black. The word comes from *nigellum*, and simply refers to the color of the enamel. Whilst a niello was in progress the artist could not see it so well as if the enamel were already in the lines, and on the other hand, he did not like to put in the hard enamel prematurely, as when once it was set it could not easily be got out again. He therefore took a sulphur cast of his niello in progress, on a matrix of fine clay, and filled up the lines in the sulphur with lampblack, thus enabling himself to judge of the state of his engraving. At a later period it was discovered that a proof could be taken on damped paper by filling the engraved lines with a certain ink and wiping it off the surface of the plate, sufficient pressure being applied to make the paper go into the hollowed lines and fetch the ink out of them. This was the beginning of plate-printing, but nobody at first suspected the artistic and commercial importance of the discovery. The niello engravers thought it a convenient way of proving their work, as it saved the trouble of the sulphur cast, but they saw no further into the future. They went on engraving nielli just the same to ornament plate and furniture; nor was it until the next century that the new method of printing was carried out to its great and wonderful results. Even in our own day the full importance of it is only understood by persons who have made the fine arts a subject of special study. There are, however, certain differences between plate-printing and block-printting which affect the essentials of art. When paper is driven *into* a line so as to fetch the ink out of it, the line may be of unimaginable fineness, it will print all the same; but when the paper is only pressed *upon* a raised line, the line must have some appreciable thickness, so that the wood engraving can never be so delicate as plate engraving. Again, not only does plate printing excel block printing in delicacy; it excels it also in force and depth. There never was, and there will never be, a woodcut line having the power of a deep line in a plate, for in block printing the line is only a blackened surface of paper, whereas in plate printing it is a *cast* with an additional thickness of printing ink.

The burin.

Having limited ourselves in this article to engraving for the press, we do not stay to enumerate the niello engravers, but pass at once to the art of line engraving for prints; and first let us describe the process, which is as simple in theory as it is difficult in practice. The most important of the tools used is the burin, which is a bar of steel with one end fixed in a handle rather like a mushroom with one side cut away, the burin itself being shaped so that the cutting end of it when sharpened takes the form of a lozenge. Burins are made in many varieties to suit individual tastes and the different uses to which they are applied, but most burins resemble each other in presenting the shape of a more or less elongated lozenge at the end where they are sharpened. The burin acts exactly like a plough; it makes a furrow and turns out a shaving of metal as the plough turns the soil of a field. The burin, however, is pushed while the plough is pulled, and this peculiar character of the burin as a pushed instrument at once establishes a wide separation between it and all the other instruments employed in the arts of design, such as pencils, brushes, pens, and etching needles. The manual difficulty which has to be overcome by the engraver is in making himself master of the burin, and in order to accomplish this he is obliged to go through a great deal of simply manual practice in cutting lines. The beginner learns to cut straight lines and curves of various degrees of depth, and to cross them so that the interstices may form squares, lozenges, triangles, etc. These exercises, after long practice, give a degree of manual skill which has been often misemployed in ingenious trifling, to the detriment of true artistic quality, so that laborious men have wasted their time in cutting patterns like woven wire, and carefully inserting a dot in the middle of every lozenge or square. Whilst avoiding this error, which has been the bane of engraving, the student should train his hand and eye by copying portions of good prints directly on the metal, as a modern engraver cannot work in ignorance of the language of his art, though he may employ it in his own way afterwards. It is, however, unfortunately true that set methods, which may be called the business of engraving, have a tendency to become much more predominant than in the sister art of painting, so that real originality expresses itself much less frequently with the burin than with the brush.

Elements of burin engraving on metal.

The elements of engraving with the burin upon metal will be best understood by an example of a very simple kind, as in the engraving of letters. The capital letter B contains in itself the rudiments of an engraver's education. As at first drawn, before the blacks are inserted, this letter consists of two perpendicular straight lines and four curves, all the curves differing from each other. Suppose, then, that the engraver has to make a B, he will scratch these lines very lightly with a sharp point or style. The next thing is to cut out the blacks (not the whites, as in wood engraving), and this would be done with two different burins. The engraver would get his vertical black line by a powerful ploughing with the burin between his two preparatory first lines, and then take out some copper in the thickest parts of the two curves. This done he would then take a finer burin and work out the gradation from the thick line in the midst of the curve to the thin extremities which touch the perpendicular. When there is much gradation in a line the darker parts of it are often gradually ploughed out by returning to it over and over again. The hollows so produced are afterwards filled with printing ink, just as the hollows in a niello were filled with black enamel; the printing ink is wiped from the smooth surface of the copper, damped paper is laid upon it, and driven into the hollowed letter by the pressure of a rolling cylinder; it fetches the ink out, and you have your letter B in intense black upon a white ground.

When the surface of a metal plate is sufficiently polished to be used for engraving, the slightest scratch upon it will print as a black line, the degree of blackness being proportioned to the depth of the scratch. Most readers of these pages will possess an engraved plate from which visiting cards are printed. Such a plate is a good example of some elementary principles of engraving. It contains thin lines and thick ones, and a considerable variety of curves. An elaborate line engraving, if it is a pure line engraving and nothing else, will contain only these simple elements in different combinations. The real line engraver is always engraving a line more or less broad and deep in one direction or another; he has no other business than this.

We may now pass to the early Italian and early German prints, in which the line is used with such perfect simplicity of purpose that the methods of the artists are as legible as if we saw them actually at work.[1]

Early Italian line engraving.

The student may soon understand the spirit and technical quality of the earliest Italian engraving by giving his attention to a few of the series which used erroneously to be called the *Playing Cards of Mantegna.* "The series," says Professor Colvin, "consists of fifty pieces, divided into sets of ten each. Of these five sets, each is marked with an initial letter, A, B, C, D, E, and every print of the series carries besides an Arabic numeral, 1, 2, 3, up to 50. Only the numerical order, which shows how the series is meant to be arranged and studied, reverses the alphabetical order which corresponds with the respective dignity of the subject; thus Nos. 1–10 are lettered as class E, Nos. 11–20 as class D, and so on. This number, fifty, and this plan of subdivision by tens, are quite inconsistent with the supposed destination of the series as playing-cards; and so also are the subjects of the series. They represent a kind of encyclopædia of knowledge, proceeding upwards from earthly to transcendental things,—first, the various orders and conditions of men; second, the nine muses and Apollo; third, the seven liberal arts, with poetry, theology, and philosophy added to complete the group of ten; fourth, the four cardinal and three theological virtues, with three singular personifications or geniuses added to complete ten—a genius of time, a genius of the sun, and a genius of cosmos, the world; fifth, the planets, in their mythological, astrological, and astronomical signification, with the three outer spheres added to make up the ten—viz., the eighth, or sphere of the fixed stars, the Primum Mobile, or inclosing sphere, which by its rotation imparts rotation to the rest within, and the Prima Causa, or empyrean sphere, the unrevolving abiding place of Deity. The series is, therefore, as the most recent critics have called it, a moral and educational series, or instructive picture-book."

Technical principles.

We have not space to enter into the controversy about the origin of these engravings. They are supposed to be Florentine; they are certainly Italian; and their technical manner is called that of Baccio Baldini, of whose biography nothing is known. But if the history of these engravings is obscure, their style is as clear as a style can be. There is not room for a moment's doubt about the artist's conception of his art. In all these figures the outline is the main thing, and next to that the lines which mark the leading folds of the drapery, lines quite classical in purity of form and severity of selection, and especially characteristic in this, that they are always really engraver's lines, such as may naturally be done with the burin, and they never imitate the freer line of the pencil or etching needle. As for shading, it is used in the greatest moderation with thin straight strokes of the burin, that never overpower the stronger organic lines of the design. Of chiaroscuro, in any complete sense, there is none. The sky behind the figures is represented by white paper, and the foreground is sometimer occupied by flat decorative engraving, much nearer in feeling to caligraphy than to modern painting. Sometimes there is a cast shadow, but it is not studied and is only used to give relief. We may observe that in this early metal engraving the lines are often crossed in the shading, whereas in the earliest woodcuts they are not; the reason being that when lines are incised they can as easily be crossed as not, whereas, when they are reserved, the crossing involves much labor of a non-artistic kind. Here, then, we have pure line-engraving with the burin, that is, the engraving of the pure line patiently studied for its own beauty, and exhibited in an abstract manner, with care for natural form combined with inattention to the effects of nature. Even the forms, too, are idealized, especially in the cast of draperies, for the express purpose of exhibiting the line to better advantage. Such are the characteristics of those very early Italian engravings which were attributed erroneously to Mantegna. When we come to Mantegna himself we find a style equally decided. Drawing and shading were for him two entirely distinct things. He did not draw and shade at the same time, as a modern chiaroscurist would, but he first got his outlines and the patterns on his dresses all very accurate and right, and then threw a veil of shading over them, and a very peculiar kind of shading it was, all the lines being straight and all the shading diagonal. This is the primitive method, its peculiarities being due, not to a learned self-restraint, but to a combination of natural genius with technical inexperience, which made the early Italians at once desire and discover the simplest and easiest methods. But whilst the Italians were shading with straight lines the Germans had begun to use curves, and as soon as the Italians saw good German work they abandoned their old stiff practice and tried to give to their burins something of the German suppleness.

Mantegna.

Early German engraving on metal. Schongauer.

The characteristics of early metal engraving in Germany are seen to perfection in Martin Schongauer and Albert Dürer, who, though with striking differences, had many points in common. Schongauer was the earlier artist of the two, as he died in 1488; whilst the date of Dürer's death is 1528, just forty years later. Schongauer was therefore a whole generation before Dürer, yet scarcely inferior to him in the use of the burin, though Dürer has a much greater reputation, due in great measure to his singular imaginative powers. Schongauer is the first great German engraver who is known to us by name, but he was preceded by an unknown German master, whom we now call the master of 1466, who had Gothic notions of art (in strong contrast to the classicism of Baccio Baldini), but used the burin skilfully in his own way, conceiving of line and shade as separate elements, yet shading with an evident desire to follow the form of the thing shaded, and with lines in various directions. Schongauer's art is a great stride in advance, and we find in him an evident pleasure in the bold use of the burin. Outline and shade, in Schongauer, are not nearly so much separated as in Baccio Baldini, and the shading, generally in curved lines, is far more masterly than the straight shading of Mantegna.

---

[1] It may be well to say something here about the accessibility of examples. Any one living in London can study engraving at its sources to the fullest extent in fine impressions belonging to that little-appreciated treasure-house, the print-room of the British Museum, but the difficulty is for students who live in the provinces or in distant colonies. This difficulty has been overcome of late years by the perfection to which M. Amand Durand has brought the art of photographic engraving originally invented by Niepce, and now called *héliogravure.* By means of this a new plate can be produced from an impression of an old engraving without touching the print, and so perfect that the impressions yielded by the new plate can only be distinguished from old prints by an expert, and not always with certainty by him, so that they have to be marked on the back to prevent fraud. M. Amand Durand has made it his principal business to reproduce engravings by the old masters; so that the provincial or colonial student may now possess in his own cabinet a selection of the best examples. One thing only it is necessary for him to bear in mind. There are two sorts of *héliogravure,*—that which prints like a copper-plate and that which prints like a woodcut. Both are used for book illustration, and indiscriminately, so that the student will often meet with a plate-engraving which has been reproduced to print like a woodcut, and whenever he does so he ought not to pay the slightest attention to it, for no plate-engraving can ever be reproduced as a woodcut without the loss of its finest technical qualities. A plate so reproduced will no doubt retain its composition and expression, though even the expression may often lose a little from the greater coarseness of the lines; but all its quality as workmanship, all the delicacy of the manual art, is sacrificed, merely that it may be printed more cheaply. The student should therefore resolutely turn away from all *typographic* héliogravures after engraved plates, and confine his attention to those which are printed as the original plates were printed, a matter which he can easily ascertain for himself by seeing that there is a plate mark, the colorless mark produced by the edges of the plate upon the paper. M. Amand Durand has published many copies from engravings by different old masters, including complete sets from the original works of Vandyke, Paul Potter, Claude, and Albert Dürer. Such reproductions as these are really available for purposes of study, but the quantity of different photographic processes invented of late years has inundated the market with the most various kinds of more or less defective reproductions, which the student ought carefully to avoid. And however perfect the process may be, all reproductions *on a reduced scale* should be rejected at once by students, for the manner of working adopted by a true master depends always upon the scale of his engraving. Dürer will put more into a large plate than into a little one; and when a large plate by Dürer is reduced by a photographic process, the reduction, by its microscopic abundance of detail, conveys a false idea of Dürer's practice as an artist. The reductions of old engravings which are now so frequently used for book-illustrations are more injurious than helpful to any right appreciation of engraving. Reduction is good only when the artist worked with a view to it, as is now often done in drawings *intended* to be reproduced photographically with a *foreseen* diminution of scale.

Dürer.

Dürer continued Schongauer's curved shading, with increasing manual delicacy and skill; and as he found himself able to perform feats with the burin which amused both himself and his buyers, he overloaded his plates with quantities of living and inanimate objects, each of which he finished with as much care as if it were the most important thing in the composition. The engravers of those days had no conception of any necessity for subordinating one part of their work to another; they drew, like children, first one object and then another object, and so on until the plate was furnished from top to bottom and from the left side to the right. Here, of course, is an element of facility in primitive art which is denied to the modern artist. In Dürer all objects are on the same plane. In his St. Hubert, the stag is quietly standing on the horse's back, with one hoof on the saddle, and the kneeling knight looks as if he were tapping the horse on the nose. Dürer seems to have perceived the mistake about the stag, for he put a tree between us and the animal to correct it, but the stag is on the horse's back nevertheless. This ignorance of the laws of effect is least visible and obtrusive in plates which have no landscape distances, such as The Coat of Arms with the Death's Head and The Coat of Arms with the Cock.

His minuteness.

Dürer's great manual skill and close observation made him a wonderful engraver of objects taken separately. He saw and rendered all objects; nothing escaped him; he applied the same intensity of study to everything. Though a thorough student of the nude (witness his Adam and Eve, and other plates), he would pay just as much attention to the creases of a gaiter as to the development of a muscle; and though man was his main subject, he would study dogs with equal care (see the five dogs in the St. Hubert), or even pigs (see the Prodigal Son); and at a time when landscape painting was unknown he studied every clump of trees, every visible trunk and branch, nay, every foreground plant, and each leaf of it separately. In his buildings he saw every brick like a bricklayer, and every joint in the woodwork like a carpenter. The immense variety of the objects which he engraved was a training in suppleness of hand. His lines go in every direction, and are made to render both the undulations of surface (see the plane in the Melancholia) and their texture (see the granular texture of the stones in the same print).

Marcantonio.

From Dürer we come to Italy again, through Marcantonio, who copied Dürer, translating more than sixty of his woodcuts upon metal. It is one of the most remarkable things in the history of art, that a man who had trained himself by copying northern work, little removed from pure Gothicism, should have become soon afterwards the great engraver of Raphael, who was much pleased with his work and aided him by personal advice. Yet, although Raphael was a painter, and Marcantonio his interpreter, the reader is not to infer that engraving had as yet subordinated itself to painting.

Raphael's influence.

Raphael himself evidently considered engraving a distinct art, for he never once set Marcantonio to work from a picture, but always (much more judiciously) gave him drawings, which the engraver might interpret without going outside of his own art; consequently Marcantonio's works are always genuine engravings, and are never pictorial. Marcantonio was an engraver of remarkable power. In him the real pure art of line-engraving reached its maturity. He retained much of the early Italian manner in his backgrounds, where its simplicity gives a desirable sobriety; but his figures are boldly modelled in curved lines, crossing each other in the darker shades, but left single in the passages from dark to light, and breaking away in fine dots as they approach the light itself, which is of pure white paper. A school of engraving was thus founded by Raphael, through Marcantonio, which cast aside the minute details of the early schools for a broad, harmonious treatment.

We cannot here give a detailed account of the northern and southern schools of line-engraving, which, after Dürer and Marcantonio, developed themselves with great rapidity and were ennobled by many famous names, but although we cannot give lists of these, we may direct the student to a school of engraving which marked a new development, the group known as the engravers of Rubens.

The influence of Rubens.

That great painter understood the importance of engraving as a means of increasing his fame and wealth, and directed Vorsterman and others, as Raphael had directed Marcantonio. The theory of engraving at that time was that it ought not to render accurately the local color of painting, which would appear wanting in harmony when dissociated from the hues of the picture; and it was one of the anxieties of Rubens so to direct his engravers that the result might be a fine plate independently of what he had painted. To this end he helped his engravers by drawings, in which he sometimes went so far as to indicate what he thought the best direction for the lines.

Vorsterman and other engravers of Rubens.

Rubens liked Vorsterman's work, and scarcely corrected it, a plate he especially approved being Susannah and the Elders, which is a learned piece of work well modelled, and shaded everywhere on the figures and costumes with fine curved lines, the straight line being reserved for the masonry. Vorsterman quitted Rubens after executing fourteen important plates, and was succeeded by Paul Pontius, then a youth of twenty, who went on engraving from Rubens with increasing skill until the painter's death. Boetius a Bolswert engraved from Rubens towards the close of his life, and his brother Schelte a Bolswert engraved more than sixty compositions from Rubens, of the most varied character, including hunting scenes and landscapes. This brings us to the engraving of landscape as a separate study. Rubens treated landscape in a very broad comprehensive manner, and Schelte's way of engraving it was also broad and comprehensive. The lines are long and often undulating, the cross-hatchings bold and rather obtrusive, for they often substitute unpleasant reticulations for the refinement and mystery of nature, but it was a beginning, and a vigorous beginning. The technical developments of engraving under the influence of Rubens may be summed up briefly as follows:—1. The Italian outline had been discarded as the chief subject of attention, and modelling had been substituted for it; 2, Broad masses had been substituted for the minutely finished detail of the northern schools; 3. A system of light and dark had been adopted which was not pictorial, but belonged especially to engraving, which it rendered (in the opinion of Rubens) more harmonious.

Results of his influence.

The history of line-engraving, from the time of Rubens to the beginning of the 19th century, is rather that of the vigorous and energetic application of principles already accepted than any new development. From the two sources we have already indicated, the school of Raphael and the school of Rubens, a double tradition flowed to England and France, where it mingled and directed English and French practice.

English and French line-engraving.

The first influence on English line-engraving was Flemish, and came from Rubens through Vandyke, Vorsterman, and others; but the English engravers soon underwent French and Italian influences, for although Payne learned from a Fleming, Faithorne studied in France under the direction of Philippe de Champagne the painter, and Robert Nanteuil the engraver.

Strange.

Sir Robert Strange studied in France under Philippe Lebas, and then five years in Italy, where he saturated his mind with Italian art. French engravers came to stay and work in England as they went to study in Italy, so that the art of engraving became in the 18th century a cosmopolitan language. In figure-engraving the outline was less and less insisted upon. Strange made it his study to soften and lose the outline.

Audran.

Meanwhile, the great classical Renaissance school, with Gérard Audran at its head, had carried for-

Influence of Claude.

ward the art of modelling with the burin, and had arrived at great perfection of a sober and dignified kind. Audran was very productive in the latter half of the 17th century, and died in 1703, after a life of severe self-direction in labor, the best external influence he underwent being that of the painter Nicolas Poussin. He made his work more rapid by the use of etching, but kept it entirely subordinate to the work of the burin. One of the finest of his large plates is St. John Baptizing, from Poussin, with groups of dignified figures in the foreground and a background of grand classical landscape, all executed with the most thorough knowledge according to the ideas of that time. The influence of Claude Lorrain on the engraving of landscape was exercised less through his etchings than his pictures, which compelled the engravers to study delicate distinctions in the values of light and dark. In this way, through Woollet and Vivarès, Claude exercised an influence on landscape engraving almost equal to that of Raphael and Rubens on the engraving of the figure, though he did not, like those painters, direct his engravers personally.

Line-engraving in the 19th century.

Characteristics of modern work.

Mixed methods.

Turner's influence upon engraving.

In the 19th century line-engraving has received both an impulse and a check, which by many is thought to be its death-blow. The impulse came from the growth of public wealth, the increasing interest in art and the increase in the commerce of art, which now, by means of engraving, penetrated into the homes of the middle classes, as well as from the growing demand for illustrated books, which have given employment to engravers of first-rate ability. The check to line-engraving has come from the desire for cheaper and more rapid methods, a desire satisfied in various ways, but especially by etching and by the various kinds of photography. Nevertheless, the 19th century has produced most highly accomplished work in line-engraving, both in the figure and in landscape. Its characteristics, in comparison with the work of other centuries, are chiefly a more thorough and delicate rendering of local color, light and shade, and texture. The elder engravers could draw as correctly as the moderns, but they either neglected these elements or admitted them sparingly, as opposed to the spirit of their art. If you look at a modern engraving from Landseer, you will see the blackness of a gentleman's boots (local color), the soft roughness of his coat (texture), and the exact value in light and dark of his face and costume against the cloudy sky. Nay, more, you will find every sparkle on bit, boot, and stirrup. Modern painting pays more attention to texture and chiaroscuro than classical painting did, so engraving has followed in the same directions. But there is a certain sameness in pure line-engraving which is more favorable to some forms and textures than to others. This sameness of line-engraving, and its costliness, have led to the adoption of mixed methods, which are extremely prevalent in modern commercial prints from popular artists. In the well-known prints from Rosa Bonheur, for example, by T. Landseer, H. T. Ryall, and C. G. Lewis, the tone of the skies is got by machine-ruling, and so is much undertone in the landscape; the fur of the animals is all etched, and so are the foreground plants, the real burin-work being used sparingly where most favorable to texture. Even in the exquisite engravings after Turner, by Cooke, Goodall, Wallis, Miller, Willmore, and others, who reached a degree of delicacy in light and shade far surpassing the work of the old masters, the engravers have recourse to etching, finishing with the burin and dry point. Turner's name may be added to those of Raphael, Rubens, and Claude in the list of painters who have had a special influence upon engraving. The specialty of Turner's influence was in the direction of delicacy of tone. In this respect the Turner vignettes to Rogers's poems were a high-water mark of human attainment, not likely ever to be surpassed.

Jeens.

Gaillard.

Pure line-engraving is still practised by a few artists in England and France. In England, Mr. Jeens is a direct descendant of the great line-engravers, and will take high rank in the future by the perfection of his drawing and the good taste with which he has used the burin in shading. In France, the lovers of line-engraving have endeavored to keep it alive by organizing themselves into a society for its encouragement. The most recent direction of the art, in the works of Ferdinand Gaillard, is a return to studied outline, but in combination with the most elaborate modelling. In his St. Sebastian the outline is studied and marked with careful firmness throughout, and the modelling is thoroughly worked out in minute touches and fine lines, giving powerful relief without any but the most delicate chiaroscuro.

Etching.

Etymology.

We mentioned etching amongst the causes which have operated destructively on line-engraving. The chief difference between the two arts is that in line-engraving the furrow is produced by the ploughing of the burin, whereas in etching the copper is eaten away by acid. The English word is merely an Anglicized form of the Dutch *etsen*, which has the same origin as our verb to eat, consequently, unless there is corrosion, or eating away of substance, there is no etching. The word is vulgarly and most erroneously used for pen drawing.

Preparation of the plate.

Bosse's ground.

Covering the plate.

Smoking the plate.

Liquid grounds.

Tracing.

The needle.

To prepare a plate for etching it is first covered with etching-ground, a composition which resists acid. The qualities of a ground are to be so adhesive that it will not quit the copper when a small quantity is left isolated between lines, yet not so adhesive that the etching point cannot easily and entirely remove it; at the same time a good ground will be hard enough to bear the hand upon it, or a sheet of paper, yet not so hard as to be brittle. The best is that of Abraham Bosse, which is composed as follows:—Melt two ounces of white wax; then add to it one ounce of gum-mastic in powder, a little at a time, stirring till the wax and the mastic are well mingled; then add, in the same manner, an ounce of bitumen in powder. There are three different ways of applying an etching-ground to a plate. The old-fashioned way was to wrap a ball of the ground in silk, heat the plate, and then rub the ball upon the surface, enough of the ground to cover the plate melting through the silk. To equalize the ground a dabber was used, which was made of cotton-wool under horsehair, the whole inclosed in silk. This method is still used by many artists, from tradition and habit, but it is far inferior in perfection and convenience to that which we will now describe. When the etching-ground is melted, add to it half its volume of essential oil of lavender, mix well, and allow the mixture to cool. You have now a paste which can be spread upon a cold plate with a roller; these rollers are covered with leather and made (very carefully) for the purpose. You first spread a little paste on a sheet of glass (if too thick, add more oil of lavender and mix with a palette knife), and roll it till the roller is quite equally charged all over, when the paste is easily transferred to the copper, which is afterwards gently heated to expel the oil of lavender. In both these methods of grounding a plate the work is not completed until the ground has been smoked, which is effected as follows. The plate is held by a hand-vice if a small one, or, if large, is fixed at some height, with the covered side downwards. A smoking torch, composed of many thin bees-wax dips twisted together, is then lighted and passed repeatedly under the plate in every direction, till the ground has incorporated enough lampblack to blacken it. The third way of covering a plate for etching is to apply the ground in solution as collodion is applied by photographers. The ground may be dissolved in chloroform, or in oil of lavender. The plate being grounded, its back and edges are protected from the acid by Japan varnish, which soon dries, and then the drawing is traced upon it. The best way of tracing a drawing is to use sheet gelatine, which is employed as follows. The gelatine is laid upon the drawing, which its transparency allows you to see perfectly, and you trace the lines by scratching the smooth surface with a sharp point. You then fill these scratches with fine black-lead in powder, rubbing it in with the finger, turn the tracing with its face to the plate, and rub the back of it with a burnisher. The black-lead from the scratches adheres to the etching ground and shows upon it as pale gray, much more visible than anything else you can use for tracing. Then comes the work of the etching-needle, which is merely a piece of steel sharpened more or less. Turner used a prong of an old steel fork, which did as well as anything, but neater etching-needles are sold by artists' colormakers.

The needle removes the acid and lays the copper bare. Some artists sharpen their needles so as to present a cutting edge which, when used sideways, scrapes away a broad line; and many etchers use needles of various degrees of sharpness to get thicker or thinner lines.

Thick and thin lines.

It may be well to observe, in connection with this part of the subject, that whilst thick lines agree perfectly well with the nature of woodcut, they are very apt to give an unpleasant heaviness to plate engraving of all kinds, whilst thin lines have generally a clear and agreeable appearance in plate engraving. Nevertheless, lines of moderate thickness are used effectively in etching when covered with finer shading, and very thick lines indeed were employed with good results by Turner when he intended to cover them with mezzotint, and to print in brown ink, because their thickness was essential to prevent them from being overwhelmed by the mezzotint, and the brown ink made them print less heavily than black. Etchers differ in opinion as to whether the needle ought to scratch the copper or simply to glide upon its surface. A gliding needle is much more free, and therefore communicates a greater appearance of freedom to the etching, but it has the inconvenience that the etching-ground may not always be entirely removed, and then the lines may be defective from insufficient biting. A scratching needle on the other hand, is free from this serious inconvenience, but it must not scratch irregularly so as to *engrave* lines of various depth.

Biting.

The *biting* in former times was generally done with a mixture of nitrous acid and water, in equal proportions; but in the present day a Dutch mordant is a good deal used, which is composed as follows:—Hydrochloric acid, 100 grammes; chlorate of potash, 20 grammes; water, 880 grammes. To make it, heat the water, add the chlorate of potash, wait till it is entirely dissolved, then add the acid. The nitrous mordant acts rapidly, and causes ebullition; the Dutch mordant acts slowly, and causes no ebullition. The nitrous mordant widens the lines; the Dutch mordant bites in depth, and does not widen the lines to any perceptible degree. The time required for both depends upon temperature. A mordant bites slowly when cold, and more and more rapidly when heated. To obviate irregularity caused by difference of temperature, the writer of this paper has found it a good plan to heat the Dutch mordant artificially to 95° Fahr. by lamps under the bath (for which a photographer's porcelain tray is most convenient), and keep it steadily to that temperature; the results may then be counted upon; but whatever the temperature fixed upon, the results will be regular if it is regular. To get different degrees of biting on the same plate the lines which are to be pale are "stopped out" by being painted over with Japan varnish or with etching-ground dissolved in oil of lavender, the darkest lines being reserved to the last, as they have to bite longest. When the acid has done its work properly the lines are bitten in such various degrees of depth that they will print with the degree of blackness required; but if some parts of the subject require to be made paler, they can be lowered by rubbing them with charcoal and olive oil, and if they have to be made deeper they can be rebitten, or covered with added shading.

Reducing.

Rebiting.

Rebiting is done with the roller above mentioned, which is now charged very lightly with paste and rolled over the copper with no pressure but its own weight, so as to cover the smooth surface, but not fill up any of the lines. The oil of lavender is then expelled as before by gently heating the plate, but it is not smoked. The lines which require rebiting may now be rebitten, and the others preserved against the action of the acid by stopping out. These are a few of the most essential technical points in etching, but there are many matters of detail for which the reader is referred to the special works on the subject.

The two countries in which etching has been most practised are Holland and France. It has also been successfully practised in Italy, Germany, and England, but not to so great an extent. It has resembled line-engraving in receiving a powerful impulse from celebrated painters, but whereas with the exception of Albert Dürer the painters have seldom been practical line-engravers, they have advanced etching not only by advice given to others but by the work of their own hands.

Influence of Rembrandt and Claude.

Rembrandt did as much for etching as either Raphael or Rubens for line-engraving; and in landscape the etchings of Claude had an influence which still continues, both Rembrandt and Claude being practical workmen in etching, and very skilful workmen. And not only these, but many other eminent painters have practised etching successfully, each in his own way. Ostade, Ruysdael, Berghem, Paul Potter, Karl Dujardin, etched as they painted, and so did a greater than any of them, Vandyke. In the earlier part of the present century etching was almost a defunct art, except as it was employed by engravers as a help to get faster through their work, of which "engraving" got all the credit, the public being unable to distinguish between etched lines and lines cut with the burin.

The revival of etching.

During the last fifteen or twenty years, however, there has been a great revival of etching as an independent art, a revival which has extended all over Europe, though France has had by far the largest and most important share in it. It was hoped, at the beginning of this revival, that it would lead to the production of many fine original works; but the commercial laws of demand and supply have unfortunately made modern etching almost entirely the slave of painting. Nearly all the clever etchers of the present day are occupied in translating pictures, which many of them, especially Unger, Jacquemart, Flameng, and Rajon, do with remarkable ability, even to the very touch and texture of the painter. The comparative rapidity of the process, and the ease with which it imitates the manner of painters, have caused etching to be now very generally preferred to line-engraving by publishers for the translation of all pictures except those belonging to a severe and classical style of art, for which the burin is, and will always remain, better adapted than the etching-needle.

Yet, notwithstanding the present commercial predominance of etching from pictures, there are still some artists and eminent amateurs who have cultivated original etching with success. Mr. Seymour Haden, Mr. Whistler, Mr. Samuel Palmer, and others in England, MM. Bracquemond, Daubigny, Charles Jacque, Appian, Lalanne, and others on the Continent, besides that singular and remarkable genius Charles Méryon, have produced original works of very various interest and power. Etching clubs, or associations of artists for the publication of original etchings, have been founded in England, France, Germany, and Belgium. The real difficulty of the art, and its apparent facility, have led to much worthless production, but this ought not to make us overlook what is really valuable.

Styles of etching.

The following is a brief analysis of different styles of etching. 1. *Pure Line.*—As there is line-engraving, so there is line-etching; but as the etching-needle is a freer instrument than the burin, the line has qualities which differ widely from those of the burin line. Each of the two has its own charm and beauty; the liberty of the one is charming, and the restraint of the other is admirable also in its right place. In line-etching, as in line-engraving, the great masters purposely exhibit the line and do not hide it under too much shading. 2. *Line and Shade.*—This answers exactly in etching to Mantegna's work in engraving. The most important lines are drawn first throughout, and the shade thrown over them like a wash with the brush over a pen sketch in indelible ink. 3. *Shade and Texture.*—This is used chiefly to imitate oil-painting. Here the line (properly so called) is entirely abandoned, and the attention of the etcher is given to texture and chiaroscuro. He uses lines, of course, to express these, but does not exhibit them for their own beauty; on the contrary, he conceals them.

Of these three styles of etching the first is technically the easiest, and being also the most rapid, is adopted for sketching on the copper from nature; the second is the next in difficulty; and the third the most difficult, on account of the biting, which is never easy to manage when it becomes elaborate. The etcher has, however, many resources; he can make passages paler by burnishing them, or by using charcoal, or he can efface them entirely with the scraper and charcoal; he can darken them by rebiting or by regrounding the plate and adding fresh work; and he need not run the risk of biting the very palest passages of all, because these can be easily done with the dry point, which is simply a well-sharpened stylus used directly on the copper without the help of acid. It is often asserted that any one can etch who can draw, but this is a mistaken assertion likely to mislead. Without requiring so long an apprenticeship as the burin, etching is a very difficult art indeed, the two main causes of its difficulty being that the artist does not see his work properly as he proceeds, and that mistakes or misfortunes in the biting, which are of frequent occurrence to the inexperienced, may destroy all the relations of tone.

Aquatint.

Aquatint.—This is a kind of etching which successfully imitates washes with a brush. There are many ways of preparing a plate for aquatint, but the following is the best. Have three different solutions of rosin in rectified alcohol, making them of various degrees of strength, but always thin enough to be quite fluid, the weakest solution being almost colorless. First pour the strongest solution on the plate. When it dries it will produce a granulation; and you may now bite as in ordinary etching for your darker tones, stopping out what the acid is not to operate upon, or you may use a brush charged with acid, perchloride of iron being a very good mordant for the purpose. After cleaning the plate, you proceed with the weaker solutions in the same way, the weakest giving the finest granulation for skies, distances, etc. The process requires a good deal of stopping-out, and some burnishing, scraping, etc., at last. It has been employed very successfully by M. Brunet Debaines in his plates from Turner, especially in Agrippina landing with the Ashes of Germanicus. Aquatint may be effectively used in combination with line-etching, and still more harmoniously with soft ground etching in which the line imitates that of the lead pencil.

Tendency of engraving to tone and texture.

The natural tendency of the three kinds of engraving we have studied is from line to shade and from shade to texture. The perfection of line is seldom maintained when the attention of artists has been directed to the other elements, for line is a separate study. Shade is its enemy, but line may still survive under a veil of half shade. When chiaroscuro becomes complete the delicacy of line, which is an abstraction, is nearly lost; and when texture becomes an object also, the line is lost altogether. This appears to be the natural law of development in the graphic arts, and it is an approach to nature, which is all shade and texture without line; yet the pure line is a loss in art, from its ready expression of the feeling of the artist, and a loss for which more natural truth is not always a compensation.

Mezzotint.

Invention of mezzotint engraving.

Preparation of the plate.

The process.

Of all the kinds of engraving, mezzotint comes nearest to nature, though it is far from being the best as a means of artistic expression. It is said to have been invented by Prince Rupert, or by Lewis Siegen, a lieutenant in his service, in or about the year 1611, and to have been suggested by the rust on a weapon which a soldier was cleaning. The plate is prepared (before any design is made upon it) by means of an instrument like a chisel, with the edge ground into the segment of a circle like the rocker of a cradle, and so engraved as to present when sharp about 100 or 120 small teeth. This cradle is rocked from side to side with the hand, and every tooth makes a small dent in the copper, and raises a corresponding bur. The whole surface of the plate is gone over with this instrument about eighty times, in different directions, before it is in a fit condition to be worked upon. When sufficiently prepared it presents a fine soft-looking and perfectly even grain, and if in this state a proof is taken from it by the usual process of copper-plate printing, the result is nothing but the richest possible black. The engraver works from dark to light by removing the grain with a scraper, and exactly in proportion as he removes it the tint becomes paler and paler. Pure whites are got by scraping the grain away entirely, and burnishing the place. As the process is from dark to light, the engraver has to be very cautious not to remove too much of his grain at once. He proceeds gradually from dark to half-dark, from half-dark to middle-tint, from middle-tint to half-light, and from half-light to light. He has nothing to do with line, but thinks entirely of massses relieved from each other by chiaroscuro. When the work is good the result is soft and harmonious, well adapted to the interpretation of some painters, but not of all. As the art has been most practised in England, some of its most successful work has been employed in the translation of English artists. More than a hundred engravers in mezzotint employed themselves on the portraits of Sir Joshua Reynolds, and the best of their works are now valued as the classics of the art, which is connected with the name of Reynolds just as line-engraving is connected with that of Raphael. Turner and Constable's landscapes were also admirably engraved in mezzotint by Lupton and others, Turner himself being a good mezzotint engraver, though he practised the art little. Mezzotint engraving is still practised in England with great skill by Cousens and others, and would no doubt be more resorted to than it is if the plates yielded larger editions, but unfortunately they soon show signs of wear.

The engravers of Reynolds.

Lupton.

Cousens.

Dry point.

Dry point is really nothing but mezzotint in line. As the point of the stylus makes its scratch on the copper, it raises a bur, which retains the ink in the printing just as the bur from the cradle does in mezzotint. The bur of dry point also wears away fast, and yields but few impressions.

Copper, steel, and zinc are the metals chiefly used for engraving. Steel is less employed than formerly, because copper is now covered with a coat of steel by the electrotype process, which enables it to resist printing indefinitely, as the steel can be renewed at will. Zinc is similarly coated with copper, and sometimes used for small editions.

Authorities.—A real knowledge of engraving can only be attained by a careful study and comparison of the prints themselves, or of accurate facsimiles, so that books are of little use except as guides to prints when the reader happens to be unaware of their existence, or else for their explanation of technical processes. The department of art-literature which classifies prints is called *Iconography*, and the classifications adopted by iconographers are of the most various kinds. For example, if a complete book were written on Shakespearian iconography it would contain full information about all prints illustrating the life and works of Shakespeare, and in the same way there may be the iconography of a locality or of a single event. The history of engraving is a part of iconography, and there are already various histories of the art in different languages. In England Mr. W. Y. Ottley wrote an *Early History of Engraving*, published in two volumes 4to, 1816, and began what was intended to be a series of notices on engravers and their works. Mr. H. Ottley has also written upon the same subject. The facilities for the reproduction of engravings by the photographic processes have of late years given an impetus to iconography. One of the most reliable modern writers on the subject is M. Georges Duplessis, the keeper of prints in the national library of France. He has written the *History of Engraving in France*, and has published many notices of engravers to accompany the reproductions by M. Amand Durand. He is also the author of a useful little manual entitled *Les Merveilles de la Gravure*. Count de Laborde collected materials for a history of wood-engraving, and began to publish them, but the work advanced no farther than a first number. Jansen's work on the origin of wood and plate engraving, and on the knowledge of prints of the 15th and 16th centuries, was published at Paris in two volumes 8vo in 1808. Didot's *Essai typographique et bibliographique sur l'histoire de la gravure sur bois* was published in Paris (8vo) in 1863. A *Treatise on Wood Engraving*, by John Jackson, appeared in 1839, and a second edition of the work in 1861. A good deal of valuable scattered information about engraving is to be found in the back numbers of the principal art periodicals, such as the *Gazette des Beaux-Arts*, *L'Art*, and the *Portfolio*. In the year 1877 Professor Colvin published a series of articles in the *Portfolio* on "Albert Dürer, His Teachers, His Rivals, and His Followers," which contain in a concentrated form the main results of what is known about the early engravers, with facsimiles from their works. Professor Ruskin has also published a volume on engraving, entitled *Ariadne Florentina*, in which the reader will find much that is suggestive; but he ought to be on his guard against certain assertions of the author, especially these two,—(1) that all good engraving rejects chiaroscuro, and (2) that etching is an indolent and blundering process at the best. The illustrations to this volume are of unequal merit; the facsimiles from Holbein are good; the reductions of early Italian engravings are not good. The reader will find information about engraving, and many facsimiles of old woodcuts, in the different volumes by Paul Lacroix on the Middle Ages and the Renaissance, published by Firmin Didot; the information may be relied upon, but the facsimiles, though effective, are not always perfect. Roret's *Collection de Manuels formant une Encyclopédie des Sciences et des Arts* contains a pocket volume on engraving which is full of useful practical information, and another similar volume on plate-printing, also very useful to engravers on metal, who ought always to understand printing: these volumes may be had separately. Etching has been the subject of several different treatises. The oldest is that of Abraham Bosse, published at Paris in 1645, 8vo, and in 1701, 12mo. The revival of etching in our own day has been accompanied by the publication of various treatises. The first was a short account of the old process by Mr. Alfred Ashley; then came the French *brochure* of M. Maxime Lalanne; then *Etching and Etchers* (450 pages, in the stereotyped edition) by the writer of this article, and a smaller treatise, *The Etcher's Handbook*, by the same. These were followed by another short French handbook, that of M. Martial. For information about the states of plates, their prices, their authenticity and history, the student ought to consult the best catalogue-makers, such as Bartsch, Claussin, Charles Blanc, etc. The literature of engraving is now rapidly increasing in consequence of the new processes of reproduction, and the great engravers of past times are becoming much better known. Works on the subject frequently appear, not only in England and France, but also in Germany, whilst Holland and Italy bring their contributions to general iconography. In consequence of this rapid extension of studies on the subject, any attempt at a universal bibliography of works about engraving would soon become obsolete or incomplete.

(P. G. H.)

ENGUERA, a town in the province of Valencia, in Spain, is situated in a mountainous district 32 miles S.S.W. of Valencia and 12 miles W.N.W. of San Felipe. Olives and mulberries abound in the surrounding country. In the town there are a convent and a hospital. It possesses woollen mills, and has also a considerable general trade. Population, 5700.

ENGUICHE, a term used in heraldry; as, for instance, a hunting-horn, in which the rim around the mouth is of a different color from that of the horn itself, is said to be *enguiche* of that color.

ENGYUM, or ENGUINUS, in ancient geography, a town on the head-waters of the Monalus, in the interior of Sicily, famous for its temple to Cybele, the "great mother of the gods." Though said to have been colonized by a company from Crete under the leadership of Minos, it was originally a town of the ancient Siculi. Its modern name is Gangi.

ENKHUIZEN, a seaport town of the Netherlands, in the province of North Holland, situated on the Zuyder Zee, 28 miles N.N.E. of Amsterdam. Its principal buildings are the town-house, the *Wester-Kerk*, the orphanage, the church of the Old Catholics. The town-house, erected in 1588, is adorned with allegorical paintings by Gerard de Lairesse, Houbraken, and Van Neck; one of its chambers is hung with fine tapestry of Louis XIV.'s time, and the burgomaster's room contains a *chef d'œuvre* by Ferdinand Bol. The industrial establishments comprise a foundry, several sugar refineries, and one of the largest factories in Europe for the manufacture of buoys; and there is a trade in wood, butter, and cheese. At the beginning of the seventeenth century the town numbered 40,000 inhabitants, and sent 400 vessels to the herring fishery; but the harbor is now rendered nearly useless by accumulations of sand, the fishing smacks do not number more than a dozen, and the population in 1869 was only 4925.

The nucleus of Enkhuizen was formed by a few houses (Enkelebuizen) built about 1000 A.D., and it was still an open village in 1279. In spite of numerous military vicissitudes, and a great flood which happened in 1514, it rapidly advanced, and under Spanish rule became a strongly fortified and beautifully built town. It was, however, the first of the cities of Holland to open its gates to William the Silent, in 1572. During the 17th century it began to decay, and in the 18th it sank to its present position.

ENLISTMENT, as defined in the Annual Mutiny Act (39 Vict. c. 8), consists in the recruit answering the questions put by the person authorized to recruit or to enrol under the Reserve Force Act or to enlist under the Militia Reserve Acts, and in his accepting the enlisting money with the accompanying notice. The recruit is then entitled to be billeted, and must, in not less than twenty-four and not more than ninety-six hours, appear before a magistrate (who is not a military officer) to be attested as a soldier or to object to his enlistment. If the recruit objects and satisfies the magistrate that the enlistment was irregular, he is discharged, and the matter reported to the military authorities; if the recruit objects, but the enlistment was regular, he must repay the enlisting money and any pay or allowances he may have received, and 20s. of smart money, and is then discharged. If the recruit does not object, or cannot pay the money, the questions in the form of attestation are again put by the magistrate, who also administers the oath of allegiance. If the recruit does not appear, he may be punished as a rogue or vagabond. Before this attestation the recruit is not subject to court-martial, but fraudulent conduct followed by attestation is punished either by the justices of the peace or by the district or garrison court-martial. Every attempt by an undischarged soldier or volunteer to re-enlist is punishable as desertion; but in the case of militiamen the penalty is generally a stoppage of 1d. or 2d. of weekly pay for a certain period. It is from the date of attestation that the period of service for pension or discharge runs. The above provisions apply to enlistment in the United Kingdom of natural-born subjects. The Mutiny Act makes special provision for enlistment abroad and for the enlistment of negroes or colored persons who are not subjects of Her Majesty by birth, or who have been condemned as prize under the Slave Trade Acts. A master wishing to recover an apprentice or indentured laborer who has enlisted must claim him within a month after enlistment. The apprentice is not only punished for wrongful enlisting, but remains liable to serve in the army at the end of his apprenticeship, and indeed may be punished as a deserter if he does not deliver himself up as a recruit. Much the same rules will be found in the Marine Mutiny Act. The enlistment oath for the militia is contained in the Militia Service Act, 36 and 37 Vict. c. 68. The period of service implied in enlistment is now regulated by the Army enlistment Act, 1870, 33 and 34 Vict. c. 67, repealed as regards compulsory *general* enlistment by the Mutiny Act, 1876. Long service is always for twelve years. Short service in the cavalry, artillery, and engineers is eight years army and four years reserve; in the infantry and army service corps, six years army and six years reserve. For the army hospital corps and the colonial corps there is no short service. In 1870 it was said that this scheme would require 322,449 recruits annually, and that in eight years a reserve of 81,811 would be created. The average enlistment is only about 20,000, but this is largely accounted for by the inducements given to enter the militia. In early times attendance at the *posse comitatus* was enforced by the penalty of *culvertage*, or turntail, viz., forfeiture of property and perpetual servitude. The organization of this levy will be found in the Assize of Arms (27 Hen. II.) and the Statute of Winchester (13 Edw. I.), which apply to all men between the ages of fifteen and sixty. By a later Act (4 and 5 Philip and Mary), commissioners of musters were appointed. When the feudal system of escuage was on the wane, Edward III. introduced a custom of "indenting" with private persons to furnish soldiers at certain rates of wage. Many of such indentures of Henry V.'s time, printed in Hunter's *Critical and Historical Tracts*, vol. i., appear to be agreements for one year in consideration of *gages et regards*, or pay and bounty at certain rates, 6d. a day for an archer and 1s. for a man at arms. The parties agree about sharing the *gaignes de guerre*, prisoners and booty. A quarter's wages, called *prest money*, is paid in advance. Not till the time of Henry VII. was "coat and conduct money" added to this mere bounty on joining. From time to time general pardons were given to all felons who would serve in the army, and even so late as 1703 a statute freed all insolvent debtors who would serve. The Welsh, Cornish, and Irish made up a large proportion of the recruits of the early English armies. (See also ARMY, vol. ii. p. 502.)

ENNIS, a municipal and parliamentary borough and market-town of Ireland, the capital of the county of Clare, province of Munster, is situated on the Fergus, about 25 miles W.N.W. from Limerick, with which town and Athenry it is connected by railway. Ennis has breweries, distilleries, and extensive flour mills; and in the neighborhood there is a valuable limestone quarry. The principal buildings are the Roman Catholic chapel, which is the cathedral of the diocese of Killaloe; the parish church, formed out of the ruins of the Franciscan abbey, founded in 1240 by Donogh Carbrac O'Brien; the court-house, a nunnery, and a school on the foundation of Erasmus Smith. On the site of the old court-house a colossal statue in white limestone of Daniel O'Connell was erected in 1865. The interesting ruins of Clare Abbey, founded in 1194 by Donell O'Brien, king of Munster, are half-way between Ennis and the village of Clare Castle. Ennis returns a member to Parliament. Population in 1871, 6503.

ENNISCORTHY, a market-town of Wexford county, Ireland, 13 miles N.N.W. of Wexford, on the side of a steep hill above the Slaney, which here becomes navigable for barges of a large size. It is on the line of railway between Dublin and Wexford. It possesses tanneries, breweries, flour mills, a woollen factory, and a distillery. Enniscorthy was taken by Cromwell in 1649, and in 1798 was stormed and burned by the rebels, whose main forces encamped on an eminence called "Vinegar Hill," which overlooks the town from the east. The old castle of Enniscorthy, a massive square pile with a round tower at each corner, is one of the earliest military structures of the Anglo-Norman invaders. Population in 1871, 5594.

ENNISKILLEN, a municipal and parliamentary borough and market-town of Ireland, capital of the county of Fermanagh, province of Ulster, is situated on an island in the strait or river which connects the upper and lower lakes of Lough Erne, 102 miles N.W. from Dublin and 22 miles from Clones by railway. The town occupies the whole island, and is connected with two suburbs on the mainland on each side by two bridges. It has a brewery, two tanneries, and a small manufactory of cutlery, and a considerable trade in corn, pork, and flax. The chief public buildings are the parish church, the Roman Catholic chapel, the Presbyterian and Methodist meeting houses, the county court house, the town-hall, the royal school founded by Charles I., and the infirmary. In 1689 Enniskillen defeated a superior force sent against it by James II.; and part of the defenders of the town were subsequently formed into a regiment of cavalry, which still retains the name of the Enniskillen Dragoons. The town returns a member to parliament. Population in 1871, 5836.

ENNIUS, Q. Although Ennius is known to us only from fragments of his writings and from ancient testimony, yet there is sufficient evidence from both sources to justify us in assigning to him a position of great eminence and influence in Roman literature. Although not the creator of that literature, for he is later in date, not only than Livius Andronicus and Nævius, but than Plautus, yet he did more than any of the early writers to impart to it a character of serious elevation, and thereby to make it truly representative of Rome. The influence of Nævius was little felt by subsequent writers; and, although the works of Plautus have enjoyed a happier fortune than those of Ennius, yet Latin comedy was essentially an exotic product, and stood in no direct relation to Roman life, nor to the deepest and most permanent moods of the national mind. On the other hand, both Lucretius and Virgil may be regarded as inheriting the spirit of Ennius; and in many fragments of his various works we recognize his affinity with the genius of Roman history, oratory, and satire.

The circumstances of his life naturally fitted him to become the chief medium of contact between the art and intelligence of Greece and the practical energy and commanding character of Rome. He was born among the Calabrian mountains ("Calabris in montibus ortus") in the small town of Rudiæ, in the year 239 B.C., one year after the date of the first dramatic representation of Livius Andronicus, and two years after the end of the first Punic war. Oscan was the language of the district in which Rudiæ was situated; but, as it is called by Strabo ῞Ελληνις πόλις, and as Ennius is spoken of as "semi-Græcus," Greek was probably the language in common use among the cultivated classes. Since the subjugation of Italy, and the settlement of Roman and Latin colonies in the conquered districts, the knowledge of Latin must have been spread among the allies who sent their contingents to the Roman armies. Ennius testified to his appreciation of the intellectual gain derived from the possession of various languages by using, in reference to his knowledge of Oscan, Greek, and Latin, the expression that "he had three hearts," (Gell. xvii. 17), the word "cor" being used by him, as by many other Latin authors, as the seat of intelligence. Through the access which these languages gave to the ideas and sentiments of which they were the organs, Ennius was able to combine the culture of Greece, the fresh feeling and inspiration of Italy, the elevated mood and "imperial patriotism of Rome," in laying the strong foundation of the national literature.

He is said (Serv. on *Æn.* vii. 691) to have claimed descent from one of the legendary kings of his native district, the "Messapus equum domitor" who is introduced by Virgil (in recognition of the poetical fame of his reputed descendant) as coming to the gathering of the Italian clans accompanied by his followers, chanting their native songs,—

> "Ibant æquati numero regemque canebant."

This consciousness of ancient lineage is in accordance with the high self-confident tone of his mind, with his sympathy with the dominant genius of the Roman republic, and with his personal relations to the members of her great families. The exemption from war which his native district enjoyed during the first twenty years of his life afforded him leisure to acquire the culture which he turned to use in later life; and the vicinity of Tarentum afforded him favorable opportunities for familiarizing himself with the dramatic art of Greece. But of his early years nothing is directly known, and we first hear of him in middle life as serving, with the rank of centurion, in Sardinia, in the year 204 B.C., where he attracted the attention of the Quæstor Cato, and was taken by him to Rome in that year. This personal service in the second Punic war, the most momentous struggle in which Rome was ever engaged, must have deepened his interest in the national fortunes, and contributed to that knowledge of men, and especially of the soldierly character, which was afterwards largely displayed in his epic and dramatic poetry. As Cato made it a reproach to M. Fulvius Nobilior that he had taken Ennius, after he became known as a poet, along with him in his Ætolian campaign (Cicero, *Tusc. Disp.*, i. 2), we may perhaps infer that it was the personal qualities of the man rather than the genius or culture of the poet which recommended the Messapian soldier to his regard.

From the time of his arrival in Rome till his death in 169 B.C., he devoted himself actively to various kinds of literary production, and probably to giving instruction in Greek, for which a great demand existed among the families of more liberal ideas among the Roman aristocracy. He lived on the Aventine, "in a plain and simple way, attended only by a single maid-servant" (to quote the words of Jerome in his continuation of the Eusebian Chronicle), and enjoying the friendship of the foremost men in the state, such as the great Scipio and M. Fulvius Nobilior, the conqueror of Ætolia. So strong was the bond of friendship which united him to the former of these men, that a bust of the poet was placed after death in the tomb of the Scipios, between those of the conqueror of Hannibal and the conqueror of Antiochus. He accompanied M. Fulvius Nobilior in his Ætolian campaign, in the year 189 B.C., and was present at the capture of Ambracia, which formed the subject of one of his dramas. The representation of this drama probably took place at the celebration of the general's triumph two years later. Through the influence of his son, the poet obtained the privilege of Roman citizenship, a fact commemorated by him in a line of the *Annals*—

> "Nos sumu' Romani qui fuvimus ante Rudini."

He died at the age of 70, immediately after producing the tragedy of *Thyestes*. In the last book of his epic poem, in which he seems to have given various details of his personal history, he mentions that he was in his 67th year at the date of its composition. He compared himself, in contemplation of the close of the great work of his life, to a gallant horse which, after having often won the prize at the Olympic games, obtained his rest when weary with age. A similar feeling of pride at the completion of a great career is expressed in the memorial lines which he composed to be placed under his bust after death,—"Let no one weep for me, or celebrate my funeral with mourning; for I still live, as I pass to and fro through the mouths of men."

From the impression stamped on his remains, and from the testimony of his countrymen, we think of him as a man of a robust, sagacious, and cheerful nature (Hor. *Ep.* ii. 1, 50; Cic. *De Sen.* 5) of great industry and versatility; combining imaginative enthusiasm and a vein of religious mysticism with a sceptical indifference to popular beliefs and a scorn of religious imposture; and tempering the grave seriousness of a Roman with a genial capacity for enjoyment (Hor. *Ep.* i. xix. 7). We may realize the nature of his relation to such men as Fulvius Nobilior, and his personal bearing towards them, by a passage quoted from his *Annals* (Gell. xii. 4), in which he is said, on the authority of the grammarian Ælius Stilo (a contemporary of Lucilius, and one of Cicero's teachers), to have drawn his own portrait under the figure of a confidential friend of the Roman general Servilius. This friend is introduced as being sent for by Servilius during a battle, and is described as one "whom he (Servilius) gladly made the sharer of his table, his talk, and his cares, when tired out with speaking on great affairs of state in the broad forum and august senate,—one with whom he could frankly speak about serious matters or jest about trifles,—to whom he could safely confide all that he cared to utter, with whom he had much hearty entertainment alone and in society,—one whose nature could never be prompted to any baseness through levity or malice,—a learned, loyal, pleasant man, contented and cheerful, of much tact and courtesy, choice in his language, and of few words, with much old buried lore, with much knowledge of men and much skill in divine and human law,—who knew well when to speak and when to be silent.

His career as a writer began at a great epoch of the national life, the end of the second Punic war. The self-confident and triumphant spirit produced by the successful result of that struggle may be discerned in the exuberant vitality and animal spirits of the comedies of Plautus, whose period of most vigorous production falls in the years between the end of the war and his death in 184 B.C. More nearly contemporary with Ennius was Cæcilius Statius, the Insubrian Gaul, whom Roman critics ranked as a greater comic dramatist than Plautus or Terence. If weight may be attached to the phrase in which Horace repeats the criticism of the Augustan age,—

"Vincere Cæcilius gravitate"—

he must have resembled him in temper also more than the older dramatists. Till the appearance of Ennius, Roman literature, although it had produced the epic poem of Nævius and some adaptations of Greek tragedy, had been most successful in comedy. Nævius and Plautus were men of thoroughly popular fibre. Nævius suffered for his attacks on members of the aristocracy, and, although Plautus carefully avoids any direct notice of public matters, yet the bias of his sympathies is indicated in several passages of his extant plays. Ennius, on the other hand, was by temperament in thorough sympathy with the dominant aristocratic element in Roman life and institutions. Under his influence literature became less suited to the popular taste, more specially addressed to a limited and cultivated class, but at the same time more truly expressive of what was greatest and most worthy to endure in the national sentiment and traditions. With the many-sided activity which characterized him, he attempted comedy, but with so little success that, in the canon of Volcatius Sedigitus, he is mentioned, solely as a mark of respect "for his antiquity," tenth and last in the list of comic poets. The names of only one or two of his comedies are known. He may be regarded also as the inventor of Roman satire, in its original sense of a "medley" or "miscellany," although it was by Lucilius that the character of aggressive and censorious criticism of men and manners was first imparted to that form of literature. The word "satura" was originally applied to a rude scenic and musical performance, exhibited at Rome before the introduction of the regular drama. The saturæ of Ennius were collections of writings on various subjects, and written in various metres, and contained in four or, perhaps, six books. Among these were included metrical versions of the physical speculations of Epicharmus, of the gastronomic researches of Archestratus of Gela ("Heduphagetica"), and, probably, of the rationalistic doctrines of Euhemerus. It may be noticed that all these writers whose works were thus introduced to the Romans were Sicilian Greeks. Original compositions were also contained in these saturæ, and among them the panegyric on Scipio, to which Horace refers in the phrase "Calabræ Pierides" (*Od.* iv. 8, 22). The satire of Ennius seems to have resembled the more artistic satire of Horace in its record of personal experiences, in the occasional introduction of dialogue, in the use made of fables with a moral application, and in the didactic office which it assumed.

But the chief distinction of Ennius was gained in tragic and narrative poetry. He was the first to impart to the Roman adaptations of Greek tragedy the masculine dignity, pathos, and oratorical fervor which continued to animate them in the hands of Pacuvius and Accius, and which, when set off by the acting of Æsopus, called forth vehement applause in the age of Cicero. The titles of about twenty-five of his tragedies are known to us, and a considerable number of fragments, varying in length from a few words to about fifteen lines, have been preserved. These tragedies were for the most part adaptations, and in some cases, translations from Euripides. One or two were original dramas, of the class called "prætextatæ," *i.e.*, dramas founded on Roman history or legend. The heroes and heroines of the Trojan cycle, such as Achilles, Ajax, Telamon, Cassandra, Andromache, were prominent figures in some of those adapted from the Greek. Several of the more important fragments are found in Cicero, who expresses a great admiration of the manly fortitude or dignified pathos ("O poëma tenerum et moratum atque molle") of the passages which he quotes. Although it is more difficult to judge, from unconnected fragments, of the genius of a dramatic than of any other kind of poet, yet in these remains of the tragedies of Ennius we can trace indications of strong sympathy with the nobler and bolder elements of character, of vivid realization of impassioned situations, and of sagacious observation of life. The frank bearing, fortitude, and self-sacrificing heroism of the best type of the soldierly character find expression in the persons of Achilles, Telamon, and Eurypylus; and a dignified and passionate tenderness of feeling makes itself heard in the lyrical utterances of Cassandra and Andromache. The language is generally nervous and vigorous, occasionally vivified with imaginative energy. But it flows less smoothly and easily than that of the dialogue of Latin comedy. It shows the same tendency to aim at effect by alliterations, assonances, and plays on words. The rudeness of early art is most apparent in the inequality of the metres in which both the dialogue and the "recitative" are composed.

But the work which gained him his reputation as the Homer of Rome, and which called forth the tribute of affectionate admiration from Cicero and Lucretius, and that of frequent imitation from Virgil, was the *Annales*, a long narrative poem in eighteen books, containing the record of the national story from mythical times to the years during which the poem was written. Although the whole conception of the work implies that confusion of the provinces of poetry and history which was perpetuated by later writers, and especially by Lucan and Silius, yet it was a true instinct of genius to discern in the idea of the national destiny the only possible motive of a Roman epic. The execution of the poem (to judge of it by the fragments, amounting to about six hundred lines, which have been preserved), although rough, unequal, and often prosaic, seems to have combined the realistic fidelity and freshness of feeling of a contemporary chronicle with the vivifying and idealizing power of genius. He prided himself especially on being the first to form the strong speech of Latium into the mould of the Homeric hexameter. And although it took several generations of poets to beat their music out to the perfection of the Virgilian cadences, yet in the rude adaptation of Ennius the secret of what ultimately became one of the grandest organs of literary expression was first discovered and revealed. The inspiring idea of the poem was accepted, purified of all alien material, and realized in artistic shape by Virgil in his national epic. He deliberately imparted to that poem the charm of antique associations by incorporating with it much of the phraseology and sentiment of Ennius. The occasional references to Roman history in Lucretius are evidently reminiscences of the *Annals*. He as well as Cicero speaks of him with pride and affection as "Ennius noster." Of the great Roman writers Horace had least sympathy with him; yet he testifies to the high esteem in which he was held during the Augustan age. Ovid expresses the grounds of that esteem when he characterizes him as

"Ingenio maximus, arte rudis."

A sentence of Quintilian expresses the feeling of reverence for his genius and character, mixed with distaste for his rude workmanship, with which the Romans of the early empire regarded him:—"Let us revere Ennius as we revere the sacred groves, hallowed by antiquity, whose massive and venerable oak trees are not so remarkable for beauty as for the religious awe which they inspire." (*Inst. Or.* x. i. 88). From his own application of the epithet "sanctus" to poets, which may be compared to the application by Lucretius of the same word to the great discoveries in philosophy, and to the "pii vates" of Virgil, we may learn something of the earnest spirit in which he wrote for his countrymen the great story of their fathers' deeds.

"Aspicite, O cives, senis Enni imagini' formam;
Hic vestrum panxit maxima facta patrum."

The best edition of his fragments is that of Vahlen, published in 1854. The remains of his tragedies are edited also in Ribbeck's *Tragicorum Latinorum Reliquiæ*, published in 1852. These remains are critically discussed in the *Römische Tragödie* of the same author, published in 1875. (W. Y. S.)

ENOCH. Four persons of this name are mentioned in the Old Testament Scriptures. The first was the eldest son of Cain, who called a city which he built by the same name as his first-born (Gen. iv. 17). In the English Authorized Version Enoch appears, in the form *Hanoch*, as the name of the eldest son of Reuben (Gen. xlvi. 9) and of a son of Midian (Gen. xxv. 4). The name is most familiar, however, as that of the son of Jared and the father of Methusaleh, whose life is told in Gen. v. 18–24, and further illustrated in Heb. xi. 5. The evident meaning of the two passages taken together is that Enoch, after a life of close intercourse with the spiritual world, which lasted for 365 years, was translated to heaven without dying. The symbolic meaning of the numbers connected with his life has not escaped notice. He was "the seventh from Adam" (Jude 14), and this has been held to typify his perfection. On the fact that his years are the same in number as the days of an ordinary solar year, a mythical interpretation of the story of his life has been offered which seems more ingenious than sound. According to this, Enoch is the god of the new year. The year "is not" at the end of 365 days, but is immediately renewed. Enoch's chief importance in Old Testament history consists in the fact that along with Elijah he is a palpable witness to the doctrine of immortality. Later traditions, founded probably on the apocryphal book which bears his name, represent him as the inventor of arithmetic and astronomy. On the book of Enoch, see APOCALYPTIC LITERATURE, vol. ii. p. 153.

ENOS (the ancient Ænos), a seaport town in the metropolitan province of European Turkey, vilayet of Adrianople and sandjak of Gallipoli, is situated on the south side of the Gulf of Enos, 38 miles N.W. of Gallipoli and 80 miles S.W. of Adrianople. It is connected with Adrianople by the river Maritza, and for a long time has been its principal seaport; but on account of its harbor having become partially choked by a sandbank, and the fact that Adrianople is now connected by rail with the neighboring port Dédé-Agatch, its trade is gradually declining. The deposits which have accumulated in the harbor are the cause of fevers, which at certain periods almost decimate the population. Population about 7000.

ENRIQUEZ GOMEZ (ANTONIO), the name finally adopted by a Spanish dramatist and poet, who was the son of Don Diego Enriquez Villanueva, a converted Portuguese Jew, and during the first part of his public life was known as Enrique Enriquez de Paz. He was born in Seville, probably between 1600 and 1602, and obtained a classical education. His twentieth year was hardly out when he entered the army, and his military services procured him, not only the rank of captain, but also admission into the Portuguese order of San Miguel de Avis. About 1629 a number of comedies from his pen were represented in the theatre of Madrid, the *Cardenal de Albornoz* and *Fernan Mendez Pinto* being especially applauded; and he was probably still in the capital in 1635, when there appeared his *Fama póstuma á la vida y muerte de Lope de Vega*. Fear of persecution on account of his suspected Jewish proclivities seems to have led him to leave Spain in 1636; and in 1638 we find him in France, where he remained for eleven years, became councillor and majordomo to Louis XIII., and continued assiduously to write and publish. Shortly after 1656 he settled in Amsterdam, and in the religious tolerance of that city made open avowal of his Judaism, and thus had the honor of appearing in effigy in the great *auto-da-fe* celebrated in Seville on April 14, 1660. The date of his death is not known, but it was probably not many years later. He had at least one son, Diego Enriquez Basurto, who in 1649 published at Rouen *El triumpho de la virtud y paciencia de Job*. As a writer Enriquez is characterized by ready invention and a "fatal facility" of execution; and especially in his later works his style is full of extravagances. His *Academias morales de las Musas*, Bordeaux, 1642, contains, besides three other comedies, *A lo que obliga el honor*, which was the foundation of Calderon's *Medico de su honor*. *El siglo pitagorico y vida de don Gregorio Guadaña*, Rouen, 1644, 1647, and 1687 (reprinted at Brussels by F. Foppens in 1727, and by Rivadeneyra in tom. xxxiii. of his *Biblioteca de Autores españoles*), is a series of satirical sketches in prose and verse, which partake of the character of the picaresque romance. *La culpa del primer peregrino* (Rouen, 1644; Madrid, 1735), a mystical poem; *Louis dado de Dios á Anna* (Paris 1645), presenting the author's views on political matters; *Politica Angelica* (Rouen, 1647); *La torre de Babilonia* (Rouen, 1647; Madrid, 1670), containing the two parts of *Fernan Mendez Pinto; Samson Nazareno*, a heroic poem; and several comedies not mentioned above, complete the list of Enriquez's acknowledged writings. Adolfo de Castro, however, in his notes to *Gil Blas*, advanced the opinion that the comedies usually attributed to Fernando de Zarate were really the production of Enriquez Gomez, who had merely adopted the shelter of a pseudonym to facilitate the introduction of his works into Spain. His principal authority was the following entry in the *Index Expurgatorius:* "Don Fernando de Zarate (is Antonio Enriquez Gomez)—His comedy, *El capellan de la Virgen, San Ildefonso*, is prohibited;" and the fact that almost nothing was known about Zarate lent a strong show of probability to his theory. The matter has since been eagerly debated. Mesonero Romanos, editor of vol. i. of the *Dramaticos posteriores á Lope de Vega* (*i. e.*, vol. xlvii. of Rivadeneyra's *Biblioteca*), though at first he adopted Castro's opinion, has since become its vigorous opponent; and Barrera makes out a very strong case in favor of the historical individuality of Zarate, alleging, among other arguments, that the subjects of the plays ascribed to him, *El gran sepulcro de Cristo, Santa Maria Magdalena*, etc., are not such as were likely to be treated in his later years by the Jewish poet, that autograph manuscripts of Zarate exist in various collections, and that the style and methods of the two writers are perceptibly distinct.

ENSCHEDE, a town in the Overyssel province of Holland, is situated near the Prussian boundary, about 45 miles S.E. of Zwolle, at the junction of three railways. Its principal industry is the spinning and weaving of cotton, in which six spinning mills and thirteen steam-power looms are employed. Two-thirds of the town was destroyed by fire on the 7th May, 1862, but was very soon rebuilt. Population in 1875, 5291.

ENTAIL (from *tailler*, to cut) really means a limited succession—one cut out by the will of the maker of the entail from the ordinary legal course of succession. The derivation of the word from *talis* (tales hæredes qui in tenore investituræ continentur) is now abandoned. But, as an existing social institution, entail has also generally involved more or less restriction on the proprietary powers of the heirs succeeding to the subject of entail. The policy of entails has therefore been keenly discussed.[1] The attempt to settle the matter on legal principles entirely failed. On the one hand, in the language of the civil law, *unusquisque est rei suæ moderator at arbiter*. This was said to imply an unlimited right to dictate the conditions on which an estate was to be enjoyed after the death of its owner. On the other hand, it was argued that on death the ownership must change, and that the restrictions imposed on heirs of entail were inconsistent with the nature of property. These legal conceptions are themselves merely the products of different states of society. A powerful and learned writer[2] has recently shown that the notion of absolute and exclusive private property is of quite modern date; and it may be added that the power of testamentary disposition was unknown in primitive times, and has only been very gradually admitted. In most civilized countries, so far as concerns the creation of perpetuities, it is now being curtailed in obedience to those considerations of social expediency which alone can decide the question of entails. Conservative philosophers have maintained that the hope of founding a family and an estate which will together be immortal is so great an incentive to the higher forms of industry that the state cannot afford to do without it. But the irresistible answer is that if you give this powerful motive to the founder of a perpetuity, you take it away from every suc-

[1] See J. R. M'Culloch's note xix. to his edition of *Wealth of Nations*, 1828, afterwards republished as *Treatise on the Succession to Property vacant by Death*, London, 1848.

[2] M. de Laveleye, in his *De la Propriété et de ses formes primitives*, Paris, 1874.

ceeding generation of his descendants. They are born to wealth which their idleness will not dissipate, and possibly to social distinction which has not been earned by their exertions. Besides, it is not disputed that perpetuities are opposed to the interest of the state in the annual produce of the soil, which they place *extra commercium.* These evil consequences of entails have been vividly described by Blackstone[1] in a passage borrowed without acknowledgment from Bacon:[2]—"Children grew disobedient when they knew they could not be set aside; farmers were ousted of their leases made by tenants in tail; for, if such leases had been valid, then under color of long leases the issue might have been virtually disinherited; creditors were defrauded of their debts; for if tenant in tail could have charged his estate with their payment, he might have also defeated his issue by mortgaging it for as much as it was worth; innumerable latent entails were produced to deprive purchasers of the land they had fairly bought—of suits in consequence of which our ancient books are full; and treasons were encouraged—as estates-tail were not liable to forfeiture longer than for the tenant's life." It is, indeed, obvious that, even if we assume heirs of entail as a class to have been keenly alive to the duties or the true interests of ownership, they had no power to improve their estates or to assist their tenants in doing so. But even if entailed estates were managed so as to yield the greatest possible amount of produce, it would still be a misfortune, and a complete answer to the argument we have been considering, that the land, so far as entailed, would be beyond the most ambitious hopes of the mercantile and manufacturing community. Perpetuities have, however, been defended on the perfectly distinct principle, not economical (in the narrower sense), but broadly political, that they are essential to the permanent well-being of an aristocracy. It is impossible here to discuss the advantages resulting from the existence of an aristocratic caste, whether invested with the hereditary privilege of legislation or regarded merely as contributing to political life an element of safety and independence and culture and historical continuity. These advantages, if they be facts, do not seem to be necessarily connected with any particular system of land-laws, and in certain circumstances a system of perpetuities might possibly impoverish and degrade a real aristocracy. But it is certainly true that in the past the two institutions are found in very close connection. Perhaps, in this view, the earliest type of an entail occurs when, out of the common property of a tribe or other primitive organization, some lands are given to a family who hold a public office or exercise definite hereditary functions. In later times the connection is sufficiently illustrated by the Carlovingian institution of *majoratus*, which spread through France and Italy and Spain, and which, like so many other Carlovingian ideas, was reproduced by Napoleon in the tawdry magnificence of the imperial decrees of 1808.[3] The strong feeling which associates the land with its hereditary owners has found expression in the well-known lines—

> "Shades that to Bacon could retreat afford
> Become the portion of a booby lord,
> And Hemsley, once proud Buckingham's delight,
> Slides to a scriv'ner and a city knight."

Hence, also, the various suggestions which have been made of a downward and an upward limit to the property which should be required for a lawful entail of certain dignities. In his essay on *Popular Discontents* Sir William Temple proposed, and Dr. Johnson applauded the proposal, that every baron should have at least £4000, every earl £6000, and every duke £8000 worth of land. This idea has frequently been realized in practice. In Prussia an entail was incompetent except of subjects above £400 in net annual value; in Denmark the estate must be at least 200 tönder of hard corn, or 2000 acres in extent; and under the Napoleonic system the *dotation* of the proposed entail, whether proceeding from the Government or from the applicant himself, was always carefully fixed by the *Conseil du sceau des titres*, with reference to the title or dignity which it was intended to preserve. A prince of the imperial blood or a grand dignitary was entitled to call his house a *palais*, princes of the empire and dukes had to content themselves with *hôtel*, and so on. The same principle appears in the canon of construction laid down by the old Italian law, that a majoratus of such subjects as palatium, turris, castrum, and even ædificium was easily presumed.[4] Indeed, kingdoms have been the subject of entail, and thus the law of entail has supplied the key to more than one political situation. Such was the great controversy "de vanitate hæredum regredientium," whether according to the doctrine of reversion or *regredient-erben*, on the failure of heirs male, and in the absence of any *pactum confraternitatis* taking the estate to another family, a fee-simple estate remained in the last substitute, or whether the estate returned to the heirs of the entail. This question arose in 1790 between Maria Theresa and the elector of Bavaria; the former was victorious by force of arms against the general opinion of lawyers. It was also discussed all over Europe in the Hochsteden case. The crown of Spain was the type of the regular mayorazgo in that country—the inalienable estates descending to the eldest and nearest heir by blood (natu major), with right of representation and without preference of males. Again, the relation between the crown and the entailed estates of subjects has produced a number of elaborate rules with respect to the *justæ causæ* of interference by the state, and has thus profoundly influenced the history of Europe. An Italian majoratus, for instance, might include such subjects as jus honorificum, patronatus, commenda militaris, feudum habens administrationem: from all these monks were by the common law excluded; and all of them were forfeited to the fisc, either absolutely or for a time, by the blasphemy, heresy, or treason of the heir in possession. The entail, therefore, has always been much more than a family settlement or a system of land tenure. In modern Europe there have not been many forms of hereditary aristocracy without some form of entail. But it by no means follows that the influence of perpetuities upon the aristocracy has been beneficial. The introduction of *post obit* bonds, and the law of England relating to the protection of infants against unconscionable bargains, suggest some reflections of a different kind. It will appear in this article that public opinion has generally condemned entails, and that they are being rapidly abolished throughout Europe.

The speeches of Isæus and Demosthenes show that in Greece many difficult questions had risen with regard to the power of a testator to substitute one heir after another; but the earliest definite legal forms of entail were those which appeared under the later Roman law relating to *fidei commissa*, or trusts. The fidei commissum was originally a trust conveyance introduced for the purpose of evading such disabilities as the lex Voconia imposed on women to take directly under a will. The trustee, or *fiduciarius*, was after the time of Augustus liable in a personal action at the instance of the beneficiary, or *hæres fiduciarius.* This form, however, was soon converted into a long nomination or substitution of heirs, to which clauses prohibiting alienation were added. The most common clauses were such as "ne eum fundum vendatis," "ne ex nomine familiæ alienaretur." One well-known form also prohibited mortgages, and emphatically declared that the settled estates should remain "firmas meis filiis et nepotibus *per universum tempus*," and that all contrary deeds should be void and null. On this deed Scævola expressed the opinion that a security over the rents was not a contravention.[5] For some centuries the law recognized such entails as valid in perpetuity; but by Novel 159,[6] "Ut restitutiones in uno gradu subsistant," their validity was confined to the first four generations.

The *jus emphyteuticum* limited to *hæredes sui*, which was granted to *coloni*, formed the type of the tenure by hereditary lease, *bail héréditaire*, which is still common in Europe. Among others may be mentioned the *aforamento* of Portugal, in which the superior is named *directo senhor*, and the vassal or tenant *foreiro;* the *contratto di livello* and *beni libellari* of parts of Italy; the *emphiteusis transitoria ad quoscunque ex pacto et providentia concedentis*, the tenure of monastery lands, in the old Roman states; the *erbleihe* and *landsiedelgüter* of Bavaria ("allodified" in 1848); the *beklem-regt* of Gröningen, subject to the *propinen*, or fine, on renewal; the *erb-pacht* of several German districts; the *quevaises* and *domaine congéable* of the west of France; most of which, indeed, have become fee-simple estates, but were at one time inalienable. The differences between emphyteusis and feu are well brought out in an essay *De prohibita rerum alienatione*, by the Dutch jurist Sande, Leovardiæ, 1657. This and the tenure on which the *limitanei milites* held their *agri limitrophi* as a *subsidium adversus rebelles* naturally introduce us to the *feuda gentilitia* of the feudal law in which the benefice was granted out to a vassal and his heirs, who could not alienate without the superior's consent, because on the failure of these heirs the feu returned to the superior. Indeed, the vassal could not alter the succession; and hence, as Sir Thomas Craig observes, "sine superioris consensu vix talliæ locus esse potest."[1] The principle of limitation is here of course entirely opposed to that of the Roman law, which affirmed the right of a testator to name his heirs in perpetuity. It was a feudal maxim, "Solus Deus potest facere hæredem;"[2] and the limitations on the vassal's right arose, not from his own act, but from the reserved estate of superiority and the tenor of his charter in the lands. The feudal law also favored male heirs, and required that one heir only should succeed.

It appears from the laws of Alfred (c. 37), that entails were known before the Norman feudal law had been domesticated in England. "Si quis terram hæreditariam habeat, eam von vendat a cognatis hæredibus suis, si illi viro prohibitum sit, qui eam ab initio acquisivit, ut ita facere nequeat." These grants which could not be alienated from the lineage of the first purchaser were also known as *feuda conditionata*, because if the donee had no heirs of his body the estate reverted to the donor. This right of reversion being constantly evaded by a sale and repurchase on the birth of issue, the famous Statute of Westminster the Second, *de donis conditionalibus*, 13 Edw. I. c. 1, was passed, which provided that the will of the donor should be observed, and that no alienation by the donee should prevent the operation of the condition. Thus was created the fee-tail, or *feudum talliatum*, of English law—a strict and practically perpetual entail. The power of alienation was reintroduced by the judges in Taltarum's case (Year Book, 12 Edw. IV. 19) by means of a fictitious suit or recovery which had originally been devised by the regular clergy for evading the statutes of mortmain. A full account of the mysteries of præcipe and vouching, and of another fictitious process of fine (finalis concordia) and proclamation, will be found in Blackstone, ii. 7, and Mr. Knowler's argument in Taylor and Horde, 1 Burr. 60. These forms were abolished by an Act passed in 1833; and now every tenant in tail, at least while there is a possibility of issue, may bar even his issue by executing a deed and enrolling it in the Court of Chancery, but not by will. This right is available to creditors. The erroneous notion of *heir land*, however,—of something which must perpetually descend from father to son,—still lingers in some country districts of England. By the common form of marriage settlement, the eldest son and the other sons of the marriage are made tenants in tail. Where the parent or some other person enjoys a life interest under the settlement, he is called the protector of the settlement, and his consent is required to the barring of the entail by the first tenant in tail. Thus, except in the case of estates tail granted by the crown as a reward for public services (see 34 and 35 Hen. VIII. c. 20), land in England cannot now be tied up for a longer period than the lives of persons in existence and twenty-one years thereafter. The rigid law of forfeiture which was applied in the time of Henry VIII. to estates tail was repealed by the Act 33 and 34 Vict. c. 23, which provides that no conviction of treason or felony or verdict of *felo de se* shall cause any attainder or corruption of blood or any forfeiture or escheat.

In Scotland, where for several centuries feus remained inalienable beyond one-half of their extent, where the feudal aristocracy often violently resisted the approach of creditors or apprisers, and where the dawning of commerce was very late, statutory authority was not given to entails until the year 1685.[3] As Sir George Mackenzie said in one of his pleadings, "the honor of the country standeth more by ancient families than by merchants." The word entail, indeed, is often used before the 15th century, but generally in the sense of a simple destination alterable by every heir in possession. Thus Sir James Balfour informs us that "infefment of tailzie" is considered lawful and not prejudicial to the king's soul and conscience, and explains that the entail might at any time be broken by resignation in favor of heirs whomsoever. The earliest prohibition *de non alienando* occurs in 1489. After this it was attempted to protect the rights of substitute heirs by the diligences of inhibition and interdiction; and at last, in the early part of the 17th century, Sir Thomas Hope, who revised the Calderwood entail, introduced the well-known irritant and resolutive clauses, declaring void deeds in contravention of the entail and the right of the contravening heir. Cromwell, with his usual sagacity, appointed a committee to consider the legal destruction of entails; but in the celebrated Stormonth case in 1662, one of the clauses just mentioned was held to be valid at common law against creditors, who, however, had got notice of it from the title-deeds. Much doubt was felt about the soundness of this decision. The first Roxburgh entail had been addressed to the sovereign, as if to invoke special protection. The aristocracy were alarmed by the forfeitures for treason which took place under Lauderdale's administration; and accordingly the statute of 1685 was passed, which until 1848 remained the *foundation* of the Scotch law of entail. It adopts the style suggested by Hope (a prohibition of sales, mortgages, and alterations of succession, with irritant and resolutive clauses), and provides that if the deed of entail be recorded in the register of tailzies, and if notice of the conditions be also given in the titles of the estate, the entail is to have perpetual validity. The heir in possession remained nominally proprietor, but his powers of management were in reality not much more extensive than those of a life-renter. The statute applied to almost everything in the nature of a heritable subject. Jedburgh cross, for instance, was entailed; so was the office of heritable usher; even the smallest properties (*e.g.*, a lodging in Edinburgh, *pars tenementi* in Forfar, a single field in the Haughs of Clyde) were sometimes tied up. But it did not apply to the entails of money and household furniture, which had not been uncommon in earlier times. It has been well described as a "padlock on the plough;" and the security from forfeiture (except of the life-interest of the traitor) which the Scotch Estates fancied they had secured by the Act 1690 c. 33 was taken away by the Act 1708, c. 21, which attempted to assimilate the laws relating to treason in the two countries. The feudal maxim "tantum facit quis delinquendo quantum alienando" may have made rebellion more stubborn; but it is impossible not to agree with the Scotch statute, that "it is just that every man suffer for his own fault, and not the innocent with or for the guilty." The English law of forfeiture, on the other hand, proceeds on the Ciceronian principle "ut caritas liberorum amiciores parentes reipublicæ redderet" (*Ad Brutum*, 12).[4] The only interests saved from forfeiture under an English entail were those of remainder-men; but as a Scotch entail has no remainder-men, the forfeiture of Scotch estates was for a time complete. The judges and the commissioners of forfeited estates took very different and very warm views of the matter. After the first Jacobite rebellion, however, a compromise was effected in the case of Gordon of Park, according to which only the right of the traitor's issue was taken away. Meanwhile the entail system was found to weigh heavily on agriculture; the amount of litigation to assert or to control the rights of the proprietors was excessive; the judges, chiefly members of the aristocratic class, at first benignant towards perpetuities, had begun to apply those strict tests of language as distinguished from intention which have since furnished some of the most ludicrous and not the most creditable efforts of judicial interpretation; and at last, through the efforts of the Faculty of Advocates led by Mr. Lockhart, the Montgomery Act (10 Geo. III. c. 51) was passed, which gave some relief to heirs in possession in such matters as building and improving leases, expenditure on permanent improvements, and exchanges. It was followed after a long interval by the Aberdeen Act (5 Geo. IV. c. 87), which conferred powers of charging provisions to a limited amount for husbands, wives, and children; and after a select committee of the Commons had reported on the subject of Scotch entail (Par. Pap. vii. 1828), by the Rosebery Act (6 and 7 Will. IV. c. 42, amended by 1 and 2 Vict. c. 70, and 4 and 5 Vict. c. 24), which enlarged the powers of excambion, or exchange. The suggestion made in 1827 to throw entailed estates into judicial management by an action of cognition and sale was fortunately abandoned. In 1840 an Act (3 and 4 Vict. c. 48) permitted the granting of sites for churches, schools, manses, and teachers' houses. At last, an accomplished lawyer, Lord Rutherfurd, framed and passed the comprehensive Act (11 and 12 Vict. c. 36) which still bears his name, and which has abolished perpetuities in Scotland and introduced a system of greater freedom than that of strict settlement in England. This Act not only increases the power of charging entailed estates with improvement debts and provisions, of feuing, and of sale to pay off debt, but it introduces a right to disentail to be exercised for some time after the passing of the Act with certain consents, but which practically gives an estate in fee-simple to every entailed proprietor born after 1848. This Act, which also applies for the first time the principle of the Thellusson Act to land in Scotland, has been usefully enlarged by the following Acts—16 and 17 Vict. c. 94, 31 and 32 Vict. c. 84, and 38 and 39 Vict. c. 61,—the last of which contains a liberal definition of permanent improvements. In 1847 it was estimated that one-half of the land in Scotland was under entail; in 1827 the proportion was stated at one-third, the number of separate entails being about 1600. Since 1848, 616 deeds of entail, including re-entails, 435 instruments of disentail, and 105 deeds of excambion have been recorded (*Treatise on the History and Law of Entails in Scotland*, by E. D. Sandford, 2d ed. 1842; see also the text-books on conveyancing, minor works by Fergusson, Irvine, and Duff, and two essays by Lord Kames).[1]

From a very early time the Roman law of entail, or "substitution graduelle," was received in France. The very phrase of the digest, "ne de nomine exiret," was in common use. *Insinuation*, or recording in the books of a *Prévoté Royale*, or *Bailliage Royal*, was necessary to bind creditors. The institute, *grevé* (*gravatus*), could by a *hypothéque subsidiaire* charge the estate with a provision for his wife. In 1747 the Chancellor D'Aguesseau, after collecting the opinions of all the local parliaments on the subject, passed the Ordonnances of Orléans and Moulin, which prohibited perpetual substitutions, but permitted them for two degrees (see *Questions concernant les Substitutions*, 1770; also Pothier's *Œuvres Posthumes*, tom. v., and art. "Subs. Fidei-commissaire" in Merlin, xiii. 67). Substitutions of every kind were abolished by section 896 of the Code Napoléon, but at the same time, as was explained above, the emperor attempted to revive the system of majorats, or entails of subsidized dignities. He says his object is "non seulement d'entourer notre trône de la splendeur qui convient à sa dignité, mais encore, de nourrir au cœur de nos sujets une louable émulation, en perpétuant d'illustres souvenirs, et en conservant aux âges futurs l'image toujours présente des récompenses qui sous un gouvernement juste suivent les grands services rendus à l'état" (Imperial Decree of 1st March, 1808). All the dukes, barons, counts, and chevaliers, and the others who obtained majorats, had to make the following oath:—"Je jure d'être fidèle à l'empereur et à sa dynastie, d'obéir aux constitutions, lois, et règlemens de l'empire, de servir sa majesté en bon, loyal, et fidèle sujet, et d'élever mes enfans dans les memes sentimens de fidélité et d'obéissance, et de marcher à la défense de la patrie toutes les fois que le territoire sera menacé, ou que sa majesté, irait à l'armée." The estates of these majorats were subject to inspection by *agents conservateurs*. The mansion-house was to be at least 2 per cent. of the value of the estate. The later French laws relating to substitutions are those of 12th May, 1835, prohibiting all future substitutions, and 7th May, 1849.

It has already been pointed out that the Spanish crown was a majorat, subject to the quaint condition, *seyendo home para ello*, that the heir should be a fit and proper person. The inalienability of the domain of the sovereign (except to provide an apanage for the younger members of the reigning family) and of the greater peers was almost part of the common law of Europe (Sande, *De proh. rer. alien.*). But in Spain there was an unusual complexity of entails—regular and irregular, substantial and habitual, etc., varying with the elements of linea, gradus, sexus, and ætas. The *linea de agnacion limitada* was equivalent to the English tail male special. The *propriedad* was not forfeited for treason, except in cases of special enormity, as when the *Communeros* rose against Charles I. A unique species of entail is the *linea de qualidad*, confined to such as obtain a certain qualification, *e. g.*, doctor, etc. There was also the singular elective entail, in which a right to choose the heir was given to some one outside the family.[2] This resembles the patron of an Italian majorat. Sir Geo. Mackenzie mentions that in the original Dundas entail a discretionary power was given to friends (*Treatise on Taillies*). Wherever a title was connected with lands, the consent of the crown was required to the creation of a majorat. The principle of succession was that at every devolution the nearest heir to the original testator should be selected (proximitas gravantis non gravati).[3] In Italy a very similar state of matters existed; the Roman phrase "quia volo ut bona mea remaneant in familia mea" seems to have become words of style.

In Portugal the *prasos de vita*, or inalienable right of primogeniture for three generations, was abolished by the Act of 19th May, 1863.

Denmark still retains much more perfect entails. There the *sædegaard*, or family seat, including the *hovedgaard*, or manorial demesne, and the *bönder gods*, or portion occupied by small farmers, is frequently entailed either as (1) the *stamhuse*, a perpetual entail of both heritable and movable estate, which the crown sometimes graciously allows to be converted into money trusts, or (2) the 32 baronial fiefs all created since the establishment of absolute government in 1660, and which on failure of heirs revert to the crown.[4] Ever since the teaching of the economist Pontoppidan, followed up by the practical efforts of Bernstorff and Struensee, and in the present century by the agitation of the *Bondevenner*, or Radical Left of the Rigsdag, there has been a tendency to bring land more completely into commerce. The constitution of 1849, indeed, prohibits the creation of new entails. By Bishop Mourad's bill of 1861, drawn by the jurist Larsen, the powers of selling the entailed bönder gaarde were extended much beyond the principles of *fæstetvang*, or obligation to lease for two lives. Count Frijs and the landowners' party then began the voluntary conversion of the tenemented farms into freeholds: and in 1869 Hansen carried his expropriation bill, which prohibits new estates for life, and provides a machinery for compensation at the expiry of existing interests. In Sweden, although primogeniture and even favor to male issue is unknown, there are still entails, although no new ones can be created.

The old hereditary male fiefs, sanjak or beglik, *ziainet* and *timars*, originally granted by the Ottoman rulers, have now entirely disappeared. These grants were indivisible and inviolable, and formed a species of Government entail. The possessor of the beglik was in the Turkish-speaking provinces called dere-beg, lord of the valley; in the Arab districts (*e.g.*, Syria and Irak) he was called ameer, or governor. The *eraziye mirige*, or *imlak* (crown) lands, held from the crown, still require public authority for most acts of full ownership. (See the law of 7th Ramazan, 1274, or 19th April, 1857, which, slightly modified, forms at present the code of land-title in Turkey in Europe.) It is a fundamental principle of Mahometan law that all land belongs to the sultan as the gift of God, and is therefore to be used justly.

The land-legislation of Prussia during the present century is so often quoted that this sketch would not be complete without some reference to its provisions on the subject of entails. By the 5th clause of the edict of October 9, 1807, the practice of settling estates by hereditary leases (afterwards abolished) was continued, while the 9th clause provided that feudal entails and *fidei commissa* might be unsettled by family agreement. The Prussian *fidei commissum* may be constituted in every object of property yielding annual returns without waste of substance, and so an entail of certain movables is competent. The Prussian tenant for life can let on lease, and charge the land with annuities for his daughters, and can gratuitously dispose of his life-interest. The Hessian law compels him to charge the fee with provisions to his younger sons. The sale of useless land has always been permitted, but otherwise a public Act of expropriation must be got, or a decision of the whole family council. Two next heirs in remainder may, however, by their consent give effect to an exchange. The charges to which a *fidei commissum* is subject are the debts of the founder, expenditure by the tenant for the abolition of real charges, for embankment dues, flood-rates, rebuilding, and for bringing worn-out land again into cultivation. The succession is usually limited to male persons; and monks and dishonored persons are specially excluded. In the Rhine Provinces and many parts of North Germany, *fidei commissa* were abolished on the introduction of French law without compensation to the heirs in remainder. They were subsequently re-established, but the 38th section of the Land Rights of the German people (1848) provides —"*Fidei commissa* are to be abolished. The form and conditions of such abolition are to be determined by the legislation of each state." Distinct from *fidei commissa* there are in Germany many ancient customary entails, not usually restricted to male heirs, and terminable by agreement of the occupant with the next heir. There was also power to sell in circumstances of necessity subject to preemption by the next heir. Many of these estates rest on family "bye-laws."

---

[1] Acturial formulæ for the values of interests under entails will be found in *Considerations on Pecuniary Interests, etc.*, by Spencer Thomson, Edin., 1870. For the legal principles of valuation under the Act of 1875, see case of Wilson *v.* De Virte, Dec. 19, 1877, in the Court of Session.

[2] Molina, *De Hispanorum Primogenitorum Origine et Natura*, 1672.

[3] The French constitution of Bayonne (1808) abolished majorats producing less than 5000 or more than 20,000 piastres.

[4] There is also the *Arre foeste*, or entailed lease to the tenant and his heirs for ever, escheating to the owner on failure of heirs, and without powers of sale or mortgage.

On the whole subject see *Reports by H. M. Consuls on Systems of Land Tenure*, 1870. (W. C. S.)

ENTOMOLOGY. See Insects.

ENTOZOA, from ἐντός, within, and ζῷον, an animal, a name applied to internal parasites. See Parasites.

ENTRECASTEAUX, Joseph-Antoine Bruni d' (1739–1793), a celebrated French navigator, was born at Aix in 1739. He entered the navy at the age of fifteen. At the commencement of the war in 1778 he commanded a frigate of 32 guns, and by his clever seamanship was successful in convoying a fleet of merchant vessels from Marseilles to the Levant, although they were attacked by two pirate vessels, each of which was larger than his own ship. In 1785 he was appointed to the command of the French fleet in the East Indies; and in 1787 he was named governor of the Mauritius and the Isle of Bourbon. While in command of the East India fleet, he made a voyage to China, an achievement which led the French Government to select him to command an expedition in search of La Pérouse, of whom nothing had been heard since February, 1788. Entrecasteaux failed to obtain any tidings of him, but in the course of his search he made important geographical discoveries. He traced the outlines of the eastern coast of New Caledonia, discovered many fine harbors and roadsteads on the south of Tasmania, and touched at more than 300 places on the southwest coast of New Holland. While near the island of Java he was attacked by scurvy, and died 20th July, 1793. There are three narratives of his voyages:—the first by De la Billardière, Paris, 1800, the second by De Rossel, Paris, 1808, and the third by De Frémenville, Brest, 1838.

ENZIO, king of Sardinia (1225–1272), who played a great part in the conflict between the empire and the papacy in the first half of the 13th century, was one of the natural sons of the emperor Frederick II. by his mistress the beautiful Bianca Lancia. He was born at Palermo at the close of the year 1225, the same year in which his father married as his second wife Iolante of Jerusalem. His name is conjectured to be a corruption of the German "Hans." In his thirteenth year he fought by his father's side against the Lombards at the battle of Cortenuova; and in the following year (1238) the emperor, in pursuance of his determination to recover for the empire various territories claimed as fiefs of the Holy See, married Enzio to Adelasia, the widowed heiress of Sardinia and Corsica, and at the same time conferred on him the title of king of Sardinia. He also received the honor of knighthood from his father. In May, 1239, he was declared vicar imperial in the north of Italy, and took command of the German and Saracen troops in the imperial army. From this time Enzio was his father's right hand in war. He at once entered the March of Ancona; and so formidable to the papacy were his achievements that the most distinguished soldier-cardinal, John of Colonna, was sent against him. Before the end of the year the pope, Gregory IX., excommunicated Frederick and his son; and a crusade against them was soon after preached. This beating of the "drum ecclesiastic," however, did not scare them from their purpose. In 1241 Enzio was entrusted with the command of the fleet, and in this post he added to his already high reputation by a victory over the Genoese. The pope having convoked a council at Rome, the prelates were flocking to it in large numbers in defiance of the emperor's remonstrances and commands. They were conveyed on board a number of Genoese galleys; and this fleet Enzio, in conjunction with the Pisans, encountered and defeated near Meloria (May 3). Three vessels were sunk and nineteen captured. Amongst the captives were three cardinal-legates, and many bishops and archbishops. The booty taken was immense, and included the vast sums of money which the notorious Cardinal Otho had just collected in England. The prelates were all taken to Naples, and were kept in close confinement, bound with silver chains in mockery. After the death of the pope (August) Enzio was sent with a large army to aid his brother Conrad, king of the Romans, against the invading Tatar hosts. By the victory won by the two brothers of the house of Hohenstauffen, near the Delphos, an affluent of the Danube, Europe and Christendom were finally delivered from the presence of these desolating hordes. Enzio was afterwards sent into Lombardy, which was for several years the scene of his chief exploits. In 1245 he was excommunicated with the emperor by Pope Innocent IV. Two years later he besieged Parma, but was compelled to retire. He soon after besieged Colonna. In 1249 he took the castle of Arola, and on this occasion he sullied his fair fame by putting to death more than a hundred Guelfs of Reggio who were taken prisoners there. At the head of the Modenese, Enzio encountered the troops of Bologna, May 26, 1249, at Fossalta, and was wounded and taken prisoner. He was consigned to perpetual imprisonment, and nothing could move his captors to abate a jot of their rigor. On one occasion he nearly succeeded in making his escape concealed in a cask, but was recognized by his golden hair. "A captive at the age of twenty-four," says Dean Milman, "this youth, of beauty equal to his bravery,—the poet, the musician, as well as the most valiant soldier and consummate captain,—pined out twenty-three years of life, if not in a squalid dungeon, in miserable inactivity." Enzio was passionately loved by Lucia Biadagioli, a high-born maiden of Bologna, who was given to him as a companion; and she made several unsuccessful attempts to restore him to freedom. He was the best-beloved son of the emperor, who would have given any sum for his ransom, and to whom the loss of him was a life-long affliction. Nor was he less idolized by his followers for his brave, honorable, and generous character as a leader in war. Enzio died in confinement at Bologna, March 14, 1272. The Bolognese gave him a magnificent funeral. His body was embalmed, robed in scarlet, and lay in state for some days wearing a golden crown and sceptre. It was then buried in the church of St. Dominic, and a marble tomb was erected in memory of the hero. History, says Mr. Kingston (*Hist. of Frederick the Second*, vol. ii. p. 289), does not record a more sorrowful tale.

EON DE BEAUMONT, Charles Geneviève Louise Auguste André Timothée d' (1728–1810), commonly known as the Chevalier d'Eon, a political adventurer, was born at Tonnerre, in Burgundy, on the 5th October, 1728. He was the son of an advocate of good position, and after a distinguished course of study at the Collége Mazarin, he became a doctor of law by special dispensation before the usual age, and adopted his father's profession. He commenced literary work as a contributor to Fréron's *Année Littéraire*, and attracted notice as a political writer by two works on financial and administrative questions, which he published in his twenty-fifth year. His reputation increased so rapidly that in 1755 he was, on the recommendation of the prince of Conti, entrusted by Louis XV. with a secret mission to the court of Russia. It was on this occasion that he for the first time assumed the dress of a woman, with the connivance, it is supposed, of the French court. In this disguise he obtained the appointment of reader to the empress Elizabeth, and won her over entirely to the views of his royal master, with whom he maintained a secret correspondence during the whole of his diplomatic career. After a year's absence he returned to Paris to be immediately charged with a second mission to St. Petersburg, in which he figured in his true sex, and as brother of the reader who had been at the Russian court the year before. He played an important part in the negotiations between the courts of Russia, Austria, and France during the Seven Years' War. For these diplomatic services he was rewarded with the decoration of the grand cross of St. Louis. In 1759 he served with the French army on the Rhine as aide-de-camp to the Marshal de Broglie, and was wounded during the campaign. He had held for some years previously a commission in a regiment of dragoons, and was distinguished for his skill in military exercises, particularly in fencing. In 1762, on the return of the Duc de Nivernais, Eon, who had been secretary to his embassy, was appointed his successor, first as resident agent and then as minister plenipotentiary at the court of Great Britain. He had not been long in this position when he lost the favor of his sovereign, chiefly, according to his own account, through the adverse influence of Madame de Pompadour, who was jealous of him as a secret correspondent of the king. Superseded by Count Guerchy, Eon showed his irritation by denying the genuineness of the letter of appointment, and by raising an action against Guerchy for an attempt to poison him. Guerchy, on the other hand, had previously commenced an action against Eon for libel, founded on the publication by the latter of certain state documents of which he had possession in his official capacity. Both parties succeeded in so far as a true bill was found against Guerchy for the attempt to murder, though by pleading his privilege as ambassador he escaped a trial, and Eon was found guilty of the libel. Failing to come up for judgment when called on, he was outlawed. For some years afterwards he lived in obscurity, appearing in public chiefly at fencing matches. During this period rumors as to the sex of Eon, originating probably in the story of his first residence at St. Petersburg as a female, began to excite public interest. Bets were frequently laid on the subject, and an action raised before Lord Mansfield in 1777 for the recovery of one of these bets brought the question to a judicial decision, by which Eon was declared a female. A month after the trial he returned to France, having received permission to do so as the result of negotiations in which Beaumarchais was employed as agent. The conditions were that he was to deliver up certain state documents in his possession, and to wear the dress of a female. The reason for the latter of these stipulations has never been clearly explained, but he complied with it to the close of his life. In 1784 he received permission to visit London for the purpose of bringing back his library and other property. He did not, however, return to France, though after the Revolution he sent a letter, using the name of Madame d'Eon, in which he offered to serve in the republican army. He died in London on the 22d May, 1810. During the closing years of his life he is said to have enjoyed a small pension from George III. A post-mortem examination of the body conclusively established the fact that Eon was a man.

EÖTVÖS, Jozsef, Baron (1813–1871), a distinguished Hungarian statesman, author, poet, and orator, was born at Buda on the 3d September, 1813. He was educated partly at his father's estate at Ercsi, in the megye or county of Székesfehérvár (Stuhlweissenburg), and partly in Buda, where also he studied law and philosophy from 1826–31. As early as 1830, Eötvös commenced his literary career by a translation of Goethe's *Goetz von Berlichingen*, followed shortly afterwards by two original comedies and a tragedy *Boszú* (*Revenge*), which showed a singular beauty of style. In 1833, after having passed the requisite examinations at Pozsony (Pressburg), he began at the early age of twenty his official career as a vice-notary, which position he held for two years. He then went to Vienna, where he was employed at the Hungarian chancellory; here, however, he only remained for a short time. In 1836 he commenced a long journey with the object of visiting the chief towns of Germany, Holland, France, and England, and did not return to Hungary before 1837. Shortly after this he was appointed to a seat in the district court of justice at Eperies, which office he soon resigned, withdrawing to his grandfather's estate at Sályi, where for some time he devoted himself to literary studies. His dramatic works had meanwhile attracted the attention of the Kisfaludy society, of which learned body he was elected a member in the year 1835. But he reached the zenith of his fame as an author in the year 1838, when his novel *Karthausi* (*The Carthusian*) appeared in the celebrated *Árvizkönyv* (*Inundation-Book*), of which he was himself the editor, and which was published between 1838 and 1841 at Pesth, for the benefit of the sufferers from the floods which devastated that city in 1838. The articles comprised in this work, which extended to five volumes, were contributed by various distinguished literary men, amongst whom Eötvös, as having written the longest and most important article, occupies a conspicuous place. In recognition of his literary merit he was in 1839 elected a member of the Hungarian Academy of Sciences. In the year 1840 Eötvös, having removed from Sályi to Buda, took his seat in the Upper House of the Hungarian Diet, and identified himself with the advanced political movement of that period, aiding his eloquence by his writings. Among the many important works which emanated from his pen at this time, one entitled *A Falu Jegyzöje* (*The Village Notary*), which appeared in 1845, demands especial attention. In this work the author vividly depicts the abuses of the old system of public administration in Hungary by county elections; and the vigor of the narrative, combined with the humorous and political character of the incidents related, has caused it to be considered as one of the best national tales in the whole circle of European literature. An English translation of this romance, by Otto Wenckstern, with an introduction by F. Pulszky, to whom the original was dedicated, appeared in 1850; and there is also an excellent German translation by Count J. Mailáth. The *Notary* was followed in 1847 by an historical romance of the 16th century, *Magyarország 1514 ben*, translated afterwards into German under the name of *Bauernkrieg;* this work struck the keynote of that emancipation of the peasantry which was virtually effected in 1848. In fact, the reforms which from time to time were introduced into the Hungarian constitution must be in a great measure ascribed to the political and literary labors of Eötvös. His work *Reform* was a collection of articles which he had previously contributed to one of the leading Hungarian newspapers, the *Pesti Hirlap*.

Upon the formation of the first responsible Hungarian ministry on the 15th March, 1848, Baron Eötvös received the portfolio of minister of public instruction; but on the 28th September he was obliged to relinquish that post, in consequence of the assassination of Lamberg, the Austrian governor of Hungary. He then proceeded to Vienna, and subsequently to Munich, returning to Pesth in 1851. Soon after his return he published an important political treatise, both in Hungarian and German, entitled *A XIX. század uralkodó eszméinek befolyása az álladalomra* (*The influence of the Ruling Ideas of the 19th Century on the State*). By this work, and others of a similar tendency, he was instrumental in preparing the popular mind for those constitutional changes which were afterwards so beneficially introduced; and when, in 1867, the second Hungarian ministry was called into existence, Eötvös was again entrusted with the portfolio of minister of public instruction. Already in the year 1855 he had been elected vice-president of the Hungarian Academy of Sciences, and in 1866 he attained the high honor of president. He died on the 2d February, 1871, after a few weeks' illness, in the fifty-eighth year of his age.

EPAMINONDAS, the most celebrated general of Thebes, born towards the close of the 5th century B.C., was the son of Polymnis, and belonged to a noble family. Brought up in poverty, he was diligent in acquiring the culture of the age, and became skilful in gymnastic exercises and in playing the flute. For his intellectual education he was chiefly indebted to Lysis of Tarentum, a Pythagorean exile. According to the account given by Plutarch, he served on the Spartan side at the battle of Mantinea in 385 B.C. along with Pelopidas, who having fallen apparently mortally wounded during the engagement, was protected by Epaminondas at the risk of his life. Some have supposed this incident to have been the origin of a friendship which is one of the most honorable and enduring in ancient Greek history. Epaminondas was almost past his prime before he took any prominent part in public affairs. He refused at first to co-operate in the revolution of 379 B.C., of which his friend Pelopidas was one of the leaders, owing to Pythagorean scruples as to the possible shedding of innocent blood. But his desire to be freed from the Spartan yoke was as keen as that of any of his fellow-citizens, and after the blow was struck he did his utmost to stir up the Theban youth to maintain their independence. In 371 B.C. Epaminondas was one of the chief representatives of Thebes at the conference at Sparta where the Athenians sought to arrange a peace. He claimed the right to sign the treaty for Bœotia, thus asserting the supremacy of Thebes over the Bœotian cities. The claim was not recognized by the representatives of the other states, and as Epaminondas insisted on it, Thebes was excluded from the treaty altogether. A Spartan invasion of Bœotia under Cleombrotus immediately followed the rupture of negotiations. With an army not one-half the strength of that opposed to it, Epaminondas inflicted a crushing defeat upon the invaders in the celebrated battle of Leuctra (371). He immediately set himself to consolidate the position of Thebes by forming alliances and by weakening Sparta. With the latter object in view, he supported the founding of Megalopolis and the organization of Arcadia as an independent government. In 369 he entered the Peloponnesus, and took another important step towards the weakening of Sparta by establishing the Messenians in their own country, and founding the city of Messene on Mount Ithome. On their return home Epaminondas and Pelopidas were accused of having retained their command beyond the legal period. Though there was no doubt that they had broken the letter of the law, Epaminondas made a spirited defence, which secured the acquittal of both. In the spring of 368 Epaminondas was again in the Peloponnesus, and detached Sicyon and Pellene from the Lacedæmonian alliance. On his return, however, he was repulsed by Chabrias in an attack which he made upon Corinth. Later in the same year he took part in the unsuccessful expedition sent to Thessaly to deliver Pelopidas from Alexander of Pheræ, though he did not hold a command, having been degraded owing to an impression that he had not been sufficiently active against Sparta in the previous campaign. In the next year (367) he was sent at the head of an army into Thessaly, and succeeded in freeing Pelopidas without requiring to give battle. Meanwhile the relation of the Arcadians with Thebes had been growing unfriendly, and all the efforts of Epaminondas could not prevent them from forming an alliance with Athens. Matters were brought to a crisis in 363, when the Theban governor of Tegea arrested the representatives of Arcadia, who had met there to conclude a peace with Elis. Though the prisoners were released in a short time, and an apology made for their arrest, the Arcadians demanded the punishment of the governor. Epaminondas replied that the mistake lay not in the arrest but in the release, and that he would come shortly and reduce the Arcadians to reason. Accordingly in 362 he invaded the Peloponnesus for the fourth time. A pitched battle was fought at Mantinea, in which the Thebans were victorious, but Epaminondas was mortally wounded. He was carried out of the throng, and being told that he would die as soon as the javelin was withdrawn from his wound, he did not allow this to be done until he had heard that his army was victorious and that his shield was safe. A column was erected over his grave, which was made on the spot where he fell.

ÉPÉE, Charles-Michel, Abbé de l' (1712–1789), celebrated for his labors in behalf of the deaf and dumb, was born at Paris 25th November, 1712, being the son of the king's architect. He studied for the church, but having declined to sign a religious formula opposed to the doctrines of the Jansenists, he was denied ordination by the bishop of his diocese. He then devoted himself to the study of law; but about the time of his admission to the bar of Paris, the bishop of Troyes granted him ordination, and offered him a canonry in his cathedral. This bishop died soon after, and the abbé, coming to Paris, was, on account of his relations with Soanen, the famous Jansenist, deprived of his ecclesiastical functions by the archbishop of Beaumont. About the same time it happened that he heard of two deaf mutes whom a priest lately dead had been endeavoring to instruct, and he offered to take his place. The Spaniard Pereira was then in Paris, exhibiting the results he had obtained in the education of deaf mutes; and it has been affirmed that it was from him that Épée obtained his manual alphabet. The abbé, however, affirmed that he knew nothing of Pereira's method; and whether he did or not, there can be no doubt that he attained far greater success than Pereira or any of his predecessors, and that the whole system now followed in the instruction of deaf mutes virtually owes its origin to his intelligence and devotion. In 1755 he founded, for this beneficent purpose, a school which he supported at his own expense until his death, and which afterwards was succeeded by the "Institution Nationale des Sourds Muets à Paris," founded by the National Assembly in 1791. He died 23d December, 1789. In 1838 a bronze monument was erected over his grave in the church of Saint Roch. He published various books on his method of instruction, but that published in 1784 virtually supersedes all others. It is entitled *La véritable manière d'instruire les sourds et muets, confirmée par une longue expérience.* He also began a *Dictionnaire général des Signes*, which was completed by his successor, the Abbé Sicard.

EPERIES, or Presova, in Hungarian Eperjes, a royal free town of Hungary, capital of the vármegye or county of Sáros, and situated on the left bank of the River Tarcza, an affluent of the Theiss (48° 55′ N. lat., 21° 15′ E. long.), 143 miles north-east of Pesth. Next to Kaschau, Eperies is the finest town in Upper Hungary, and has considerable manufactures of cloth, wool, table-linen, and earthenware. The principal trade is in wine, linen, cattle, and grain. In the neighborhood are the royal salt-works and mines of Sóvár and the chalybeate springs of Szemete. The town itself is deficient in its supply of pure spring water. Since the year 1807 Eperies has been the seat of a Greek Catholic bishopric; and it possesses an episcopal library, a Catholic gymnasium, a normal high school, and an evangelical district college. Among the principal buildings are one Lutheran and four Roman Catholic churches, a Jews' synagogue, a town-hall, and a county court-house. The population in the year 1857 was 8916, but in 1870 it had increased to the number of 10,772.

Eperies was founded about the middle of the 12th century by a German colony, and was elevated to the rank of a royal free town in 1347 by Louis I. (the Great). It was afterwards fortified, and received special privileges. On August 11, 1685, it was taken from the Turks by the Austrians under General Schulz. In 1687 General Caraffa erected a scaffold in the public square, upon which he decapitated, in a single day, thirty notables of the town. Eperies became in 1768 the head-quarters of the confederation of Bar.

EPERNAY (the ancient *Aquæ Perennes*) the chief town of a French arrondissement in the department of the Marne, is situated on the left bank of the Marne, at the extremity of a beautiful and fertile valley on the line of railway between Paris and Strasburg, 20 miles W.N.W. of Chalons, and 75 miles east of Paris. The town is neatly built, and in its suburbs are many handsome villas, inhabited chiefly by rich wine merchants. It is best known as the principal *entrepôt* of the champagne wines, which are kept here bottled in extensive vaults in the chalk rock on which the town is built. Among its other industries may be named the spinning and weaving of wool, printing, stocking-making, tanning, brandy-making, and the manufacture of chemicals. The principal buildings are the town-house, in which is a public library with 15,000 volumes, the palace of justice, the theatre, and the parish church, built in the Italian style, and containing some fine stained-glass windows. The population in 1872 was 12,877.

Epernay was burned by Francis I. in 1545, to prevent Charles V. obtaining possession of its wine stores. It resisted Henry of Navarre in 1592, and Marshal Biron fell in the attack which preceded its capture. In 1642 it was, along with Château-Thierry, erected into a duchy, and assigned to the duke of Bouillon.

EPHEMERIDÆ, a remarkable family of Pseudo-Neuropterous Insects, deriving the name from ἐφήμερος, in allusion to the very short lives of the winged insects. In some species it is possible that they have scarcely more than one day's existence, but others are far longer lived, though the extreme limit is probably rarely more than a week. The family has very sharply defined characters, which separate its members at once from all other neuropterous (or pseudo-neuropterous) groups.

These insects are universally aquatic in their preparatory states. The eggs are dropped into the water by the female in large masses, resembling, in some species, bunches of grapes in miniature. Probably several months elapse before the young larvæ are excluded. The sub-aquatic condition lasts a considerable time: in *Cloëon*, a genus of small and delicate species, Lubbock proved it to extend over more than six months; but in larger and more robust genera (*e. g.*, *Palingenia*) there appears reason to believe that the greater part of three years is occupied in preparatory conditions. The larva is elongate. The head is rather large, and is furnished at first with five simple eyes of nearly equal size; but as it increases in size the homologues of the faceted eyes of the imago become larger, whereas those equivalent to the ocelli remain small. The antennæ are long and thread-like, composed at first of few joints, but the number of these latter apparently increase at each moult. The mouth parts are well developed, consisting of an upper lip, powerful mandibles, ordinarily three-jointed maxillary palpi, a deeply quadrifid labium or lower lip, and three-jointed labial palpi. There are three distinct and large thoracic segments, whereof the prothorax is narrower than the others; the legs are much shorter and stouter than in the winged insect, with monomerous tarsi terminated by a single claw. The abdomen consists of ten segments, the tenth furnished with long and slender multi-articulate tails, which appear to be only two in number at first, but an intermediate one gradually develops itself (though this latter is often lost in the winged insect). Respiration is effected by means of external gills placed along both sides of the dorsum of the abdomen and hinder segments of the thorax. These vary in form: in some species they are entire plates, in others they are cut up into numerous divisions, in all cases traversed by numerous tracheal ramifications. According to the reseaches of Lubbock and of the Messrs. Joly, the very young larvæ have no breathing organs, and respiration is effected through the skin. Lubbock traced at least twenty moults in *Cloëon;* at about the tenth rudiments of the wing-cases began to appear. These gradually become larger, and when so the creature may be said to have entered its "nymph" stage; but there is no condition analogous to the pupa-stage of insects with complete metamorphoses. There may be said to be three or four different modes of life in these larvæ: some are fossorial, and form tubes in the mud or clay in which they live; others are found on or beneath stones; while others again swim and crawl freely among water plants. It is probable that some are carnivorous, either attacking other larvæ or subsisting on more minute forms of animal life; but others perhaps feed more exclusively on vegetable matters of a low type, such as diatoms.

When the aquatic insect has reached its full growth, it emerges from the water or seeks its surface; the thorax splits down the back, and the winged form appears. But this is not yet perfect, although it has all the form of a perfect insect and is capable of flight; it is what is variously termed a "pseud-imago," "sub-imago," or "pro-imago." Contrary to the habits of all other insects, there yet remains a pellicle that has to be shed, covering every part of the body. This final moult is effected soon after the insect's appearance in the winged form; the creature seeks a temporary resting-place, the pellicle splits down the back, and the now perfect insect comes forth, often differing very greatly in colors and markings from the condition in which it was only a few moments before. If the observer take up a suitable position near water, his coat is often seen to be covered with the cast sub-imaginal skins of these insects, which had chosen him as a convenient object upon which to undergo their final change. In some few genera of very low type it appears probable that, at any rate in the female, this final change is never effected, and that the creature dies a sub-imago.

The winged insect differs considerably in form from its sub-aquatic condition. The head is smaller, often occupied almost entirely above in the male by the very large eyes, which in some species are curiously double in that sex, one portion being pillared, and forming what is termed a "turban;" the mouth parts are aborted, for the creature is now incapable of taking nutriment either solid or fluid; the antennæ are mere short bristles, consisting of two rather large basal joints and a multi-articulate thread. The prothorax is much narrowed, whereas the other segments (especially the mesothorax) are greatly enlarged; the legs long and slender, the anterior pair often very much longer in the male than in the female; the tarsi four- or five-jointed; but in some genera (*e.g.*, *Oligoneuria* and allies) the legs are aborted, and the creatures are driven helplessly about by the wind. The wings are carried erect: the anterior pair large, with numerous longitudinal nervures, and usually abundant transverse reticulation; the posterior pair very much smaller, often lanceolate, and frequently wanting absolutely. The abdomen consists of ten segments; at the end are either two or three long multi-articulate tails; in the male the ninth joint bears forcipated appendages; in the female the oviducts terminate at the junction of the seventh and eighth ventral segments. The sexual act takes place in the air, and is of very short duration, but is apparently repeated several times, at any rate in some cases.

Ephemeridæ are found all over the world, even up to high northern latitudes. Pictet, Eaton, and others have given us valuable works or monographs on the family, but the subject still remains little understood, partly owing to the great difficulty of preserving such delicate insects; and it appears probable they can only be satisfactorily investigated as moist preparations. The number of described species is less than 200, spread over many genera.

From the earliest times attention has been drawn to the enormous abundance of species of the family in certain localities. Scopoli, writing more than a century ago, speaks of them as so abundant in one place in Carniola that in June twenty cart-loads were carried away for manure! *Polymitarcys virgo*, which, though not found in England, occurs in many parts of Europe (and is common at Paris), emerges from the water soon after sunset, and continues for several hours in such myriads as to resemble snow showers, putting out lights, and causing inconvenience to man and annoyance to horses by entering their nostrils. In other parts of the world they have been recorded in multitudes that obscured passers-by on the other side of the street. And similar records might be multiplied almost to any extent. In Britain, although they are often very abundant, we have scarcely anything analogous.

Fish, as is well known, devour them greedily, and enjoy a veritable feast during the short period in which any particular species appears. By anglers our common species of *Ephemera* (*vulgata* and *dania*, but more especially the latter, which is more abundant) are known as the "May-fly," but the terms "Green Drake" and "Bastard Drake" are applied to conditions of the same species. Useful information on this point will be found in Ronalds's *Fly-Fisher's Entomology*, edited by Westwood.

A singular creature, with a carapace almost like that of a miniature tortoise, originally described by Latreille as a doubtful genius of Branchiopod Crustacea under the name of *Prosopistoma*, of which two species are known (one occurring in France, the other in Madagascar), is now almost proved by Messrs E. and N. Joly to be the aquatic condition of some insect of this family.

Ephemeridæ belong to a very ancient type of insects, and their fossil imprints are common, occurring even in the Carboniferous formation. (R. M‘L.)

EPHESIANS, THE EPISTLE TO THE. *Destination of the Epistle.*—The first and most important inquiry connected with the epistle to the Ephesians has reference to the persons to whom it was originally addressed; and this inquiry again depends so much upon the reading of the first verse of the epistle that, before proceeding further, it is necessary to determine as far as possible what that reading is. In the Authorized Version the epistle opens with the words, "Paul, an apostle of Jesus Christ by the will of God, to the saints which are at Ephesus, and to the faithful in Christ Jesus." "At Ephesus" is the expression in dispute. The two words are omitted by the first hand of the Vatican and Sinaitic MSS., and by the second hand of 67, a cursive MS. of the 12th century, whose corrected text Griesbach considered much more valuable than the text as it originally stood; but they are found in all other MSS. and versions.

External evidence as to destination.

Strong as is the evidence arising from the combination of the Vatican and the Sinaitic MSS., it would be difficult to resist the singular amount of authority opposed to them, were it not for passages from writers and fathers earlier than the earliest of our existing MSS., which show that the absence of the words was not only known to them, but was so far accepted, as at least probably correct, that they made it a ground of curious speculation with regard to the particular method of designating Christians then employed by the apostle. The earliest witness is Marcion, about the middle of the 2d century, although he deals only with the fact. We gather Marcion's view from the language of Tertullian. In his treatise *Contra Marcionem* (v. 11, 17), the African father charges Marcion with having, contrary to the *veritas ecclesiæ*, given a false title to the epistle, designating it as the epistle to the Laodiceans, *quasi et in isto diligentissimus explorator.*[1] Had Marcion read "at

Marcion.

---

[1] The passages from Tertullian, as well as from the other fathers to be subsequently quoted, will be found at length in most of the introductions to the New Testament in common use. We take them from the *Conspectus* of authorities in Tischendorf's New Test., ed. viii.

Ephesus" in the first verse of the epistle, it would have been impossible for him to falsify the title, changing it into "the epistle to the Laodiceans." The change would have been at once refuted by the opening words. It will be observed that Tertullian does not accuse him of altering the text. Marcion therefore must have read without "at Ephesus," and must have urged that he was led to this conclusion by his diligent inquiries. It is difficult to see why, in assigning such a reason for his view, he is not to be believed. He could have no *dogmatic* interest in adopting the one reading rather than the other. The inferences are (1) that Marcion did not read "at Ephesus;" (2) that even in his time the epistle was generally regarded as addressed to the Ephesians; (3) that he, as the result of careful investigation, believed it to have been addressed to the Laodiceans.

Tertullian.

It is more difficult to draw any conclusion from Tertullian's words as to the reading adopted by himself. There is no doubt force in the argument of Harless and others that, when determining any disputed point with regard to the New Testament, his principles led him to appeal to the authority of tradition and not to critical considerations. But this was in cases where there was a doubt. Here, with "at Ephesus" in the text, there could be none; and it is hardly possible to imagine that, if he had these words before him, he should not, even while resting upon the *veritas ecclesiæ* as sufficient for his purpose, have taken occasion from them to pour out upon the heretic all the vials of his indignant scorn. Instead of that he only speaks, however scornfully, of Marcion's great diligence in inquiry, and refers to nothing but the "title." The inferences are (1) that in all probability Tertullian did not read "at Ephesus," and (2) that he knew of but one tradition in the church reaching back to the earliest times, and unhesitatingly accepted by him, that the epistle had been addressed to the Ephesians.

Origen.

The evidence of Origen is important. In a *catena* containing part of his lost commentary upon the epistle, that eminent father is quoted as saying that "in the Ephesians alone" has he found the words "to the saints that are;" as inquiring into the meaning of the strange expression; as explaining it by the supposition that of those who are made partakers of the "I am" it may fitly be said "They are;" and as confirming his interpretation by the words of the same Paul, who speaks in a similar manner elsewhere, when he writes that "God has chosen the things that are not to bring to naught the things that are." The inferences are (1) that Origen did not read "at Ephesus," or he would not have commented as he does, and (2) that he knew the epistle as one to the Ephesians.

Basil.

Once more, Basil, about the end of the 4th century, reasons in an exactly similar way, quoting without the expression in dispute, and adding that he had obtained the reading "from those who had gone before him, and from his own study of ancient MSS." The inferences in his case are the same as in the case of the others already mentioned, with this difference, that the reading "at Ephesus" was now generally accepted in the church.

It is unnecessary to refer to Jerome, while the evidence of the Ignatian epistle, if it may be relied on, simply shows that very early in the 2d century a whole epistle, which can hardly be any other than our present one (the longer recension leaves no doubt upon the point), was believed to have been written by St. Paul to the Ephesian church. Some slight force may be added to the testimony of Marcion and Basil by the consideration that both belonged to Asia Minor, and that their sphere of labor was contiguous to the district to one part or another of which the epistle was sent by the apostle.

In the light of these considerations, the MS. authority in favor of the omission of "at Ephesus" assumes a very different importance from what it might otherwise possess. It is clear that in the first half of the 2d century there were MSS. in circulation which did not read the words; and that, during the 4th century, MSS. then considered "ancient," which also omitted them, were at least regarded as highly authoritative by distinguished men.

Internal evidence as to destination.

The internal evidence is even more decisive than the external. Without the words the reading in question is one of the most difficult of the New Testament. It is almost impossible to give a satisfactory explanation of it. It is at variance with the style of language always used by the apostle on similar occasions. It cannot be explained by the supposition that the dogmatic rendering of which we have spoken was first given to the "are," and that then, for the sake of this, "at Ephesus" was dropped. With "at Ephesus" in the text, such a dogmatic rendering could hardly have suggested itself, and the name of a place was rather inserted to get rid of it. Finally, except on the supposition that the epistle was addressed directly to Ephesus, a supposition that few will accept, the history of the insertion connects itself with that particular form of the "circular letter" theory which is of all others the most improbable, and most out of keeping with the character of the apostolic age. On the other hand, the insertion of the words was extremely natural. They took the place of nothing where something seemed obviously required. There was no other city whose name would so readily suggest itself for insertion as that of Ephesus. It was the metropolis of the province. St. Paul had spent there a longer time than in any other city visited by him on his missionary tours. It was to be expected that he should write to it. The letter was no doubt read in Ephesus; and, leaving that city without any designation of its readers, it would, as it spread thence to all parts of the Christian world, be supposed to have been addressed to the church which was the great centre of its circulation. These considerations, too, would no doubt derive additional weight from the notice in 2 Tim. iv. 12, "Tychicus have I sent to Ephesus," compared with Eph. vi. 21. Everything, in short, was in favor of the insertion,—everything against the omission.[1] On all sides the strength of the argument is irresistible; and we conclude that the words "at Ephesus" form no part of the genuine text of our epistle.

Theories of destination.

With the removal of the words "at Ephesus" from the opening of the epistle, the way is cleared for the consideration of the question of its destination. Three main theories require to be shortly noticed. (1.) The first is that the recognized designation is correct. The absence of the words we have found it necessary to eliminate does not of itself prove that the epistle was not sent to Ephesus. It forms a presumption against such a supposition, for St. Paul's practice is to name the churches to which he writes. But it does not do more. As we have already seen, even those fathers who did not read "Ephesus" in i. 1 accepted the title "to the Ephesians." Such had been the tradition of the church, and Marcion alone had questioned its correctness. Great difficulties, however, oppose the reception of this theory. Little stress can indeed be laid on the want at the end of the epistle of the greetings so commonly sent by St. Paul to different members of the churches known to him. Such greetings are wanting also in the epistles to Thessalonica, although the apostle wrote to that city under circumstances peculiarly calling forth his affectionate remembrance of his converts there. It is otherwise with the indications contained in the epistle itself that its writer was personally unknown to those to whom he writes, and that they, on their part, knew of him and of his work rather by the information of others than by actual experience:—"If so be that ye heard of the dispensation of the grace of God which was given me to youward" (iii. 2), where the particles εἰ γε cannot be understood as stating only the ground, without the introduction of doubt, upon which the argument was proceeding (Alford), a use of εἰ γε not allowed by grammarians (Moulton's Winer, p. 561), and where the certainty wanting in the particle is not given by the context (as Meyer); "For this cause I also, having heard of the faith in the Lord Jesus which is in yourselves, . . . cease not to give thanks for you" (i. 15, 16), where the parallel passage in Colossians (i. 9 compared with i. 6), contrasting the day when the apostle first "heard" of their knowledge of the grace of God in truth with that when they first "heard" of that grace, points out to us in a way not to be mistaken the sense in which the verb is to be understood (Lightfoot, *On the Col.*, p. 28). But St. Paul could not have used such language in reference to the Ephesians. He had labored too long among them, had been too successful in his ministry, and had acquired too intimate a personal knowledge of their condition, to have permitted him to speak thus either of himself or them. Add to this the fact that in Eph. i. 1 the apostle does not associate Timothy with himself, although that disciple was well known to the church at Ephesus, while he does mention him in the salutations of the epistles to the Colossians and to Philemon written at the same time, and the evidence is very strong that the epistle before us was not, in the first instance at least, addressed to the Ephesian church.[1] (2.) Another theory, generally associated with the name of Archbishop Ussher, although hardly less connected with that of Beza, has in later years found such general acceptance that it may probably be regarded as at this moment the prevailing view,—that the epistle is a circular letter, designed, not for Ephesus alone, but for many churches of Asia or the Peloponnesus or still wider districts. The modifications of this theory have been extremely numerous, varying with the adoption or rejection of the reading "at Ephesus" in i. 1, as well as with the difficulties felt by those adopting it as to the manner in which the epistle was to be circulated. It is unnecessary to examine these theories separately. They are, as a group, exposed to objections which appear to be insuperable. 1. There is not the slightest trace of the existence of such a theory in Christian antiquity. 2. Had the apostle intended the epistle to be a circular one, nothing would have been easier for him than to say so. He does employ such a general designation in Gal. i. 2 and 2 Cor. i. 1. The expression "the churches of Asia" was familiar to him (1 Cor. xvi. 19, comp. Rev. i. 4). 3. No other name than Ephesus, except Laodicea, appears to have been at any time connected with the epistle. Even this name, too, seems not to have been placed in the text. The statement of Marcion, our only authority for thus associating Laodicea and the epistle with one another refers not to the text, but to the title. 4. The epistle has distinct reference to particular persons (i. 15, 16, vi. 22). 5. The idea of a number of copies furnished to Tychicus with a space in blank for the name to be filled in is entirely at variance with the simplicity of the apostle and the character of the apostolic age. The circular hypothesis, in any of the forms thus proposed, may be abandoned with little hesitation. (3.) There remains a third theory which cannot be omitted. It adopts the circular idea, but at the same time identifies the epistle to the Ephesians with the epistle spoken of at Col. iv. 16 as "that from Laodicea." This theory has been adopted by Canon Lighfoot in the following words:

---

[1] It is probable that the form of the evidence now given is resisted mainly because of the impression that the insertion of "at Ephesus" makes easy a reading otherwise almost inexplicable. But this is not the fact. The rendering is *as difficult with the words "at Ephesus" in the text as without them.* The combination of the verb with the place named is then, indeed, easy enough, and it finds a parallel in Rom. i. 7. But the difficulty lies elsewhere. It lies in the combination of the simple καὶ πιστοῖς immediately following with this participial clause; and that difficulty is in no degree touched by taking "at Ephesus" into the text. In fact, the difficulty is thus rather increased, the only translation that can then be given, "To the saints which are in Ephesus, and the faithful in Christ Jesus," being apparently inadmissible. Could one only persuade himself to render καὶ by "also" when "at Ephesus" is dropped, all would be simple. "To the saints who are also faithful in Christ Jesus;" but surely St. Paul could not have spoken thus.

> "The apostle wrote at this time a circular letter to the Asiatic churches, which got its ultimate designation from the metropolitan city, and is consequently known to us as the epistle to the Ephesians. It was the immediate object of Tychicus's journey to deliver copies of this letter at all the principal centres of Christianity in the district, and at the same time to communicate by word of mouth the apostle's special messages to each (Eph. vi. 21, 22). Among these centres was Laodicea. Thus his mission brought him into the immediate neighborhood of Colossæ. But he was not charged to deliver another copy of the circular letter at Colossæ itself, for this church would be regarded only as a dependency of Laodicea; and, besides, he was the bearer of a special letter from the apostle to them. It was sufficient, therefore, to provide that the Laodicean copy should be circulated and read at Colossæ."

Dr. Lightfoot further expresses his belief that "educated opinion is tending, though slowly, in this direction," and that "ultimately this view will be generally received" (*Colossians*, p. 347). In the absence of Dr. Lightfoot's as yet unpublished arguments in favor of the view thus taken by him, it is impossible to say whether he may be successful in establishing it or not. But, in the mean time, it seems liable, with the exception of that part which identifies the epistle to the Ephesians with the epistle "from Laodicea" of Col. iv. 16, to all the objections which we have urged against the circular hypothesis, together with the additional difficulty of supposing that Tychicus, starting with a number of copies of the letter in his hands, should either leave his last copy at Laodicea, or that, if any remained, the Colossian church, instead of getting one of them, should be instructed to procure its copy from Laodicea. If, on the other hand, it be said that the words "the epistle from Laodicea" are not a mere note of the place whence the epistle might be procured, but that, in one way or another, they point to a special connection between the epistle and the city, it will follow that the former had a particular designation and was not circular.

The theories examined by us are all unsatisfactory. We have to ask whether there is any other way of meeting the difficulties of the case.

The epistle designed for Gentile Christians.

1. The first thing here arresting attention is, that wholly Gentile readers are presupposed in the epistle (ii. 11, 12; iii. 1; iv. 17). Nor this alone. When St. Paul speaks of his apostleship, he speaks of himself with much greater emphasis than usual as the apostle of the Gentiles (iii. 1–8). And, still further, in two highly important passages, the force of which is lost in the Authorized Version, he shows that he has the Gentiles in view, not in what they become when they are brought to form part of the one holy temple, of the one redeemed family, of God, but in what they are when regarded as distinct and separate from the Jews:—"In whom *every* building fitly framed together groweth into a temple holy in the Lord" (ii. 21);[2] "For this cause I bow my knees unto the Father from whom *every* family in heaven and on earth is named" (iii. 14, 15). It has been customary to say that in the church addressed the Gentile element prevailed, and that hence the wants of the Gentiles are mainly before the writer. But, in fact, there is no trace of Jewish readers in the epistle, "not even in ii. 15," and Dr. Davidson, observing this, not unnaturally grounds upon it the argument that, addressed to the church at Ephesus, it must be later than St. Paul's time, because the apostle could not have left the Jewish Christians unnoticed (*Intr.*, i. p. 379).

May not the true conclusion be one of an altogether different character?—that our epistle to the Ephesians was not addressed to a *church* at all. There was probably no church at that time in Asia composed of Gentile converts alone. All of them were mixed communities. The tone of the epistle to the Colossians shows us that the errors prevailing in Colossæ were of a Judæo-Gnostic character, and that the most powerful element in that church was Jewish. It is not an unfair inference that this must also have been the case in the neighboring churches of Laodicea, Hierapolis, and Ephesus. How then could St. Paul, writing to any one of these churches, speak to it as if it were wholly Gentile, as if the Jewish element had no existence in it? The true explanation seems to be, that we have in the Ephesian epistle not an epistle to a *church;* that we have an appeal to Gentile Christians as such; that the apostle is thinking of his readers in that capacity, and not as a merely constituent part of any local church whatever.

The same as that from Laodicea.

2. A second point claiming consideration is, that we have no small reason to suppose that "the epistle from Laodicea" of Col. iv. 16 is that before us. The authority of distinguished critics can be quoted for this view (Grotius, Wetstein, Hammond, Mill, Canon, Lightfoot, etc.); and it is not to be regarded as mere conjecture. We have seen that Marcion, as the result of diligent inquiry, had come to the conclusion that the epistle to the Ephesians ought to have borne the name of the epistle to the Laodiceans. We know also that a passage quoted by him from the latter is found in the former (see in Tischendorf's New Test. Eph. i. 1), thus identifying the two epistles by their contents as well as by their titles. We must give some weight to the improbability that an epistle to which St. Paul attached such im-

---

[1] Another consideration worthy of notice is suggested to the writer by a friend. In Eph. v. 1 the apostle calls upon his readers to be *imitators of God.* It is the only occasion on which he does so. Writing to those to whom he was personally known, he always calls upon them to imitate *himself*, 1 Cor. iv. 16, xi. 1; 1 Thes. i. 6; 2 Thes. iii. 7–9. The same friend (Mr. A. Forbes, Aberdeen) suggests also, the importance of comparing the tone of the Ephesian epistle with that of St. Paul's address to the Ephesian elders in Acts xx. From that address we learn how he would have spoken, as he did speak, to members of the Ephesian church—not "if ye have heard," or "when ye read ye may understand," or "if so be that ye were taught in him;" but "ye know;" "I have not shunned to declare unto you the whole counsel of God;" "I kept back nothing, but have showed you," etc.; "remember that I ceased not to warn every one of you." The difference in tone is very marked.

[2] The word "building" here is certainly not to be understood, with Meyer, Schenkel (*in loc.*), and probably Ewald (*Geschichte* vii. p. 243, etc.), to apply to individual *Christian churches* as distinguished from the Catholic or universal church, embracing them all in one great whole. The "buildings" thought of are not simply *numerically* different from one another; they are different *in kind.* They may be heavenly or earthly, Jewish or Gentile, etc. As such they are brought into Christ, and then they become parts of one holy temple in Him. The same remark applies to the "every family" of iii. 15.

portance that he directed it to be passed on from one church to another would be lost; and, when we put all these circumstances together, there seems every reason to think that "the epistle from Laodicea" is no other than our epistle to the Ephesians.

On these grounds, then, rests the suggestion which we offer.[1] Adopting the idea that the epistle to the Ephesians is "the epistle from Laodicea" of Col. iv. 16, it seems to us that it was not intended to be an epistle to the *church* of the last-named city. It was an epistle to the Gentile converts, as such, in the first place of Laodicea, in the second place of Colossæ.

Confirmation of view taken.

The view now taken derives much confirmation from the light thrown by it upon some of the difficulties connected with the epistle which no theory yet proposed has succeeded in removing. (1.) It at once explains the want of those local references which we should naturally expect in a letter written to an organized community; while, at the same time, the persons for whom the letter is intended are a sufficiently limited class to justify the expressions of i. 15 and vi. 22. (2.) It explains the absence of any special designation in i. 1, and relieves us from the necessity of supposing that there was a blank space left in that verse. St. Paul could hardly have inserted the name of a town without leading to the false impression that he was writing to its church. (3.) It explains the fact that the name of a place should have been permitted to find its way into i. 1, where no name originally stood. Had the epistle been intended for any *church* or *churches*, they, even though not inserting their own names, would not readily have permitted the insertion of another. They would have claimed their own epistle. General Gentile readers, as not organized, could not so easily do so. (4.) It explains the remarkable expression of Col. iv. 16, "the epistle from Laodicea." We might have expected "the epistle to the Laodiceans." But what had been written was not an epistle to the Laodiceans, and therefore it is not styled one. It was an epistle to a particular section of Christians both in Laodicea and Colossæ, and only sent to Laodicea first. Hence the designation, "the epistle from Laodicea." (5.) It explains what has been found so inexplicable (Davidson, *Intr.*, i. p. 381; Harless, *Ephes. Brief*, p. 40), that writing both to the Colossians and the Laodiceans by the same messenger, the apostle should include the brethren in Laodicea in a salutation of the epistle to Colossæ, and should enjoin an epistle meant for the Colossians to be read to Laodiceans, who had one of their own by the same hand. He was not writing to the church at Laodicea; therefore let the church there have both its letter and its salutations through the neighboring church to which he was writing at the moment. (6.) It explains the absence from the epistle of all allusion to doctrinal error on the part of its recipients. We see from the Colossian epistle how deep was the hold of such errors at Colossæ. In any circumstances it would hardly be possible to imagine that similar errors did not exist both at Laodicea and Ephesus; and this conclusion as to the first of these two cities is in the present instance confirmed by the fact that the epistle to the Colossians, filled with controversy as to doctrinal errors, was directed to be read there. Again, therefore, their being left unnoticed in our so-called epistle to the Ephesians seems to be a proof that St. Paul is not writing to the church of the city addressed by him. Had he been doing so he would naturally have taken its whole condition into account; but he is dealing with one portion of its community alone, and with that portion mainly, if not only, upon one point of interest. (7.) It explains even to some extent the difficult words of i. 1, *τοῖς ἁγίοις τοῖς οὖσιν καὶ πιστοῖς ἐν Χριστῷ Ἰησοῦ.* There appears to be but one meaning of which these words are susceptible, "To the saints existing and faithful in Christ Jesus." All other renderings proposed either do injustice to the Greek, or make the apostle say what it is not possible he should have said in conformity with his general teaching. This, the rendering of Origen, is natural and idiomatic. Its peculiarity is of course that it makes the substantive verb of the original more than a simple copula. It makes it a distinct predicate, pointing out a characteristic of the condition of those addressed. They have a being, a place, a name; they "are," they are "existing," in Christ Jesus. The expression is undoubtedly most peculiar, having probably no perfect parallel in the New Testament. Yet it is there, and no reading that we can adopt removes it. The view that we have taken of the destination of the epistle seems to some extent to offer an explanation. There was a special propriety in reminding the Gentile Christians that they existed, that they had a place, that they "were" in Christ Jesus. We see from the whole tone of the epistle that this was the very point on which they were perplexed. There was no doubt about the Jewish Christians. It is taken for granted by the apostle, and he repeats it more than once, that they were "near" (ii. 13, 17). What he had especially to enforce is that the Gentiles were "near" also. He did not require to say of the former what it was so needful to say of the latter. What he does say, indeed, might have been said equally of both. Both, when believing, "*were* in Christ Jesus." But the words have a peculiar force when applied to Gentile Christians who had been "strangers to the covenant of the promise," and who had to be encouraged to feel with greater depth and power than they yet experienced that they were partakers of the full privileges of those who were fellow-citizens with the saints and of the household of God. There is thus an emphasis on the *τοῖς οὖσιν.* The Gentile Christians are not merely in Christ, but in Him they "are." In Him they too have a real and genuine existence, such as those only have who are in covenant with God.[2]

Object of epistle.

II. *Object of the Epistle.*—This is much more definite than it is often thought to be. The apostle has something more precise in view than to set forth the glory of the redeemed and Christian standing of his readers (Meyer), or to describe the life by which the Christian community is marked (Schenkel), or to explain the ground, the course, and the end of the Christian church (Alford). It is not his purpose only to pour himself forth in adoring contemplation of the blessings received by us in Christ (Harless); and it is far too little to say that he desires to strengthen the faith and to encourage the hopes of those to whom he writes (Gloag). Even Canon Lightfoot seems hardly to give a special enough object to the epistle when he finds its principal theme in "the life and energy of the church as dependent on Christ" (*On the Coloss.*, p. 329). These views may be all partially correct; but they are not enough. In this very setting forth of the greatness of the church, in this description of her life, in this presenting of her to us in all the ideal glory of her state as united to her Lord, the apostle has a further and immediately practical aim—to show us that this ideal glory contemplated from the first the union of both Jews and Gentiles in equal enjoyment of the privileges of God's covenant, that to the completeness of the body of Christ the latter are as necessary as the former, and that it is only when both are *together* in Christ that his fulness is realized and manifested. It is God's eternal plan that all things shall thus be restored and united in the Beloved; and, unless they are so, frankly, freely, and fully, that plan will be defeated. Hence it is that the apostle begins by describ-

---

[1] Since this article was written, the writer's attention has been called to the fact that Ewald, in his *Sieben Sendschreiben d. N. T.*, 1870, has adopted the same view of the destination of the epistle. He had not done so in his *Geschichte d. V. I.*, and the writer was not aware of the fact. Ewald, at the same time, attributes the epistle to a disciple and friend of the apostle, writing 70–80 A.D. He urges that St. Paul himself never wrote except to distinct churches (p. 157). But that very circumstance would surely have led any one writing in his name to adhere to the apostle's practice, and to avoid exposing his epistle to the suspicion which a departure from it could not fail to awaken. Why, too, if the writer adopted from Col. iv. 7 the idea of sending the epistle by Tychicus, does he not adopt from Col. i. 1 the idea of uniting Timothy with himself in the salutation?

[1] We are not without distinct examples of a use of the substantive verb approaching extremely near to this in the epistle to the Colossians, written at the same time as the epistle to the Ephesians. In ii. 3, ii. 10, and iii. 1 of that epistle the "are" and "is" are not to be connected with "hidden," "fulfilled" (Authorized Version, "complete"), or "sitting." These are all secondary predicates. The first predicate is the substantive verb, to which the others are added. The treasures of wisdom spoken of "are" in Christ, and are "hidden;" the Colossian Christians "are" in Him, and are "fulfilled:" Christ himself "is" when the things above are, and He is there "sitting" at the right hand of God (comp. Lightfoot, *in loc.*). Even in the Ephesian epistle itself, we have something of a similar kind. The Authorized Version of ii. 5 conveys a very imperfect idea of the Greek. The words there used do not mean "by grace ye are saved," but "by grace ye are, saved men." With such examples before us we need have less difficulty in putting Origen's metaphysical meaning into the "are" of i. 1; nor does there seem to be so much over-refinement in this notion as is often thought. If the Almighty chose for Himself the name I AM, why may not His people be said to "be" in Him? All, however, that we urge is, that such a use of the verb has more than ordinary force when applied to Gentile believers. I AM is a covenant title. No one doubted that the Jews were within the covenant; what needed enforcement was that the Gentiles were not less so.

Analysis of epistle.

ing in the loftiest language that realizing of the Almighty's purpose formed before the foundation of the world which was to be effected in "a" (not "the," for it is the thought of God with which we are dealing) "dispensation of the fulness of the seasons" (not "times"), when He would "sum up," or gather together under one head, "all things in the Christ, the things in heaven and the things upon the earth" (i. 3–10). Hence it is that Israel "also" (i. 11), which had before hoped in the Christ, had been made an inheritance in Him; but not Israel alone, for the Gentiles "also" (*καὶ ὑμεῖς*) had been made a similar inheritance, "sealed with the Spirit of *the promise*," and to the same end, "the praise of the glory of God's grace" (i. 10–14; comp. especially verses 12 and 14, and note the article before *δόξης* in verse 14). Therefore he prays that the God of our Lord Jesus Christ, "the Father of the glory," will reveal this knowledge fully (*ἐπιγνώσει*) in them, that so they may understand the exceeding greatness of His power which He wrought in Christ, when He raised Him from the dead and made Him to sit at his right hand in the heavenly places, constituting him Head over all things to the one church which is his body, the *pleroma* of Him whose *pleroma* is only reached when all things in all are "fulfilled in Him" (i. 15–23). This participation in the *pleroma* had been bestowed on them, Gentiles though they were (*ὑμᾶς* emphatic at ii. 1), when they, in the same manner as the Jews (*καὶ ἡμεῖς*, ii. 3), had been quickened together with the Christ, been raised from the dead, and been made to sit together in the heavenly places in Christ Jesus, this new and higher life being nothing more than the execution of God's great design (ii. 1–10). The apostle next makes a practical appeal to his readers, as Gentiles, calling on them to remember their present as contrasted with their former state, especially in this respect, that the same Lord who was the peace of the Jews was also their peace,[1] that they who had been afar off were now, as well as those who had been nigh, united in one new man, having access in one spirit to the one Father, and that now even they were fellow-citizens with the saints, members of the family of God, resting on the one foundation on which every building (not "the whole building" of Authorized Version), Gentile as well as Jew, grows up a part, fitly framed to the other parts, of one holy temple in the Lord (ii. 11–22). At this point the apostle seems to have been about to address to them the practical exhortation which meets us only at iv. 1, but he is again carried away by the thought of the great mystery which fills his mind. He turns to it therefore anew, only looking at it first as committed to him rather than in its effects on them. Yet it is the same mystery as that of which he had already spoken, that the Gentiles were made fellow-heirs and fellow-members of the body and fellow-partakers (mark the repeated *σύν* used with such striking frequency in this epistle) of the promise in Christ Jesus through the Gospel, and bursting forth into a prayer to the Father, of whom every family (not "the whole family" of Authorized Version) in heaven and on earth is named, that Christ may dwell through faith in their hearts in love, so that they may be fulfilled unto all the fulness of God (iii. 1–19). A doxology follows, where the singular prominence of the thought of the church in St. Paul's mind at this moment, shown by the mention of it before the mention of Christ, "in the church and in Christ Jesus" (v. 21), ought not to escape the notice of the reader (iii. 20, 21).[2] Even at the beginning of chap. iv., where the practical exhortation, suspended for a time, is taken up, the apostle has this unity that is in Christ still pressing upon his thoughts; for he no sooner mentions the unity (verse 3) than in the fulness of his heart he hastens to enlarge on it; and, recalling all the gifts which Christ had bestowed upon His church, he speaks of them as given to secure that we may "all," that is again, Jewish and Gentile Christians, attain unto the unity of the faith and of the knowledge of the Son of God, unto a full-grown man, unto the measure of the stature of the *pleroma* of Christ, from whom the whole body, by means of its several joints of supply, of which the Gentiles are one as well as the Jews (mark the *πάσης ἁφῆς* of verse 16), maketh the increase of the body unto a building up of itself in love (iv. 1–16).

It is not necessary to analyze further the teaching of this epistle, the remainder consisting of practical exhortations. What has been said is sufficient to show that one great thought runs through it all not so much the glory of Christ in Himself, as that glory realized in the church which is His body, in which the scattered "buildings" are united into one holy temple, the scattered "families" into one great family, the scattered "joints of supply" into one strong and vigorous body; and all this in Jesus Christ, whose glory is only accomplished, only reaches its *pleroma*, when this is done.

Place of epistle in Pauline teaching.

More, however, has to be said, for it is obvious that the description thus given of the glory of the church is not given for its own sake only. It is neither a pious meditation nor the splendid vision of an ecstatic hour. It has all a practical bearing upon Gentile Christians. It is to show them that their calling into the church is no accidental, doubtful thing. It is a part of God's eternal plan, the execution of which is essential to the accomplishing of the glory of the Christ and of Himself in Him. Whatever, therefore, was their past state of alienation, it could only be temporary. They must have their full share in the privileges of those who are one with God, must be an integral portion of the one body of His Son. None can be more near than they, for none in whom Christ is revealed can be more near than others in whom the same revelation has been made. Let them dispel their doubts, rest in the assurance that He who is the peace of Israel is also their peace, and walk worthy of Him whose *pleroma* they help to "fulfil." The whole is the practical unfolding and application of the thoughts which filled the apostle's mind in his epistle to the Colossians. The great importance to be attached to the Ephesian epistle in the construction of the Pauline system of doctrine will thus be apparent. It presents to us the realizing of that dispensation of God which belongs to the fulness of all preceding "seasons" (i. 10), which is to exhibit the exceeding riches of His grace to all ages that are to follow, one succeeding another, without end (ii. 7; mark the compound, not the simple verb, *ἐπερχομένοις*). It takes up everything that went before; and nothing can be added to what it contains. It sets before us the completion of an edifice whose foundations had been laid in a past eternity, and which was to stand for ever. It is especially the storehouse of truth connected with the church, using that word in its most comprehensive sense, for it treats of all the most important features of her condition, her foundation, spirituality, unity, organization, aim. The consequence is that the nature of the spiritual life is brought out in this epistle to a wonderful degree. Nowhere in the writings of St. Paul is such frequent allusion made to the work of the Spirit in the soul and in the church. It would seem as if the apostle, feeling that in previous epistles he had said all that he had to say of the *source* and *medium* of redemption, desired to dwell, before he closed his labors, upon its *application*, to contemplate fully not merely the love of God and the grace of Christ, but the power of the Spirit, as He enlightens, renews, seals, and fills the heart.

Relation to Colossians.

III. *Relation to the Epistle to the Colossians.*—We are thus prepared to examine the relation of our epistle to the epistle to the Colossians. The complaint of De Wette upon this point has been echoed by many later writers. The resemblances between the two epistles are said to be so great that the former must be regarded as a mere verbose expansion of the latter. Even those by whom the authenticity of the Ephesian epistle is defended admit the striking similarity; but they find the explanation of it in the fact that the two epistles were written at the same time, when the same ideas were in the author's mind, and when he was writing to two churches in a similar condition. A long succession of writers from Paley onwards have adopted this line of defence, many of whom have at the same time rather inconsistently admitted that the epistle to the Ephesians shows no trace of the doctrinal errors combated in that to the Colossians, and that what may be called the doctrinal portion of the two Epistles exhibits differences at least as striking as the similarities. The real explanation seems to lie in a wholly different direction, and is to be found neither in attempting to weaken the force of the similarities, nor in urging, while admitting them, that the wants of the readers were the same. The truth is that there is no reason to doubt that the two churches of Laodicea and Colossæ, as might indeed from their proximity to each other have been expected, were in a very similar condition, both doctrinally and practically, and that the same great doctrines were in the apostle's mind when he wrote to both. This consideration explains the similarities which strike the reader; while the differences spring not from difference of doctrine, but from the wholly different and independent point of view from which the same doctrines are looked at in each epistle. Thus Col. i. 14 is much the same as Eph. i. 7; Col. i. 20 as Eph. i. 10; Col. i. 16 as Eph. i. 21; Col. i. 18, 19 as Eph. i. 22, 23; Col. ii. 13 as Eph. ii. 5; Col. ii. 11 as Eph. ii. 11; Col. i. 20 as Eph. ii. 16; Col. i. 25, 26 as Eph. iii. 2, 3; but a comparison of these passages will show that, whatever the resemblance be, they have in each epistle a distinct purpose of their own: in that to the Colossians to set forth the glory of Him in whom the whole church lives; in that to the Ephesians to show that this glory cannot be fulfilled except by the bringing of *all* into unity in His one church, so that there cannot be two separate communities, but only one body in Christ. In short, the epistle to the Colossians is occupied with Christ himself. In opposition to the Judæo-Gnostic errors prevailing in Colossæ; and doubtless in Laodicea also, the apostle sets forth in it Christ in His person, life, death, resurrection, and exaltation in heaven. He is the true solution of their religious perplexities. He is the one and only Mediator between God and humanity, the one and only principle of the divine life to which humanity is to be brought. The epistle to the Ephesians is occupied with the church. In opposition to the arrogance of Jewish and the fears of Gentile Christians prevailing in Laodicea, and doubtless in Colossæ also, the apostle sets forth in it the church in its unity.[1] It is the one body of Christ, and the Gentiles must be a constituent part of the body if the body is to be complete,—a part of the fulness of the *pleroma*, of Christ, if that *pleroma* is to be reached. They are not therefore to suppose that, because they were once far off, they are not now nigh, as nigh as those who claimed, and might appear, to have been always nigh in a sense peculiar to themselves.

---

[1] *εἰρήνην* ought to be read a second time after the second *καί* of ii. 17.

[2] The reading of the T. R. has here again to be amended by the insertion of a *καί* after *ἐκκλησίᾳ*.

Ephesians and Colossians complementary.

It will thus be observed that the two epistles of which we speak are in the strictest sense complementary to one another; and we thus better understand how it was that St. Paul directed that the two should be read together (Col. iv. 16). Without the other each was incomplete. But together they make up the complex thought, "I am the vine, ye are the branches;" "Abide in me, and I in you." Nor is it without interest to notice that this is not a solitary instance of such a relation between two different books of the New Testament written by the same pen. A similar relation exists between the gospel of St. Luke and the Acts of the Apostles, and between the gospel of St. John and the Apocalypse, In the first of each of the three pairs we have Christ the head, in the second His body which is the church. It will thus be seen, too, that, in the absence of direct historical evidence, we may be spared the inquiry as to which of the two epistles was written first. All inquirers allow that the interval between them was extremely short. The chief point of interest is that in this short interval the epistle to the Colossians is first in order of thought, though not necessarily in order of time. The inference of Harless from iv. 16 (*Eph. Brief*, Einl., p. 51) that, supposing the Ephesian epistle to be "that from Laodicea," it must have been written before the epistle to the Colossians, an order of writing which he rejects, may be weakly founded, but it may also be correct. There is nothing to hinder the supposition that with two aspects of the truth in his mind, one of which is logically prior to the other, the apostle might first transfer to paper the last of the two. The circumstances calling for it might at the moment seem to be the most urgent. The priority of the Colossian epistle in every respect worth speaking of will still remain, although we allow the correctness of the inference drawn by Harless from the verse referred to, and the argument for the identity of the epistle to the Ephesians with that "from Laodicea" will be unaffected by the admission.

Authenticity.

IV. *Authenticity of the Epistle.*—It is only in comparatively recent times that doubts have been entertained upon this point. Usteri, in his *Paul Lehrb.*, 1824, appears to have been the first to express them, although he did not hesitate to use the epistle for the purpose of his book. The same doubts were afterwards more fully expressed by Schleiermacher, in his *Einleitung ins N. T.*, from whose oral lectures, according to Bleek (Introd. Clark's Translation, ii. p. 39), Usteri had received his views. De Wette followed in successive editions of his *Einleitung*, from 1843 onwards, not, however, deciding against the epistle, but only questioning its authenticity on the ground of its want of specific purpose, its dependence on the epistle to the Colossians, its poverty of thought, and its divergence both in teaching and style from the genuine epistles of St. Paul. He was followed by Baur in his *Paulus*, 1845, and by Schwegler in his *Nachap. Zeitalt.*, 1845, these two critics connecting the language of the epistle with the Gnostic and Montanist heresies of the 2d century, and for the first time unhesitatingly rejecting it. Ewald agrees with Baur and Schwegler in denying the Pauline authorship of the epistle, but takes the date of its composition further back, ascribing it to "an unnamed disciple and friend of the apostle" desirous to speak in his spirit and name truths which St. Paul himself had been too much occupied with other things to utter (*Geschichte d. V. I.*, 1859, vii. p. 246–7). Lastly, Hilgenfeld may be mentioned, who, in his *Einleitung*, p. 669, etc., 1875, gathering together the objections of his predecessors, and adding one or two minor ones of his own, assigns the epistle to the Gnostic times of the 2d century, and supposes it to have been written by a Christian of Asia belonging to the Pauline school, who was desirous at once to regain for the apostle the alienated affections of the Asiatic Christians, and to compose the differences between the Jewish and Gentile sections of the church.

Objections answered.

Such being the state of the argument against the authenticity of the epistle, it will be seen that the more important objections have been already, by anticipation, met in the previous positive statements of the article.

Want of specific purpose.

(1.) In particular, it ought to be necessary to say little more upon what has been generally felt to be the most powerful of these, the want of specific aim betrayed by the epistle, and its dependence upon the epistle to the Colossians. A specific aim, however erroneously conceived, is distinctly attributed to it by its later opponents; and we have only to compare it a little more closely with the epistle to the Colossians in order to see that, so far from merely containing the teaching of that epistle in an extended form, it exhibits thorough independence. Its very resemblance to the Colossian epistle makes this the more striking, because it shows us not something entirely new, but that new use of old truths which is often more difficult to produce than what is wholly new. It is not thus that the imitator or forger discovers himself. To be able to wield a great doctrine in this way, to present it to one's self and others in different lights, to apply it to varying circumstances, indicates a full and original possession of it. An imitator would of necessity have repeated what had been said before. He would have shown no originality or power in his treatment of the doctrine, and we should have received at his hands nothing but broken and imperfect fragments of what he had not himself assimilated. No traces of such weakness meet us here. We are in the presence of a master who has felt the fulness of the truth proclaimed by him, and who can see with his own eyes the different applications of which it is susceptible. Careful attention, again, to the passages quoted in support of the assertion that the Ephesian is not merely a reproduction of the Colossian epistle, but one indicating comparative poverty both in ideas and words (such as Eph. iii. 15 compared with Col. ii. 19; Eph. i. 17, 18 compared with Col. i. 9) will show that the richness of thought and language is often on the side of the former of the two. But the true answer to the objection is to be found not in any attempt to exalt either epistle at the expense of the other, so much as in marking the independent handling by both of the closely related truths with which they deal. Both will then appear in the light in which even Baur was disposed to regard them, "twin brothers coming together into the world" (*Paulus*, p. 455); and the question will no longer be one of copying, but of authorship later than the apostolic age.

Relation to Gnosticism.

(2.) This, accordingly, is the objection that next meets us. It is urged that the epistle to the Ephesians bears evident marks of having sprung up in the midst of the Gnostic heresies of the second century. The peculiar phraseology of many parts of the epistle is supposed to confirm this. Thus we are prepared by the words of iv. 14 to suppose that the writer has false teachings in his eye; and when we find him speaking as he does of "the mystery" of God's will (i. 9, comp. iii. 4, 9, v. 32, vi. 19), of the *"pleroma,"* that favorite term of the Gnostic systems (i. 23, iii. 19, iv. 13; comp. iv. 10, v. 18), of the "æon" of this world (ii. 2), the "æons" (ii. 7, iii. 9, 11), the "æon of the æons" (iii. 21), of "the prince of the power of the air" (ii. 2), of "the principalities and the authorities in the heavenly places" (iii. 10, comp. i. 21, vi. 12), of the "knowledge" (iii. 19) and the "full knowledge" (i. 17, iv. 13) to which Christians are to come, and of the "manifold wisdom of God" (iii. 21), the conclusion is considered irresistible, that we have in all this an opposition to Gnosticism, and a date later than the first century. We shall not attempt to deny the probability that there is a reference to Gnostic errors in expressions such as these. To say that they were originally employed by the apostle in order to unfold after his own manner the truth that he had to proclaim, and that they were then, in speculative abuse, made the foundation of, or essential elements in, Gnostic systems is unnatural. They are too peculiar, too different from the language of St. Paul in his earlier epistles, to permit such an explanation. Reference to what is known to us as Gnostic error there must be in them; and could it be shown that such terms came first into existence with the Gnostics of the second century we should at once give up the argument. The whole question is thus one of date. Had such ideas or words existence in the apostolic age or had they not? Answer must be made in the affirmative. Some of the expressions referred to, "mystery," "æon," "knowledge," "full knowledge," "wisdom," occur with remarkable frequency in St. Paul's undisputed epistles to the Romans, Corinthians, and Galatians. "The prince of the power of the air" combined with "the world-rulers of this darkness" (Eph. vi. 12) presents only an unmistakable parallel to "the prince of this world" in the gospel of St. John (xii. 31, xiv. 30, xvi. 11), a gospel which, in the present state of criticism upon the point, it would be absurd to bring down to the middle of the second century. Speculations, again, regarding the different orders of the celestial hierarchy, in regard to its thrones and dominions and principalities and powers, in regard also to the worshipping of angels, can be traced to the very confines of the apostolic age; and from the masterly dissertation on the word *pleroma* attached by Canon Lightfoot to his epistle to the Colossians, it will be seen what a high probability there is that that word belonged to the apostolic age itself (comp. Burton's *Lectures on the Gnostic Heresies*, Lect. v.).

---

[1] A distinct intimation of the arrogance with which the Jewish looked down upon the Gentile Christians and of the contemptuous language which they used concerning them, is afforded by Eph. ii. 11 (comp. Meyer *in loc.*).

It thus appears that these Gnostic ideas were in circulation before the apostolic age was out. That it was later before they were combined and elaborated into the systems now known as the Gnostic systems, and that the elaboration of these systems may itself have been promoted by the use in the sacred writings of the terms mentioned, is no doubt true; but that is no proof that the ideas themselves did not possess at the earlier date a powerful hold over the minds of men. If so, then the province of Asia was one of the great centres of their influence. Its cities were the meeting place of all eastern as well as western thought; and in them, far more than in Rome or Corinth or Thessalonica or Galatia, Gnosticism found at once a home and a starting-point for further progress. What, then, was an apostle to do when he went to places where such thoughts prevailed, and where they were injuriously affecting the life of the church? Exactly what St. Paul did in the epistles to Laodicea and Colossæ. The new terms used by him came from the new teaching made necessary by the places and the time. As he thought of the wants of those to whom he wrote, he saw that the truth committed to him could meet their more speculative errors, could satisfy their more speculative wants, as fully as it had met and satisfied necessities of a still earlier and simpler kind. He learned to see more clearly, to estimate more highly, the grandeur of his trust. He hastened, therefore, with it to the rescue; and, like any one on whom a new vision of divine truth has dawned, he did it with an exuberance of language, with a power of expression, with a swing of exultation, such as he had only on rare occasions exhibited before. Nor only so. The very form of his teaching was modified, and took traces of the speculations it was designed to counteract. The spectacle is a most interesting one, and ought to be most encouraging and quickening to Christian faith. The truth does not differ in the epistles to which we allude from what it was in earlier epistles by the same author. But there is growth, development. There is a *theology* in the proper sense of the term even in the New Testament itself—a spur to theologians of every age to adapt in like manner the eternal truth to the wants of their own times, and to construct a theology which shall be living, because, while founded on the great facts of the gospel, it is cast in the mould which their times demand.

Harmonizing tendency.

(3.) Hilgenfeld's view as to the harmonizing tendency of the epistle, as to its effect in uniting opposing parties into one catholic church, has also been substantially met. The epistle is throughout addressed to one class of persons, not to two classes; and there is no allusion whatever to any factious spirit exhibited by the former. That the church of Christ is one was surely a truth which sprang, not out of the controversies of hostile parties, but out of the teaching of Christ Himself in the gospels (comp. esp. John x.), and which is nowhere more strenuously insisted on than in the acknowledged epistles of St. Paul (Rom. xii., 1 Cor. x. xi. xii.). The peculiarity here is not in the thought itself, but in the mode in which the thought is presented; and the explanation of this is to be found in the considerations already adduced.

Peculiar words and thoughts.

(4.) Other objections to the authenticity of our epistles, such as its ἅπαξ λεγόμενα and its un-Pauline statements, may be passed over in a few words. The former are certainly not more numerous than may be expected when we remember the peculiar state of circumstances to which the apostle addresses himself. The most important examples of the latter are—ii. 20, "apostles and prophets" as the foundation, the citation in v. 14, which it is said cannot be identified, and the mode in which justification is alluded to in ii. 8, while Hilgenfeld, not satisfied with these examples from Baur, finds a proof that we have a Pauline disciple rather than St. Paul himself before us in iii. 8, "the least of all saints," instead of "the least of the apostles" as in 1 Cor. xv. 9. It is hardly possible to follow such minute objections here. For the first compare 1 Cor. xii. 28; for the second we may compare Isa. lx. 1, 2, and may remember the freedom with which the Old Testament is often quoted in the New; for the third it may be noticed that in a statement which Baur finds unfavorable to Pauline authorship, Hilgenfeld finds a clear proof of Pauline discipleship (p. 677); and for the fourth that, in the verse in Corinthians immediately preceding that referred to, the apostle designates himself "an abortion," a much more humbling expression than "the least of all saints." Those who allow force to what has been said on the first three objections will not be stumbled by such minor difficulties. Those who refuse it will feel that what they consider their unanswered objections are sufficient to justify their position. We may omit further notice of them, and may simply urge upon the point before us that, the field being thus cleared of the objections, we are thrown back upon what is really the main ground upon which the New Testament books are to be accepted, the tradition of the church. It is quite a possible thing that in a particular case, whether relating to the Old or New Testament, that tradition may be incorrect. All fair criticism, therefore, is to be welcomed; but, when no good objection to an accepted opinion of the church has been established, there is everything to lead us to acquiesce in it with confidence. The early church was not so thoughtless upon these points as she is often said to have been. She guarded her treasures with great care, and was very watchful lest anything should be placed amongst them in whose genuineness she had not every confidence. What the tradition of the church is in the present instance is not doubted; and it is unnecessary to enter here into detail. The ordinary introductions to the New Testament and the prolegomena of the different commentators on the epistle contain all the facts.

Occasion, place, and date.

V. *Occasion, Place, and Date of the Epistle.*—It will not be necessary to say much upon these points. The occasion was evidently afforded by the despatch of Tychicus and Onesimus to Colossæ (Col. iv. 7–9; comp. Eph. vi. 21). By them St. Paul would send letters to the Colossian church and to Philemon, one of its members. He embraced the opportunity of writing also to the Gentile converts of Laodicea, and of the neighboring church at Colossæ; and that epistle, not being written to a church, but being primarily intended for a section of the Christian communities of the two cities, had no name of a place inserted in it as the object of its destination. In this respect it resembles, and may be regarded as a counterpart of, the epistle to the Hebrews.

As to the place where it was penned, the question lies between Rome and Cæsarea, for St. Paul was a prisoner at the time (iii. 1, iv. 20), and his imprisonment in one or other of these two cities must be referred to. The question has been decided by some in favor of Cæsarea on such grounds as the following:—that Cæsarea was nearer Asia than Rome was, and that thus the spiritual condition of the Asiatic churches would be more easily known to the apostle at the former than the latter city; that for the same reason Onesimus, who we know from the epistle to Philemon was met by the apostle in the place of his imprisonment, would be more likely to flee from his master to Cæsarea than to Rome; that the words of the epistle to Philemon "departed for a season" (v. 15) imply a shorter absence than is involved in the thought of Rome, and therefore point to Cæsarea, because it is not likely that St. Paul would have so many of his friends beside him at Rome as he had when he wrote the three letters of which the epistle to the Ephesians is one—Tychicus, Aristarchus, Mark, Jesus Justus, Epaphras, Luke (see the epistles); because if the apostle wrote from Rome, Tychicus and Onesimus would pass through Ephesus or Laodicea on their way to Colossæ, and we ought therefore to find Onesimus commended to the church there, whereas, if the apostle wrote from Cæsarea, his two friends would be at Colossæ first, and Tychicus, leaving Onesimus behind, would proceed thence alone; because the words "that ye also may know" (vi. 21) lead to the inference that others had been told of the apostle's state, who can only be the Colossians, visited on the way between Cæsarea and Ephesus; because it would seem that the apostle intended at the close of his imprisonment to visit Phrygia (Philemon i. 22), whereas we learn from Phil. ii. 24 that at the close of the Roman imprisonment he intended to visit Macedonia. In so far as these considerations relate to the thought of a place where information as to the state of distant churches could most easily be had, where friends would be most likely to congregate, or in which fugitives would most readily seek refuge, it is obvious that they are better fulfilled by Rome than by Cæsarea. The idea again of visiting Macedonia might be fulfilled by its being taken on the way to Asia. No stress can be laid on the omission of the name of Onesimus, and the meaning of vi. 21 does not seem to be that ye "also," in addition to the Colossians, *of whom nothing had been said*, "may know," but that ye, of whose state I have spoken freely as one thoroughly acquainted with it, may "also" know my state. The decisive argument, however, for Rome rather than Cæsarea, as the place whence the epistle was written, arises from the fact that all the epistles known as those of the imprisonment must have been written from the same place, and that this epistolary activity is more naturally connected with Rome than with Cæsarea. In the former city the apostle had much greater freedom than in the latter, both to receive intelligence and to write to friends (Acts xxviii. 30, 31). Upon the whole, the commonly entertained belief that our epistle was written at Rome may be received without hesitation. If so, it was written towards the close of the apostle's captivity in that city, 63 A.D.

Literature.

Literature.—In dealing with an epistle such as this it is unnecessary to devote much space to the literature of the subject. Any one desirous to study the epistle will gradually become acquainted with it as he pursues his task. But references may be made to the various Introductions to the New Testament by such writers as De Wette, Bleek, Davidson, Hilgenfeld, Gloag, and to the leading commentaries, those of Rückert, Harless, De Wette, Stier, Meyer, Eadie, Ellicott, Shenkel in Lange's *B. Werk*, Ewald, in an appendix to his *Sieben Sendschreiben d. N. T.*, Bleek. The student will not fail to consult Baur in his *Paulus*, and the *Nachapost. Zeitalter* of Schwegler. Nowhere will a larger amount of valuable matter bearing on the epistle be found than in Canon Lightfoot's *Commentary on the Colossians*, with its introduction and appendices. (W. MI.)

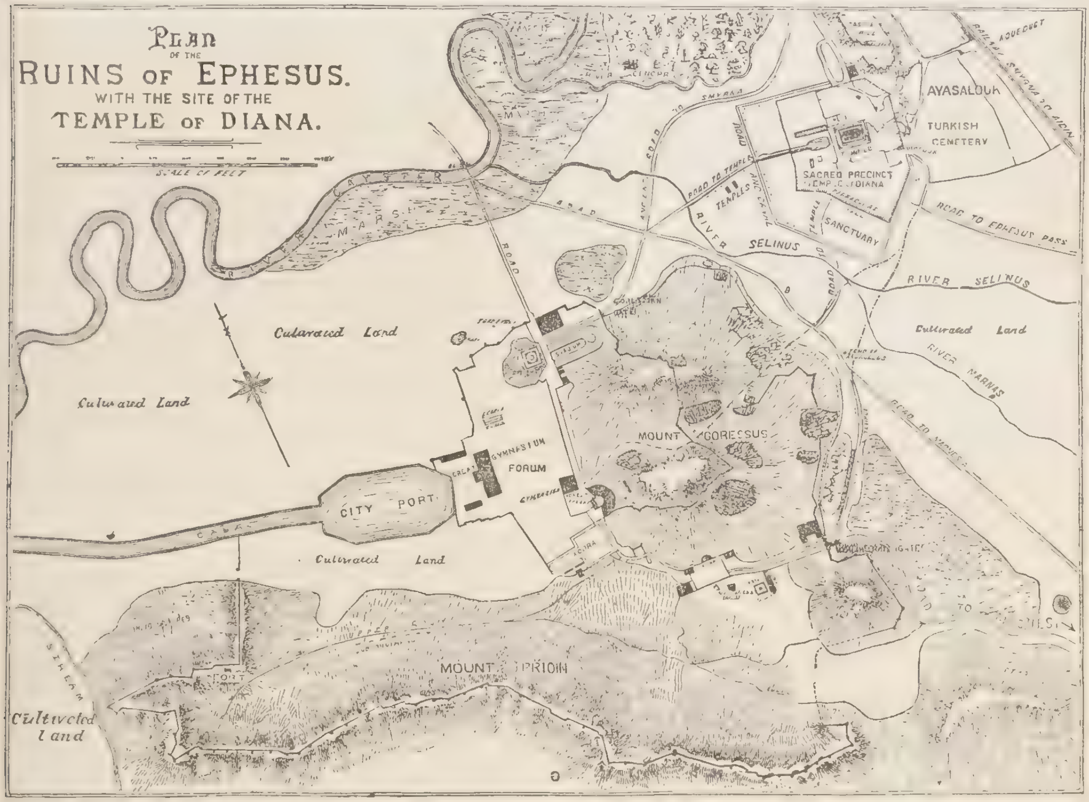
EPHESUS, a very ancient city on the west coast of Asia Minor. It was situate on some hills which rose out of a fertile plain near the mouth of the river Caÿster, while the temple and precincts of Artemis, or Diana, to the fame of which the town owed much of its celebrity, were in the plain itself, at the distance of about a mile. The situation of the city was such as at all times to command a great commerce. Of the three great river basins of western Asia Minor, those of the Hermus, Caÿster, and Mæander, it commanded the second, and had ready access by easy passes to the other two, besides being the natural port and landing-place for Sardes, the capital of the Lydian kings.

The earliest inhabitants assigned to Ephesus are the mythical Amazons, who are said to have founded the city, and to have been the first priestesses of the Asiatic Artemis. With the Amazons we hear of Leleges and Pelasgi as in possession. In the 11th century B.C., according to tradition, Androclus, son of the Athenian king Codrus, landed on the spot with his Ionians, and from this conquest dates the history of the Greek Ephesus. But here the Ionians by no means succeeded in absorbing the races in possession or superseding the established worship. Their city was firmly established on Coressus and Prion, between which hills lies the city harbor; but the old inhabitants still clustered in the plain around the sanctuary of Artemis. When, however, we call the deity of Ephesus Artemis, we must guard against misconception. Really she was a primitive Asiatic goddess of nature of the same class as Mylitta and Cybele, the mother of vegetation and the nurse of wild beasts, an embodiment of the fertility and productive power of the earth. She was represented in art as a stiff erect mummy, her bosom covered with many breasts, in which latter circumstance Guhl sees allusion to the abundance of springs which arise in the Ephesian plain. The organization of her worship, too, of which more below, was totally unlike anything Hellenic. It was only by reason of their preconceived ideas that the Ionians found in this outlandish and primitive being a form of Artemis their conductor. The entire history of Ephesus consists of a long series of struggles between Greek and Asiatic manners and religions, between the ideas of the agora and the harbor and those of the precincts of the goddess. This struggle can be traced throughout in the devices of the Ephesian coin, the type of the goddess which appears in it becoming at times Asiatic, at times Hellenic, according to the predominant influence of the period.

For centuries after the foundation of Androclus, the Asiatic influences waxed and the Greek waned. Twice in the period 700–500 B.C. the city owed its preservation to the interference of the goddess,—once when the swarms of the Cimmerians overran Asia Minor, and once when Crœsus besieged the town, and only retired after it had solemnly dedicated itself to Artemis, the sign of such dedication being the stretching of a rope from city to sanctuary. Crœsus was eager in every way to propitiate the goddess, and as at this time her first great temple was building on the plans of the architect Chersiphron, he presented most of the columns required for the building as well as some cows of gold. It is probable that policy mingled with his piety, his object being to make Ephesus Asiatic in character, a harmonious part of the empire he was forming in hither Asia, and then to use the city as a port, and by such means counterbalance the growing power of Miletus and other cities of the coast. The mother-city of Ephesus, Athens, seems to have counterworked his projects by despatching one of her noblest citizens, Aristarchus, to restore law on the basis of the Solonian constitution. The labors of Aristarchus seem to have borne fruit. It was an Ephesian follower of his, Hermodorus, who aided the Decemviri at Rome in their compilation of a system of law. And in the same generation Heraclitus, probably a descendant of Codrus, quitted his hereditary magistracy in order to devote himself to philosophy, in which his name became almost as great as that of any Greek. Poetry had long flourished at Ephesus. From very early times the Homeric poems had found a home and many admirers there; and to Ephesus belong the earliest elegiac poems of Greece, the war songs of Callinus, who flourished in the 7th century B.C., and was the model of Tyrtæus. And yet that on the whole Crœsus was successful in his schemes seems certain. When the Ionian revolt against Persia broke out in the year 500 B.C. under the lead of Miletus, Ephesus remained submissive to Persian rule; and when Xerxes returned from the march against Greece, he honored the temple of Artemis, and even left his children behind at Ephesus for safety's sake. After the great Persian defeat, Ephesus for a time paid tribute to Athens, with the other cities of the coast, and Lysander first and afterwards Agesilaus made it their headquarters.

In the year 356 B.C., on the same night on which Alexander the Great was born, an incendiary named Herostratus, wishing only to make his name famous, if even by a monstrous crime, set fire to that temple of Artemis which Chersiphron had planned, and which had been later enlarged or even rebuilt by Pæonius in the 5th century. With the greatest eagerness the Ephesians set about its reconstruction on a still more splendid scale. The ladies of the city sold their jewelry, and neighboring cities sent contributions, many of the massive columns being the gift of kings. Though Alexander the Great, after his victories, offered to pay the whole cost of reconstruction, on condition that he might inscribe his name as dedicator on the pediment, his offer was refused. The temple was rapidly completed, and was considered in after times the most perfect model of Ionic architecture, and one of the seven wonders of the world. The recent excavations of Mr. Wood have enabled us to form a fairly exact notion of its details, as will be seen below. The architect employed was Dimocrates, and Scopas was one of the sculptors employed in the decoration.

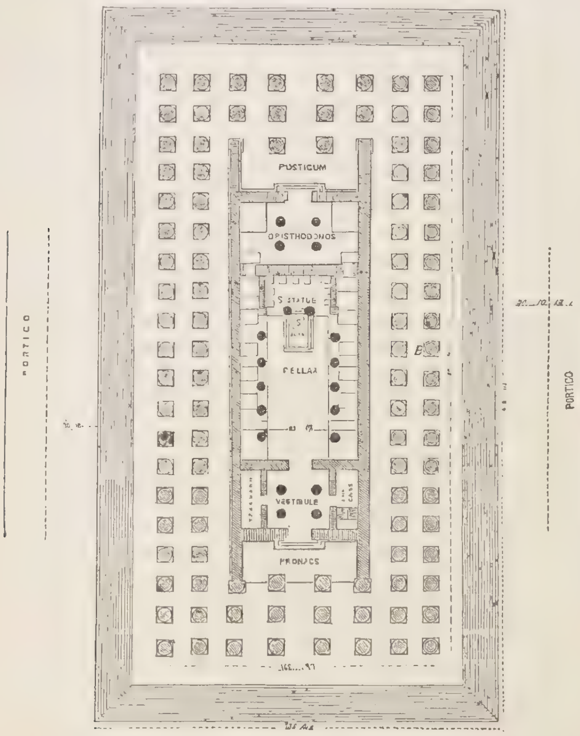
Alexander established a democratic government at Ephesus. Soon after his death the city fell into the hands of Lysimachus, who determined to impress upon the city a more Hellenic character, and to destroy the ancient barbarizing influences. To this end he compelled, it is said by means of an artificial inundation, the people who dwelt in the plain by the temple to migrate to the Greek quarter on the hill now identified as Coressus, which he surrounded by a solid wall. He recruited the numbers of the inhabitants by transferring thither the people of Lebedus and Colophon, and finally, in order to make the breach with the past complete, renamed the city after his wife Arsinoë. But the former influences soon reasserted themselves, and with the old name returned Asiatic superstition and Asiatic luxury. The people were again notorious for wealth, for their effeminate manner of life, and for their devotion to sorcery and witchcraft. After the defeat of Antiochus the Great, king of Syria, by the Romans, Ephesus was handed over by the conquerors to Eumenes, king of Pergamus, whose successor, Attalus Philadelphus, worked the city irremediable harm. Thinking that the shallowness of the harbor was due to the width of its mouth, he built a mole partway across the latter; the result, however, was contrary to his wishes, the silting up of the harbor with sand proceeding now at a greater pace than before. The third Attalus of Pergamus bequeathed Ephesus with the rest of his possessions to the Roman people, when it became the capital of the province of Asia, and the residence of the proconsul. Henceforth Ephesus remained subject to the Romans until the barbarian invasions, save for a short period, when, at the instigation of Mithridates, the cities of Asia Minor revolted and massacred their Roman residents. The Ephesians even dragged out and slew those Romans who had fled to the precincts of Artemis for protection, notwithstanding which they soon returned from their new to their former masters, and even had the effrontery to state, in an inscription preserved to this day, that their defection to Mithridates was a mere yielding to superior force. Sulla, after his victory over Mithridates, brushed away their pretexts, and after inflicting on them a very heavy fine, told them that the punishment fell far short of their deserts. In the civil wars of the 1st century B.C. the Ephesians were so unfortunate as twice to support the unsuccessful party, giving shelter to, or being made use of by, first Brutus and Cassius and afterwards Antony, for which partisanship or weakness they paid very heavily in fines.



Plan of Ephesus (copied by permission from Wood's *Discoveries at Ephesus*, Longmans, 1876).

All this time the city was gradually growing in wealth and in devotion to the service of Artemis, a devotion which had become quite fanatical at the time of St. Paul's visit. The story of his doings there need not be repeated; the supplement of them is, however, very suggestive,—the burning, namely, of books of sorcery to a great value. Addiction to the practice of occult arts was always general in the city. The Christian church which St. Paul planted was nurtured by St. John, and is great in Christian tradition as the nurse of saints and martyrs. It was, however, long before the spread of Christianity threatened the *cultus* of Artemis. The city was proud to be termed *neocorus*, or servant of the goddess. Roman emperors vied with wealthy natives in lavish gifts to her, one Vibius Salutaris among the latter presenting a quantity of gold and silver images to be carried annually in procession. Ephesus contested stoutly with Smyrna and Pergamus the honor of being called the first city of Asia; each city appealed to Rome, and we still possess rescripts in which the emperors endeavor to mitigate the bitterness of the rivalry. The Goths destroyed both city and temple in the year 262 A.D.; and although the city revived, it never recovered its former splendor. A general council of the church was held there in 341; but by the 15th century it had sunk into a wretched village, the name of which, Ayasaluk, is now known to be a corruption of the title of St. John, Hagios Theologos. The ruins of the temple, after serving as a quarry to the beautifiers of Constantinople, the Turkish conquerors, and the mediæval Italians, were finally covered deep with mud by the river Caÿster, and its true site was unsuspected until the laborious excavations of Mr. Wood were rewarded with success in the year 1869.

The organization of the temple hierarchy, and its customs and privileges, retained throughout an Oriental and somewhat ascetic tinge. The priestesses of the goddess, termed Melissæ or bees, were virgins, and her priests were compelled to celibacy. The chief among the latter, who bore the Persian name of Megabyzus and the Greek title Neocorus, was doubtless a power in the state as well as a dignitary of religion. Besides these, there was a vast throng of dependants who lived by the temple and its services,—*theologi*, who may have expounded sacred legends, *hymnodi*, who composed hymns in honor of the deity, and others, together with a great crowd of *hierodulæ*, who performed more menial offices. The making of shrines and images of the goddess occupied many hands. To support this greedy mob offerings were flowing in in a constant stream from votaries and from visitors, who contributed sometimes money and sometimes statues and works of art. These latter so accumulated that the temple became a rich museum, among the chief treasures of which were the figures of Amazons sculptured in competition by Phidias, Polycletus, Cresilas, and Phradmon, and the painting by Apelles of Alexander holding a thunderbolt. The temple was also richly endowed in lands, and possessed the fishery of the Selinusian lakes, with other large revenues. But perhaps the most important of all the privileges possessed by the goddess and her priests was that of *asylum*. Fugitives from justice or vengeance who reached her precincts were perfectly safe from all pursuit and arrest. The boundaries of the space possessing such virtue were from time to time enlarged. Mithridates extended them to a bow-shot from the temple in all directions, and Mark Antony imprudently allowed them to take in part of the city, which part thus became free of all law, and a haunt of thieves and villains. Augustus, while leaving the right of asylum untouched, diminished the space to which the privilege belonged, and built round it a wall, which still surrounds the ruins of the temple at the distance of about a quarter of a mile, bearing an inscription in Greek and Latin, which states that it was erected in the proconsulship of Asinius Gallus, out of the revenues of the temple. Besides being a place of worship, a museum, and a sanctuary, the Ephesian temple was a great bank. Nowhere in Asia could money be more safely bestowed than here; therefore both kings and private persons placed their treasures under the guardianship of the goddess.



Scheme of Temple of Artemis or Diana at Ephesus.

The government of the city is a matter of some obscurity. We know that for some time after its foundation it was ruled by kings of the race of Codrus, and afterwards by archons who belonged to the same stock. In the time of Lysander it was under an oligarchy; Alexander re-established the democracy. We have the titles of several magistrates in imperial times, but without exactly knowing their functions. The tumult raised by Demetrius against Paul was quelled by the town-clerk or recorder (γραμματεύς). Inscriptions mention archons, strategi, gymnasiarchs, pædonomi, and Asiarchs, besides the religious functionaries; but no doubt the chief power rested with the senate and the *demos*.

The topography of Ephesus was but very imperfectly known until the excavations conducted by Mr. J. T. Wood on behalf of the trustees of the British Museum during the years 1863–74. He first explored the Odeum and the Great Theatre situate in the city itself, and in the latter place had the good fortune to find an inscription which indicated to him in what direction to search for the temple, for it stated that processions came to the city from the temple by the Magnesian gate, and returned by the Coressian. These two gates were next identified, and following up that road which issued from the Magnesian gate, Mr. Wood lighted first on the tomb of Androclus, and afterwards on an angle of the peribolus wall of the time of Augustus. He next found and excavated the site of the temple of Artemis. He found remains of more than one temple; three separate floors being clearly distinguishable one above the other. Of these the lowest consisted of a layer of charcoal between two of putty. It is probable that this was the floor of the temple of Crœsus's time, which Chersiphron was said to have made with charcoal and fleeces. Above this lowest floor were two others of marble, which would seem to have belonged, one to the temple burned by Herostratus, the other to that erected on its ruins immediately afterwards. Of this latter building the remains were sufficient to enable Mr. Wood to restore it with considerable accuracy. The dimensions of it, taken at the lowest step of the flight which led up to the peristyle on all sides, were 418 feet 1 inch by 239 feet 4½ inches. The number of the external columns was 100, their height about 56 feet. It is observable that the dimensions given by Pliny seem to be in every case incorrect. The most remarkable fact about the columns is that many of them were sculptured with figures in high relief to a man's height above the ground; one was, we are told, chiselled by the sculptor Scopas, and certainly the existing fragments of sculptured columns now recovered and preserved in the British Museum are not the work of common hands. The fragments of sculptured frieze found in the excavations would seem to prove that the frieze was adorned with representations of Hercules, Theseus, and the Amazons. The *cymatium* was decorated with the conventional honeysuckle ornament, intercepted by fine lions' heads. The roof was covered with flat marble tiles. The whole edifice was octastyle, having eight columns at the ends, and dipteral, with two rows of columns all round. Fragments were also found which appear to belong to the 6th century, B.C., and as some of these are parts of sculptured columns, it would seem that the temple of Chersiphron had set to the later building the example of cutting reliefs on the main pillars.

The best works on Ephesus are those of Guhl, Falkener, Ernst Curtius, and J. T. Wood. The first of these writers has collected most of the ancient authorities; the last has been successful in topographical researches. The accompanying plans are from his book, and are inserted by his kind permission, and that of Messrs. Longmans & Co., publishers. The first gives the general plan of the city, and the road to the temple. The second gives the scheme of the temple, the fragments of walls and columns found by Mr. Wood in position being represented black. (P. G.)

EPHORI. This name, which exactly corresponds with the Greek *episkopos*, meaning *bishop* or *overseer*, was given to certain magistrates in many Dorian cities of ancient Greece. But the most prominent are the ephors of Sparta, who, whatever may have been their origin, appear during the times for which we have historical knowledge as the supreme power in the state, controlling alike its civil and military administration. When in the 3d century B.C. the complete humiliation of Sparta led the kings Agis III. and Cleomenes III. to resolve on restoring what they supposed to be the ancient constitution, their first blow was directed at the ephors, whom they charged with deliberate usurpation. According to their version (Plut., *Cleom.* 10) the ephors owed their existence to the Messenian wars, which rendered necessary the prolonged absence of the kings, who accordingly delegated to them their judicial functions; and the subordinate powers thus given were gradually extended until they became virtually absolute. Another tradition ascribed the institution of the ephors to Lycurgus himself. But if of Lycurgus we cannot be said to know anything, the lays of Tyrtæus, which alone give us any trustworthy information about the Messenian wars, say nothing as to the origin of the ephoralty. We can, therefore, do no more than trace the development of their powers during the ages for which we have genuine historical narratives.

Holding the country strictly as an army of occupation, the whole body of Spartans was formed internally into a close oligarchy, all the members of which had the same privileges and were subjected to the same discipline, with the exception of the kings and the ephors. But the two Heraclid kings, as representing the two rival sons of Aristodemus, generally held each the other in check, and thus added to the influence of the ephors. That the latter were originally subordinate is made plain by the statement of Xenophon (*De Rep. Lac.*, 15), that there was still in his time a monthly interchange of oaths, by which the kings pledged themselves to govern according to the laws, while the ephors on this condition undertook to maintain their authority. The ceremony had in Xenophon's days lost its meaning; but it pointed clearly to a time when the kings had been predominant. It further shows that from the first the ephors represented the whole body of the citizens; and the mode of electing them, which Aristotle ridicules as childish, attests their popular character. The general assembly might choose any one for the office, without any qualification of age or property, and without scrutiny. The restriction of their number to five had reference to the *polis* or city of Sparta, and the four hamlets which with it formed the stronghold of the Spartan oligarchy.

In their relations with the kings we find the ephors gradually acquiring greater weight, and exercising their power more decisively. Herodotus (vi. 56) speaks of the kings as still possessing the power of declaring war at their own will. But in the wars of which we have historical knowledge, not only is the decision given by the ephors, who may or may not have taken counsel with the senate and the assembly, but two of their number accompany the kings, who thus become simply leaders of the army, acting under the control of civil magistrates, until, after the unsuccessful expedition of King Agis against Argos in 417 B.C., a law was passed appointing ten commissioners to attend the kings in all their campaigns. The ephors were still further distinguished from all other citizens by the privilege of exemption from the public discipline. They also kept their seats on the approach of the kings, while custom required the latter to rise if the ephors passed by. In the relations of Sparta with foreign states generally we find the public business carried on not by the kings but by the ephors, who treat with ambassadors, determine the number of troops to be levied, decide on their destination, and conclude treaties.

Of the five ephors, the first in rank, probably as being the first elected, gave his name to the year, like the Archon Eponymus at Athens. The whole college met in the Archeion, which answered to the Athenian Prytaneion. They exercised jurisdiction in all important civil suits, criminal cases and capital offences being carried before the senate. With this jurisdiction they combined a large censorial power, which extended even to minute details in the life of the citizens. Their right of scrutiny into the conduct of magistrates they could exercise even during their term of office. Not only could they depose such as they found unworthy, but they might summon the kings before their tribunal, or bring a capital charge against them before the Spartan assembly. With the gradual slackening of the system of public discipline, and with the increasing license which their position enabled them to assume, their power became an intolerable burden, at least to the kings; and Cleomenes cut the knot by massacring the whole college, and abolishing the office.

EPHORUS, a Greek historian of Cumæ in Æolis, flourished about 408 B.C. His father's name was Demophilus or Antiochus; and he studied along with Eudoxus and Theopompus under the philosopher Isocrates.

The chief work of Ephorus was a history of the wars between the Greeks and Persians, in which, like Herodotus, he introduced the description of foreign and barbarous nations in the form of episodes. Only a few disconnected fragments of it have come down to us. According to the scheme of Marx, the first book contained an account of the return of the Heraclidæ into the Peloponnesus, and the change of affairs consequent upon that event; the second was occupied with the state of the rest of Greece; and the third narrated the departure of the Greek colonies to Asia. In these three books he thus brought the history of Greece and Asia down to that period when they began to assume a peaceful aspect, probably a few years before the commencement of the Median war. After this introduction he proceeded to describe separately each country which subsequently became the scene of important transactions,—in the fourth book Europe, in the fifth Asia and Africa; and in the sixth he probably gave an account of the nation of the Pelasgi. The seventh book contained the most ancient traditionary notices of Sicily, and probably all he could collect respecting the original inhabitants of Italy and the adjacent islands. The eighth book narrated the various changes of fortune to which those nations had been subject who in succession held the supreme command in Asia, namely, the Assyrians, Lydians, and Persians. The fragments which remain refer principally to the history of Crœsus. In the ninth book he described the origin, changes, and migrations of the Amazons, Scythians, and other nations who inhabited the coasts of the Pontus and those northern countries, whence, through Thrace and Thessaly, he returned to Greece and its affairs. Then it was that Ephorus reached the period when, like every Greek historian, he imagined that the transactions of the whole world became centred in the causes and events of the Persian war; and then also he began to treat his subject with more copiousness, for we find that, while in his tenth book he had already brought down his history to the times of Miltiades, about 490 B.C., in his eighteenth book he had reached Dercyllidas, 399, and in his twenty-fifth he had arrived at the battle of Mantinea, 362. The part of the thirtieth book which gave an account of the sacred war was composed, not by Ephorus himself, but by his son Demophilus. At the conclusion of the war Ephorus took up the thread of the history, and continued it to the siege of Perinthus, 340 B.C. According to Diodorus Siculus, the whole period treated of was 750 years.

For a more full description of the life of Ephorus, and a collection of the fragments of his history which have been preserved, the reader may consult *Ephori Fragmenta*, by Meier Marx, 1815; Creuzer, *Symbolik und Mythologie der alten Völker, besonders der Griechen*, 1819; Vossius, *De Historicis Græcis*, 1651; and Ulrici, *Charakteristik der antiken Historiographie*, 1833.

EPHRAEM SYRUS, or Ephraim the Syrian, flourished in the 4th century of the Christian era, acquired great renown among his contemporaries, and has since been esteemed one of the most celebrated fathers of the church. So highly was he honored that, according to the testimony of Jerome (*Script. Eccl.*, c. 115), his homilies were read in many of the churches of Greece immediately after the reading of Scripture. His name is almost never mentioned without the prefix *Mor* or *Mari* (master). Of the events of his life but little is known, and what has been handed down to us is much lessened in value by an admixture of apocryphal stories. The following is a translation of a short memoir of Ephraem from a Syriac source. The original is found in a 14th-century MS., which is printed by Assemani in the Roman edition of Ephraem's works.

> "The blessed Mor Ephraem was a Syrian by birth; his father was of Nisibis, his mother of the city Amida. His father was an idolatrous priest, and they lived in the time of Constantine Victor [*i.e.* the Great]. His father expelled him from home because he was not obedient to his wicked will; he therefore went and lived with the holy Mor Jacob, the bishop of Nisibis, and led an entire life of godliness until the time of Jovian [when Nisibis was, in 363, surrendered to the Persians]. He then left that place and came to the city Edessa, where he received the gift of the Holy Ghost, and abundantly supplied the church with the gifts and doctrine of the Spirit. After a time he went to the desert of Egypt, and from thence to Cæsarea of Cappadocia to Basil, and received from him the imposition of hands for the diaconate. He immediately returned to Edessa, and ended his life there in the year 684 (of the Greeks), on the ninth day of Haziron (June), that is, in the year 373 of the advent of our Lord."

A much longer life, also extant in Syriac, gives no more historical data which can be relied on; and the so-called testament or will, which professes to contain curious autobiographical matter referring to his religious history and feelings, is of doubtful authenticity. A careful recension of the piece is given by Overbeck in his *Opera Selecta*. The statement of the manuscript just quoted, that Ephraem was born at Nisibis, has the authority of Sozomenus in its favor; and Ephraem himself, in his commentary on Genesis, refers to Mesopotamia as his native country. The Syrian sources are unanimous about the date of his death, and, according to Dr. Bickell, the dubiety of Rödiger has arisen from a misinterpretation. At Edessa Ephraem adopted a monastic life, and is said to have dwelt in a cave near the town. The story of his visit to Egypt is probably mythical. Though the external facts of Ephraem's life are thus few and doubtful, there is no question of the manner in which he impressed his genius and spirit upon his own age, or of the great value of his literary remains. His popularity and influence among the luxurious and refined people of Edessa were very great. He wrote against Julian, and combated the heresies of Bardesanes the Gnostic philosopher, of the Arians and Sabellians, of the Manichæans and Novatians. Whether he was acquainted with Greek or not is a matter of dispute which can hardly be decided by his writings; but Geiger has rendered it probable that he had come considerably under Jewish influence, not a few words being employed by him in an acceptation foreign to Syriac, but well known in the Hebrew of his time and country. His works consist of commentaries, sermons, tractates, and hymns. Of many the original Syriac appears to have perished; and they are only preserved in Greek, Latin, Armenian, or Slavonic. The greater proportion of the sermons and tractates are composed in a metrical form, the verses being of various measures—tetrasyllabic, heptasyllabic, or octosyllabic,—and arranged in strophes varying from four to twelve lines. Rhyme and assonance are both employed at irregular intervals, and, as Geiger has pointed out in the *Ztschr. d. D. Morg. Ges.*, 1867, a considerable number of the pieces are alphabetical or nominal acrostics, though the fact is sometimes disguised in the MSS. by the misarrangement of the lines. That he has applied his verse to such prosaic purposes as the refutation of heresy and the inculcation of orthodoxy would seem of itself to make heavily against Ephraem's reputation as a poet; but it is impossible to read some even of his most unpromising pieces without admitting that he has a genuine poetic gift. Some of his hymns on the death of children may rank for pathos and happy simplicity with the finest lyrics of their class; and there can be no doubt of the imaginative force of such lines as the following:—"For before that time Death by this was made arrogant, and boasted himself of it, 'Behold priests and kings lie bound by me in the midst of my prisons.' A mighty war came without warning against the tyrant Death; and as a robber, the shouts of the foe surprised him and humbled his glory. The dead perceived a sweet savor of life in the midst of Hades; and they began to spread the glad tidings among one another that their hope was accomplished." Several of the Nisibean poems are impassioned odes on events in contemporary history, and are thus of value to the historical student. The *Repentance of Nineveh* partakes of the character of the epic.

The principal edition of Ephraem's works was prepared and published at Rome under the patronage of the popes Clement XI., Clement XII., and Benedict XIV. It consists of three volumes of Greek texts and three volumes of Syriac texts, with a Latin translation. The first vol., published in 1732, was edited by Joseph Simon Assemani, the 4th and 5th (1737 and 1740) by Petrus Benedictus, the 6th (1743) by Benedictus (who died before it was completed) and Stephanus Evodius Assemani, and the 2d and 3d (1743 and 1746) by Joseph Simon Assemani. An earlier edition of 171 pieces in 3 folio volumes, edited by Gerhard Vossius, had appeared at Rome in 1589, 1593, and 1598; and Edward Thwaites had published a folio of Greek texts from Oxford MSS. in 1709. The following are the principal modern contributions to our knowledge of Ephraem and his works:—Spohn, *Collatio versionis syriacæ, quam Peschito vocant, cum fragmentis in comm. Ephraemi obviis*, 1785, 1794; Hahn, *Bardesanes Gnosticus*, 1819; Hahn, "Ueber den Gesang in der Syr. Kirche," in Staüdlin and Vater's *Kirchenhistorisches Archiv*, 1823; Hahn and Sieffert, *Chrestomathia Syriaca sive S. Ephraemi carmina selecta*, 1825; Tschirner, "De claris veteris ecclesiæ oratoribus," in his *Opuscula academica*, 1829; Pius Zingerle, *Ausgewählte Schriften des heil, Kirchenvaters Ephraem*, Innsbruck, 1830–1838; Lengerke, *De Ephraemi Syri arte hermeneutica*, Königsberg. 1831; J. B. Morris, *Select Works of St. Ephraem the Syrian, translated out of the original Syriac*, 1847; Angelo Paggi and Fausto Lasinio, *Inni funebri di S. Efrem Siro*, Florence, 1851; Burgess, *Select Metrical Hymns and Homilies of Ephraem Syrus*, 1853, and *The Repentance of Nineveh*, 1853; Alsleben, *Das Leben des H. Ephräm*, Berlin, 1853; Rödiger, "Ephräm Syrus," in Herzog's *Real-Encyclop. für Protest. Theol.*, 1855; R. P. Smith, *Catalogue of the Syrian Manuscripts in the Bodleian*, 1864; Overbeck, *Ephraemi Syri aliorumque opera selecta* (Syrian text), Oxford, 1865; Bickell, *S. Ephraemi Syri Carmina Nisibena* (Latin transl.), Leipsic, 1866; Wright, *Catalogue of the Syriac Manuscripts in the British Museum*, part ii. pp. 406–416; Benin, *Tradition of the Syriac Church*, 1871.

EPHRAIM, the younger son of Joseph, who received the precedence over the elder (Manasseh) by the blessing of Jacob, on the occasion when he adopted both into the number of his sons in place of Joseph their father. Both, accordingly, were the founders of tribes which bore their names, the intention of Jacob being that Joseph should by this means have double the honor accorded to his brethren. At the exodus from Egypt, the tribe of Ephraim, of which he was the founder, numbered 40,500, while that of Manasseh numbered only 32,200 (Numb. i. 32–35), but in their wanderings the number of the former was diminished by 8000. Their possessions in the very centre of Palestine included most of what was afterwards called Samaria. The proud and ambitious character of the tribe is indicated in their demands as narrated in Josh. xvii. 14, Judges viii. 1–3, xii. 1, and they were long jealous of the regal honors of Judah; but after the dismemberment of the tribes, their rivalry was merged in that subsisting between the two kingdoms.

EPICHARMUS (540–450 B.C.), a celebrated poet of the old comedy, was born in the island of Cos, where his father Elothales was a physician, of the race of the Asclepiads. According to Diogenes Laertius, he was brought to Megara, in Sicily, when only three months old; but it is more probable that he migrated thither, as Suidas asserts of his own accord at a later period. After the destruction of Megara he removed to Syracuse, where at the court of Hiero he spent the remainder of his days, dying, it is said, at ninety years of age. From his protracted residence in the island he is generally known in antiquity as a Sicilian (Hor. *Ep.* ii. 1. 58). Epicharmus studied philosophy, it is said, under Pythagoras, for it is now generally admitted that Epicharmus the Pythagorean and Epicharmus the father of the old comedy are identical. It was only after his residence in Megara, a colony from the Isthmian Megara, which disputed with Athens the invention of comedy, that he turned his attention to that branch of dramatic literature. His principal merit in this department seems to have consisted in the exclusion of that vulgar buffoonery which disgraced all previous comedies, and in the introduction of a regular plot in which the *comus*, or band of revellers, sustained the dialogue, with which maxims drawn from the Pythagorean ethics were liberally interspersed.

> "The subjects of the plays of Epicharmus," says Müller (*Dorians*, iv. 7, 2), "were mostly mythological, *i.e.*, parodies or travesties of mythology, nearly in the style of the satirical drama of Athens. Thus in the comedy of *Busiris* Hercules was represented in the most ludicrous light as a voracious glutton; and he was again exhibited in the same character (with a mixture perhaps of satirical remarks on the luxury of the times) in *The Marriage of Hebe*, in which an astonishing number of dishes was mentioned. He also, like Aristophanes, handled political subjects, and invented comic characters like the later Athenian poets. The piece called *The Plunderings*, which described the devastation of Sicily in his time, had a political meaning; and this was perhaps also the case with *The Islands*; at least it was mentioned in this play that Hieron had prevented Anaxilas from destroying Locri."

Of his comedies, which are generally written in trochaic tetrameters, thirty-five titles and a few fragments are still extant. The excellence of his dramatic style is proved by the high estimation in which he is held by Plato (*Theæt.* p. 152, e).

EPICTETUS (the word means "acquired," but no other name has been handed down for him) was, according to the received account, born at Hierapolis, a town in the southwest quarter of Phrygia. His life extends between a date slightly anterior and a date slightly posterior to the second half of the 1st century A.D. While young, he was one of the slaves of Epaphroditus, a freedman and courtier of the emperor Nero; and while in that position, he managed to attend the lectures of Musonius Rufus, an important and esteemed teacher of the Stoical system during the reigns of Nero and Vespasian. Epictetus was lame—whether from birth or in consequence of an accident or of his owner's cruelty is unknown; he was also of weakly health. That he was a free man in the later part of his life is evident, but the means by which his liberty was obtained are unrecorded. In the days of Domitian he was one of the recognized votaries and perhaps professors of philosophy; and in the year 90, when that emperor, irritated by the support and encouragement which the opposition to his tyranny found amongst the adherents of Stoicism, issued an edict to all philosophers to quit Rome, Epictetus was amongst those who withdrew into the provinces. For the rest of his life he settled at Nicopolis, a town of southern Epirus, not far from the scene of the battle of Actium. There for several years he lived, and taught by close, earnest, personal address and conversation. According to some authorities he lived into the time of Hadrian; he himself mentions the coinage of the emperor Trajan. His contemporaries and the next generation held his character and teaching in high honor. According to Lucian, the earthenware lamp which had belonged to the sage was bought by an enthusiastic relic-hunter for 3000 drachmas. He was never married. He wrote nothing; but much of his teaching was taken down with affectionate care by his pupil Flavius Arrianus, the historian of Alexander the Great, and is preserved in two treatises, of the larger of which, called the *Discourses of Epictetus* (’Επικτήτου Διατριβαί), four books are still extant. The other treatise is a shorter and has been a more popular work, the *Manual* or ’Εγχειρίδιον. It contains in an aphoristic form the main doctrines of the longer work. There exists a tolerably extensive commentary on the *Manual* by Simplicius.

The philosophy of Epictetus is stamped with an intensely practical character, and exhibits a high idealistic type of morality. He is an earnest, sometimes stern and sometimes pathetic preacher of righteousness, who despises the mere graces of a literary and rhetorical lecturer and the subtleties of an abstruse logic. He has no patience with mere antiquarian study of the Stoical writers. The problem of how life is to be carried out well is the one question which throws all other inquiries into the shade. "When you enter the school of the philosopher, ye enter the room of a surgeon; and as ye are not whole when ye come in, ye cannot leave it with a smile, but with pain." True education lies in learning to wish things to be as they actually are; it lies in learning to distinguish what is our own from what does not belong to us. But there is only one thing which is fully our own,—that is, our will or purpose. God, acting as a good king and a true father, has given us a will which cannot be restrained, compelled, or thwarted; he has put it wholly in our own power, so that even he himself has no power to check or control it. Nothing external, neither death nor exile nor pain nor any such thing, is ever the cause of our acting or not acting; the sole true cause lies in our opinions and judgments. Nothing can ever force us to act against our will; if we are conquered, it is because we have willed to be conquered. And thus, although we are not responsible for the ideas that present themselves to our consciousness, we are absolutely and without any modification responsible for the way in which we use them. Nothing is ours besides our will. And the divine law which bids us keep fast what is our own forbids us to make any claim to what is not ours; and while enjoining us to make use of whatever is given to us, it bids us not to long after what has not been given. "Two maxims," he says, "we must ever bear in mind,—that apart from the will there is nothing either good or bad, and that we must not try to anticipate or direct events, but merely accept them with intelligence." We must, in short, resign ourselves to whatever fate and fortune bring to us, believing, as the first article of our creed, that there is a god, whose thought directs the universe, and that not merely in our acts, but even in our thoughts and plans, we cannot escape his eye. In the world, according to Epictetus, the true position of man is that of member of a great system, which comprehends God and men. Each human being is thus a citizen of two cities. He is in the first instance a citizen of his own nation or commonwealth in a corner of the world; but he is also a member of the great city of gods and men, whereof the city political is only a copy in miniature. All men are the sons of God, and kindred in nature with the divinity. For man though a member in the system of the world is more than a merely subservient or instrumental part; he has also within him a principle which can guide and understand the movement of all the members; he can enter into the method of divine administration, and thus can learn—and it is the acme of his learning—the will of God, which is the will of nature. Man, said the Stoic, is a rational animal; and in virtue of that rationality he is neither less nor worse than the gods, for the magnitude of reason is estimated not by length nor by height, but by its judgments. Each man has within him a guardian spirit, a god within him, who never sleeps; so that even in darkness and solitude we are never alone, because God is within, and our guardian spirit. The body which accompanies us is not strictly speaking ours; it is a poor dead thing, which belongs to the things outside us. But by reason we are the masters of those ideas and appearances which present themselves from without; we can combine them, and systematize, and can set up in ourselves an order of ideas corresponding with the order of nature.

The natural instinct of animated life, to which man also is originally subject, is self-preservation and self-interest. But men are so ordered and constituted that the individual cannot secure his own interests unless he contribute to the common welfare. We are bound up by the law of nature with the whole fabric of the world. The aim of the philosopher therefore is to reach the position of a mind which embraces the whole world in its view,—to grow into the mind of God and to make the will of nature our own. Such a sage agrees in his thought with God; he no longer blames either God or man; he fails of nothing which he purposes and falls in with no misfortune unprepared; he indulges neither in anger nor envy nor jealousy; he is leaving manhood for godhead, and in his dead body his thoughts are concerned about his fellowship with God.

The historical models to which Epictetus reverts are Diogenes and Socrates. But he frequently describes an ideal character of a missionary sage, the perfect Stoic—or, as he calls him, the Cynic. "The Cynic," he says, "is a messenger sent from God to men to show them the error of their ways about good and evil, and how they seek good and evil where they cannot be found." This missionary has neither country nor home nor land nor slave; his bed is the ground; he is without wife or child; his only mansion is the earth and sky and a shabby cloak. It must be that he suffer stripes; and being beaten, he must love those who beat him as if he were a father or a brother. He must be perfectly unembarrassed in the service of God, not bound by the common ties of life, nor entangled by relationships, which if he transgresses he will lose the character of a man of honor, while if he upholds them he will cease to be the messenger, watchman, and herald of the gods. The perfect man thus described will not be angry with the wrong-doer; he will only pity his erring brother; for anger in such a case would only betray that he too thought the wrong-doer gained a substantial blessing by his wrongful act, instead of being, as he is, utterly ruined.

The best edition of the works of Epictetus is that by Schweighäuser in 6 vols. 8vo, 1799–1800. There are at least two English translations,—an old one by Elizabeth Carter, and a recent version by George Long. (W. W.)

EPICURUS, the founder of the Epicurean school of philosophy, was born in the end of 342 or the beginning of 341 B.C., seven years after the death of Plato. His father Neocles belonged to Gargettos, one of the small villages of Attica, but had settled in Samos, not later than 352, as one of the colonists sent out by the Athenian state after the conquest of the island by Timotheus in 366. In Samos, and also at Teos, Epicurus passed the early years of his life, probably assisting his father, who was a common schoolmaster, possibly, too, assisting his mother Archestrata in the practice of her witchcraft—if we may believe doubtful tales. At the age of 18 he went to Athens, where the Platonic school was flourishing under the lead of Xenocrates, and which Aristotle had recently quitted for Chalcis to avoid an indictment for impiety. This visit to Athens, however, was a short one, for in the next year (322) Antipater the Macedonian punished the Athenians for their incipient revolt by banishing about 12,000 of the poorer citizens to distant shores. It was in connection with this event that Epicurus joined his father, who was now located at Colophon. It seems possible that before this time he had listened to some lectures from Nausiphanes, a Democritean philosopher—perhaps also from others—but there is little reason to suppose that he was much better than a petty teacher like his father. The first awakening of the philosophic spirit was seen, it is said, when he asked his teacher, as they read together in Hesiod, how chaos was the first of all things, "What then preceded chaos?" Stimulated further by the perusal of some writings of Democritus, Epicurus began to formulate a doctrine of his own; and at Mitylene and Lampsacus, where he spent several years, he gradually gathered round him several disciples who adopted his views with enthusiasm. In 307, the year in which Demetrius Poliorcetes entered Athens and restored to it an at least nominal freedom, Epicurus returned to that city, which had now for a century and a half been the recognized head-quarters of Greek philosophy. Half his life was past; for the remaining thirty-six years he continued at Athens, with the exception of one or two visits to his friends in Ionia. The scene of his philosophic life and teaching was a garden which he bought at the cost of about £300 (80 minæ). There he passed his days as the loved and venerated head of a remarkable society, such as the ancient world had never seen. Amongst the number was Metrodorus, a bosom-friend of more energetic temperament than Epicurus; during their acquaintance, which lasted till the death of Metrodorus seven years before his friend, they only parted company for the space of six months. Timocrates, a brother of Metrodorus, was another member; so were Polyænus, a fair-minded and studious man, Hermarchus, a son of poor parents, who succeeded Epicurus as chief of the school, Leonteus, and others. Nor were women absent from the philosophic coterie. Themista, the wife of Leonteus, was a friend and correspondent of Epicurus; Idomeneus, another member, had married a sister of Metrodorus; and Metrodorus himself had as his consort Leontion, once a hetæra in Athens, but now the mother of a boy and girl, for whose welfare Epicurus made special provision in his will. That these were not the only ladies in the society is possible enough, and it is possible that the relations between the sexes—in this prototype of Rabelais's Abbey of Thelème—were not entirely what is termed Platonic. But there is on the other hand scarcely a doubt that the tales of licentiousness which ill-tempered opponents circulated regarding the society of the garden are groundless. The stories of the Stoics, who sought occasionally to refute the views of Epicurus by an appeal to his alleged antecedents and habits, were no doubt in the main, as Diogenes Laertius says, the stories of maniacs. The general charges against him which they endeavored to substantiate by forged letters need not count for much. Even when they tried to show that he was not a citizen with full rights, that he was a plagiarist of other men's wisdom, a correspondent of ladies whom the aristocracy of the period held of dubious rank, an ignoramus, and a scandalous and abusive critic of his opponents, they only exaggerated what, if true, was not so heinous as they wished it to appear. Against them trustworthy authorities testified to his general and remarkable considerateness; they pointed to the statues which the city had raised in his honor, and above all to the numbers of his friends, who were many enough to fill whole cities.

The mode of life in this community was plain. The general drink was water, and the food barley bread; half a pint of wine was held an ample allowance. "Send me," says Epicurus to a correspondent, "send me some Cythnian cheese, so that, should I choose, I may fare sumptuously." But though they lived together, Epicurus would not let his friends throw all their property into the common stock; that, he remarked, would imply distrust of their own and others' good resolutions. The company was held in unity by the siren-like charms of his personality, and by the free sociality which he inculcated and exemplified. Though he seems to have had a warm affection for his countrymen, it was as human beings brought into contact with him, and not as members of a political body, that he preferred to regard them. He never entered public life. His kindliness extended even to his slaves, one of whom, named Mouse, was a brother in philosophy.

Epicurus died of stone in 270 B.C. In a letter to a friend, he speaks of the pleasure afforded to him in his sufferings by the remembrance of happy hours spent in reasoning on the questions of philosophy. He passed away bidding his friends keep in mind the doctrines he had taught them. By his will he left his property, consisting of the garden, a house in Melite (the south-west quarter of Athens), and apparently some funds besides, to two trustees for behoof of his society, and for the special interest of some youthful members. The garden was set apart for the use of the school; the house became the house of Hermarchus and his fellow-philosophers during his life-time. The surplus proceeds of the property were further to be applied to maintain a yearly offering in commemoration of his departed father, mother, and brothers, to pay the expenses incurred in celebrating his own birth-day every year on the 7th Gamelion, and for a social gathering of the sect on the 20th of every month in honor of himself and Metrodorus. Besides similar tributes in honor of his brothers and Polyænus, he directed the trustees to be guardians of the son of Polyænus and the son of Metrodorus; whilst the daughter of the last-mentioned was to be married by the guardian to some member of the society who should be approved of by Hermarchus. His four slaves, three men and one woman, were left their freedom. His books passed on to Hermarchus.

Epicurus was a voluminous writer,—the author, it is said, of about 300 works. He had a style and vocabulary of his own. His chief aim in writing was plainness and intelligibility, but his want of order and of logical precision considerably thwarted the realization of his purpose. He pretended to have read little, and to be the original architect of his own system, and the claim was no doubt on the whole true. But he had read Democritus, and it is said Anaxagoras and Archelaus were also amongst his more favorite philosophical authors. His works, it is said, were full of repetition,—which was natural enough; and critics profess to have found in them some vulgarities of language and faults of style. But at any rate they were read and remembered, his pupils got them by heart, and to the last era of Epicureanism they continued in full authority. His chief work was a treatise on nature, in thirty-seven books, of which fragments from about nine books have been found in the rolls discovered at Herculaneum, along with considerable treatises by several of his followers, and most notably Philodemus. An epitome of his doctrine is contained in three letters preserved by Diogenes.

The Epicurean philosophy is traditionally divided into the three branches of logic, physics, and ethics. But it is only as a basis of facts and principles for his theory of life that logical and physical inquiries find a place at all. Epicurus himself had not apparently shared in any large or liberal culture, and his influence was certainly thrown on the side of those who depreciated purely scientific pursuits as one-sided and misleading. "Steer clear of all culture" was his advice to a young disciple. In this aversion to a purely or mainly intellectual training may be traced a recoil from the systematic metaphysics of Plato and Aristotle. With these writers the tendency was to sacrifice the moral to the intellectual—to subordinate the practical man to the philosopher. Ethics had been based upon logic and metaphysics; more had been done to explain the formation of a right judgment in matters of morality than to explain or promote right action. But every-day experience showed that no amount of merely intellectual study is preventive of immorality, and that the systematic knowledge of truth is one thing and right action is another. It seemed to many as well as to Epicurus that the philosophy of Plato and Aristotle led to an aristocracy of intellect, but not to a commonwealth of happiness and goodness. In this way a reaction set in against reasoning and speculation; people wanted to get back to common sense and the feelings of ordinary men. In the second place, Plato and Aristotle had constructed their moral theories on the assumption that a state or a city existed which both showed in the shape of its several institutions how the individual man was expected to behave, and threatened him with various penalties in case he attempted to find out a way of action for himself. They could accordingly give themselves the comparatively easy task of showing how the individual could learn to apprehend and embody in his own conduct the moral law which was exhibited in the institutions of society. But experience had in the time of Epicurus shown the temporary and artificial character of the civic form of social life. It was necessary therefore for Epicurus to go back to nature to find a more enduring and a wider foundation for ethical doctrine, and to decline the help that might be derived from a consideration of the existing form of political union. It was no less necessary to go back from words to realities, to give up reasonings and get at feelings, to test conceptions and arguments by a final reference to the only touchstone of truth—to sensation. There, and there only, one seems to find a common and a satisfactory ground, supposing always that all men's feelings give the same answer. Logic must go, but so also must the state, as a specially-privileged and eternal order of things, as anything more than a contrivance serving certain purposes of general utility.

To the Epicureans the elaborate logic of the Stoics was a superfluity. In place of logic we find canonic, the theory of the tests of truth and reality. The only ultimate canon of reality is sensation and feeling; whatever we feel, whatever we perceive by any sense, that we know on the most certain evidence we can have to be real, and in proportion as our feeling is clear, distinct, and vivid, in that proportion are we sure of the reality of its object. The truth of anything is measured by its vivid and effective presence in consciousness. But in what that vividness (ἐνάργεια) consists is a question which Epicurus does not raise, and which he would no doubt have deemed superfluous quibbling over a matter sufficiently settled by common sense. Besides our sensations, we learn truth and reality by our preconceptions or ideas (προλήψεις). These are the fainter images produced by repeated sensations, the "ideas" resulting from previous "impressions"—sensations at second-hand as it were, which are stored up in memory, and which a general name serves to recall. These bear witness to reality, not because we feel anything now, but because we felt it once; they are sensations registered in language, and again, if need be, translatable into immediate sensations or groups of sensation. Lastly, reality is vouched for by the imaginative apprehensions of the mind (φανταστικαὶ ἐπιβολαί), immediate feelings of which the mind is conscious as produced by some action of its own. This last canon, however, was of dubious validity. Epicureanism generally stopped by affirming that whatever we effectively feel in consciousness is real; in which sense they allow reality to the fancies of the insane, the dreams of a sleeper, and those feelings by which we imagine the existence of beings of perfect blessedness and endless life. And similarly, just because fear, hope, and remembrance add to the intensity of consciousness, can the Epicurean hold that bodily pain and pleasure is a less durable and important thing than pain and pleasure of mind. Whatever we feel to affect us does affect us, and is therefore real. Error can only arise because we mix up our opinions and suppositions with what we actually feel. The Epicurean canonic is a rejection of logic; it sticks fast to the one point that "sensation is sensation," and there is no more to be made of it. Sensation, it says, is unreasoning (ἄλογος); it must be accepted, and not criticised. Reasoning can only come in to put sensations together, and to point out how they severally contribute to human welfare; it does not make them, and cannot alter them.

In the Epicurean physics we have two parts,—a general metaphysic and psychology, and a special explanation of particular phenomena of nature. It is in this department that we find exemplified the method of the founder. That method consists in argument by analogy: we apply the process which we have learned in some familiar instance to explain and rationalize for our own satisfaction some obscure and distant process which we do not understand. It is an attempt to make the phenomena of nature intelligible to us by regarding them as instances on a grand scale of what we are already familiar with on a small. This is what Epicurus calls explaining what we do not see by what we do see. It supposes us to know and comprehend what we are familiar with, and assumes that to explain is to substitute a process with which we are at home for one which we cannot penetrate, but which, without contradicting any of the phenomena, may be conceived to take place in a similar way.

In physics Epicurus founded upon Democritus, and his chief object was to abolish the dualism between mind and matter which is so essential a point in the systems of Plato and Aristotle. All that exists, says Epicurus, is corporeal (τὸ πᾶν ἐστι σῶμα); the intangible is non-existent, or empty space. If a thing exists it must be felt, and to be felt it must exert resistance. But all things are not intangible which our senses are not subtle enough to detect. We must indeed accept our feelings; but we must also believe much which is not directly testified by sensation, if only it does not contravene our sensations and serves to explain phenomena. The fundamental postulates of Epicureanism are atoms and the void. We must believe, according to him, that space is infinite, and that there is an illimitable multitude of indestructible, indivisible, and absolutely compact atoms in perpetual motion in this illimitable space. These atoms, differing only in size, figure, and weight, are perpetually moving with equal velocities, but at a rate far surpassing our conceptions; as they move, they are for ever giving rise to new worlds; and these worlds are perpetually tending towards dissolution, and towards a fresh series of creations. This universe of ours is only one section out of the innumerable worlds in infinite space; other worlds may present systems very different from the arrangement of sun, moon, and stars, which we see in this. The soul of man is only a finer species of body, spread throughout the whole aggregation which we term his bodily frame. Like a warm breath, it pervades the human structure and works with it; nor could it act as it does in perception unless it were corporeal. The various processes of sense, notably vision, are explained on the principles of materialism. From the surfaces of all objects there are continually flowing thin filmy images exactly copying the solid body whence they originate; and these images by direct impact on the organism produce (we need not care to ask how) the phenomena of vision. Epicurus in this way explains vision by substituting for the apparent action of a body at a distance a direct contact of image and organ. But without following the explanation into the details in which it revels, it may be enough to say that the whole hypothesis is but an attempt to exclude the occult conception of action at a distance, and substitute a familiar phenomenon.

This tendential character of the Epicurean physics becomes more palpable when we look at his mode of rendering particular phenomena intelligible. His purpose is to eliminate all ideas by which the grander phenomena of nature are properly attributed to Divine interference. That there are gods Epicurus never dreams of denying; the feelings of human nature are too vivid which present to our mind's eye beings of perfect blessedness and unbroken tranquillity. But these gods have not on their shoulders the burden of upholding and governing the world. They are themselves the products of the order of nature,—a higher species than humanity, but not the rulers of man, neither the makers nor the upholders of the world. Man should worship them, but his worship is the reverence due to the ideals of perfect blessedness; it ought not to be inspired either by hope or by fear. To prevent all reference of the more potent phenomena of nature to divine action Epicurus rationalizes the processes of the cosmos. He imagines all possible plans or hypotheses, not actually contradicted by our experience of familiar events, which will represent in an intelligible way the processes of astronomy and meteorology. When two or more modes of accounting for a phenomena are equally admissible as not directly contradicted by known phenomena, it seems to Epicurus almost a return to the old mythological habit of mind when a savant asserts that the real cause is one and only one. Thus, after several hypothetical accounts of how thunder may be brought about, he adds, "Thunder may be explained in many other ways; only let us have no myths of divine action. To assign only a single cause for these phenomena, when the facts familiar to us suggest several, is insane, and is just the absurd conduct to be expected from people who dabble in the vanities of astronomy." We need not be too curious to inquire how these celestial phenomena actually do come about; we can learn how they might have been produced, and to go further is to trench on ground beyond the limits of human knowledge.

Thus, if Epicurus objects to the doctrine of mythology, he objects no less to the doctrine of an inevitable fate, a necessary order of things unchangeable and supreme over the human will. "Better were it," he says, "to accept all the legends of the gods than to make ourselves slaves to the fate of the natural philosophers." Fatalism, which was the doctrine of the Stoics, seemed to Epicurus no less deadly a foe of man's true welfare than popular superstition. Even in the movement of the atoms he introduces a sudden change of direction, which is supposed to render their aggregation easier, and to break the even law of destiny. So, in the sphere of human action, Epicurus would allow of no absolutely controlling necessity. There is much in our circumstances that springs from mere chance, but it does not over-master man. With a latent optimism, Epicurus asserts that, though there are evils in the world, still their domination is brief at the height, and there are many consoling circumstances; while, on the other hand, it is easy to attain the maximum of pleasure. The sphere of man's action is marked by self-determination; he need own no master. "Better," he says, "is the misfortune of the man who has planned his way wisely, than the prosperity of him who has devised foolishly." In fact, it is only when we assume for man this independence of the gods and of fatality that the Epicurean theory of life becomes possible. It assumes that man can, like the gods, withdraw himself out of reach of all external influences, and thus, as a sage, "live like a god among men, seeing that the man is in no wise like a mortal creature who lives in undying blessedness." And this present life is the only one. With one consent Epicureanism preaches that the death of the body is the end of everything for man, and hence the other world has lost all its terrors as well as all its hopes.

The attitude of Epicurus in this whole matter is antagonistic to science. The idea of a systematic enchainment of phenomena, in which each is conditioned by every other, and none can be taken in isolation and explained apart from the rest, was foreign to his mind. When that idea is embraced, then obviously the whole group of phenomena must be taken into account in determining whether any hypothesis will serve to explain a detached section. But so little was the scientific conception of the solar system familiar to Epicurus that he could reproach the astronomers, because their account of an eclipse represented things otherwise than as they appear to the senses, and could declare that the sun and stars were just as large as they seemed to us.

The moral philosophy of Epicurus is the heir of the Cyrenaic doctrine that pleasure is the good thing in life. Neither sect, it may be added, advocated sensuality pure and unfeigned,—the Epicurean least of all. By pleasure Epicurus meant both more and less than the Cyrenaics. To the Cyrenaics pleasure was of moments; to Epicurus it extended as a habit of mind through life. To the Cyrenaics pleasure was something active and positive; to Epicurus it was rather negative,—tranquillity more than vigorous enjoyment. The test of true pleasure, according to Epicurus, is the removal and absorption of all that gives pain; it implies freedom from pain of body and from trouble of mind. The happiness of the Epicurean was, it might almost seem, a grave and solemn pleasure—a quiet unobtrusive ease of heart, but not exuberance and excitement. The Cyrenaic was a buoyant and self-reliant nature, who lived in the light of a grander day in Greece; and he plucked pleasures carelessly and lightly from the trees in the garden of life as he passed through on his journey, without anxiety for the future, or regret for the past. The sage of Epicureanism is a rational and reflective seeker for happiness, who balances the claims of each pleasure against the evils that may possibly ensue, and treads the path of enjoyment cautiously, as befits "a sober reason which inquires diligently into the grounds of acting or refraining from action, and which banishes those prejudices from which spring the chief perturbation of the soul." Prudential wisdom is therefore the only means by which a truly happy life may be attained; it is thus the chief excellence, and the foundation of all the virtues. It is, in fact, says Epicurus,—in language which contrasts strongly with that of Aristotle on the same topic—"a more precious power than philosophy." Pleasure still remains the end; but the natural instinct which prompts to take any opportunity of enjoyment is held in check by the reflection on consequences. The reason or intellect is introduced to measure pleasures—to balance possible pleasures and pains—to construct a scheme in which pleasures are the materials of a happy life. Feeling, which Epicurus declared to be the means of determining what is good, is subordinated to a reason which adjudicates between competing pleasures with a view of securing tranquillity of mind and body. But to do so is no easy task; it makes the search for pleasure almost an impossibility. Epicurus is more clearly in the right when he expatiates on the necessary interdependence of virtue and happiness: "We cannot live pleasantly without living wisely and nobly and righteously." Virtue is at least a means of happiness, though apart from that it is no good in itself, any more than mere sensual enjoyments, which are good only because they may sometimes serve to secure health of body and tranquillity of mind.

The theory of Epicurus has no direct utilitarian tone. Its aim is the happiness of the individual. But its selfishness is tempered by friendship. The only duties which Epicurus recognizes are those which have been freely accepted on rational grounds, not from the compulsion of appetite or of circumstances. Thus the ideal of Epicurean society was the friendly circle. The family and the state imposed, as he thought, obligations which lessened the independence of man, and subjected him to externals. "The sage," he says, "will not marry and beget children, nor will he take part in state affairs. Though holding but little by many conventionalities, he will not assume a cynical or stoical indifference to others; he will not form hard and fast judgments; he will not believe all sinners to be equally depraved, nor all sages equally wise." Friendship—like the state in its first origin—is based upon utility; but in it our relations are less forced; and though its motive be utility, still one must begin the good work of well-doing, even as the husbandman first bestows his labor and wealth upon the soil from which he hopes one day to receive fruit in return.

Even in the lifetime of Epicurus we hear of the vast numbers of his friends, not merely in Greece, but in Asia and Egypt. The crowds of Epicureans were a standing enigma to the adherents of less popular sects. Cicero pondered over the fact; Arcesilaus explained the secession to the Epicurean camp, compared with the fact that no Epicurean was ever known to have abandoned his school, by saying that, though it was possible for a man to be turned into a eunuch, no eunuch could ever become a man. But the phenomenon was not obscure. The doctrine has many truths, and attracts most natures in some of its parts, especially in an age of religious scepticism. Besides, Epicureanism resembled a church more than a philosophical school. It was not very systematic, but very dogmatic. To develop it would have been to destroy it, for its great point was to hold fast to certain principles of common sense. The dogmas of Epicurus became to his followers a creed embodying the truths on which salvation depended; and they passed on from one generation to another with scarcely a change or addition.

The immediate disciples of Epicurus have been already mentioned, with the exception of Colotes. In the 2d century B.C. Apollodorus and Zeno of Sidon taught at Athens. About 150 B.C. Epicureanism established itself at Rome. Beginning with C. Amafinius, we find the names of Phædrus and Philodemus as distinguished Epicureans in the time of Cicero. But the greatest of its Roman names was Lucretius, whose *De Rerum Natura* embodies the main teaching of Epicurus with great exactness, and with a beauty which the subject seemed scarcely to allow. Lucretius is a proof, if any were needed, that Epicureanism is compatible with nobility of soul. In the 1st century of the Christian era, the nature of the time, with its active political struggles, naturally called Stoicism more into the foreground; yet Seneca, though nominally a Stoic, draws nearly all his suavity and much of his paternal wisdom from the writings of Epicurus. The position of Epicureanism as a recognized school in the 2d century is best seen in the fact that it was one of the four schools (the others were the Stoic, Platonist, and Peripatetic) which were placed on a footing of equal endowment when Marcus Aurelius founded chairs of philosophy at Athens. The evidence of Diogenes proves that it still subsisted as a school a century later, but its spirit lasted longer than its formal organization as a school. A great deal of the best of the Renaissance was founded on Epicureanism.

The chief ancient account of Epicurus is to be found in the 10th book of Diogenes Laertius, in Lucretius, and in several treatises of Cicero and Plutarch. Gassendi, in his *De Vita, Moribus, et Doctrina Epicuri* (Lyons, 1647), and his *Syntagma Philosophiæ Epicuri*, has systematized the doctrine. The *Volumina Herculanensia*, the first series of which in 11 vols. fol. was published between 1793 and 1855 at Naples, and the second series of which, begun in 1861, is still going on, contain numerous fragments of treatises by Epicurus, and several members of his school. The fragments of the second and eleventh books have been edited after Rosini, by Orelli. T. Gompertz, in his *Herkulanische Studien*, and in recent contributions to the Vienna Academy (*Monatsberichte*), has tried to evolve from the fragments more approximation to modern empiricism than they seem to contain. Cf. also G. Trezza, *Epicuro e l'Epicureismo*, Florence, 1877, and Zeller's *Philosophy of the Stoics, Epicureans, and Sceptics*, translated by Reichel. (W. W.)

EPIDAMNUS, an ancient city of Illyricum, was founded by a joint colony of Corcyreans and Corinthians towards the close of the 7th century B.C., and from its admirable position and the fertility of the surrounding country soon rose into very considerable importance. The dissolution of its original oligarchical government by the increasing power of the democrats was one of the causes that contributed to bring about the Peloponnesian war, in the course of which it soon sank into a secondary position, and ultimately disappeared altogether from the contest. In 312 B.C. it was seized by Glaucias, king of the Illyrians; and about the close of the war it was attacked by pirates, who were twice driven back—on the second occasion by the timely arrival of assistance from Rome. As the name Epidamnus sounded to Roman ears like an evil omen, the alternative name of Dyrrachium, which it probably received from the rugged nature of the adjoining sea-coast, came into general use. In the later history of the Roman republic Dyrrachium became famous as the place where Pompey made the last successful resistance to the rising fortunes of Cæsar, who was at length compelled to transfer the theatre of war to another quarter. At the end of the struggle between Antony and Augustus it fell into the hands of the latter, and was by him made over to a colony of his veteran troops. Under the Lower Empire it became the capital of Epirus Nova, and attained remarkable prosperity. In 481 it was besieged by Theodoric, the king of the East Goths; and in the 10th and 11th centuries it frequently had to defend itself against the Bulgarians. The emperor Ducas bestowed it as a duchy on Bryennius. In 1082 it was stormed by the Norman Guiscard, who in the previous year had defeated the Greeks under their emperor Alexius; and in 1185 it fell into the hands of King William of Sicily. Surrendered to Venice on the division of the Byzantine kingdom, it afterwards broke loose from the republic. In 1273 it was laid in ruins by an earthquake; but it soon recovered from the disaster, and in the beginning of the next century it appears as an independent duchy under Philip of Otranto. The Turks obtained possession in 1503. See DURAZZO, vol. vii. p. 478.

EPIDAURUS, a maritime city of ancient Greece, on the eastern coast of Argolis, sometimes distinguished as ἡ ἱερὰ Ἐπίδαυρος, or Epidaurus the Holy. It stood on a small rocky peninsula with a natural harbor on the northern side and an open but serviceable bay on the southern; and from this position acquired the epithet of δίστομος, or the two-mouthed. Its narrow but fertile territory consisted of a plain shut in on all sides except towards the sea by considerable elevations, among which the most remarkable were Mount Arachnæon (the modern Arna) and Titthion. The conterminous states were Corinth, Argos, Trœzen, and Hermione. Its proximity to Athens and the islands of the Saronic gulf, the commercial advantages of its position, and the fame of its temple of Æsculapius combined to make Epidaurus a place of no small importance. Its origin was ascribed to a Carian colony, whose memory was possibly preserved in Epicarus, the earlier name of the city; it was afterwards occupied by Ionians, and appears to have incorporated a body of Phlegyans from Thessaly. The Ionians in turn succumbed to the Dorians of Argos, who, according to the legend, were led by Deiphontes; and from that time the city continued to preserve its Dorian character. It not only colonized the neighboring islands, and founded the city of Ægina, by which it was ultimately outstripped in wealth and power, but also took part with the people of Argos and Trœzen in their settlements in the south of Asia Minor. The monarchical government introduced by Deiphontes gave way to an oligarchy, and the oligarchy degenerated into a despotism. When Procles the tyrant was carried captive by Periander of Corinth, the oligarchy was restored; and the people of Epidaurus continued ever afterwards close allies of the Spartan power. The governing body consisted of 180 members, chosen from certain influential families, and the executive was entrusted to a select committee of *artynæ*. The rural population, who had no share in the affairs of the city, were called κονίποδες, or dusty-feet. Among the objects of interest described by Pausanias as extant in Epidaurus are the image of Athena Cissæa in the Acropolis, the temple of Dionysus and Artemis, a shrine of Aphrodite, statues of Æsculapius and his wife Epione, and a temple of Hera. The site of the last is identified with the chapel of St. Nicolas; a few portions of the outer walls of the city can be traced; and the name Epidaurus is still preserved by the little village of Nea-Epidavros or Pidhavro. About five miles from the city stood a famous temple of Æsculapius, in a beautiful valley in the heart of the mountains; and in its neighborhood were buildings for the accommodation and recreation of the patients who flocked thither in quest of health; so that the spot was practically a prototype of our modern watering-places. The ἄλσος, or inclosure, was kept sacred from birth and death; but rooms were provided in connection with the temple for the "incubation" of ordinary sick folk. A festival in honor of Æsculapius was celebrated every fourth year, nine days after the Isthmian games at Corinth. The institution acquired great wealth from the offerings of those who received or expected benefit from the god or his priests; and though it was plundered both by Sulla and the Cilician pirates, it is evident from the character of the ruins that it recovered its prosperity in the later Roman period. Antoninus Pius is especially commemorated on account of the many buildings he restored or erected for the service of the sanctuary. The site of the temple can still be recognized; the great theatre of Polyclitus is the most perfect ruin of its kind in southern Greece; and the ground plan of the same architect's "Tholos" of white marble is still to be seen.

See *Expédition de la Morée*, ii.; Curtius, *Peloponnesus*, ii.; *Transactions of Roy. Soc. of Lit.*, 2d series, vol. ii.; Weclawski, *De rebus Epidauriorum*, Posen, 1854.

EPIDAURUS, a city of the Peloponnesus on the east coast of Laconia, distinguished by the epithet of Limera, which is explained as either the Well-havened or the Hungry. It was founded by the people of Epidaurus the Holy, and its principal temples were those of Æsculapius and Aphrodite. It was abandoned during the Middle Ages; and its inhabitants took possession of the promontory of Minoa, turned it into an island, and built and fortified thereon the city of Monembasia (*i.e.*, of the one entrance), which became the most flourishing of all the towns in the Morea, and gave its name, as corrupted by the people of Western Europe, to the well-known Malmsey or Malvasia wine. The ruins of Epidaurus are to be seen at the place now called Old Monemvasia.

A third Epidaurus was situated in Illyricum, on the site of the present Vecchia Ragusa; but it is not mentioned till the time of the civil wars of Pompey and Cæsar, and has no special interest.

EPIGONI, a Greek word denoting simply *sons* or *descendants*, but applied more particularly to certain mythical chiefs who fought against Thebes. After the terrible catastrophe which brought about the death of Iokaste (Jocasta) and the blinding of Œdipus, Eteocles and Polynices, the sons of this ill-fated pair, incurred the wrath of their father, whom they cast out from his home to fight with poverty as well as blindness. The curse of the aged king worked in the dissensions of the two brothers; and Polynices, driven into exile, made his way to Argos, where Adrastus took up his cause. The result was the enterprise which Attic tradition spoke of as the expedition of the Seven Argive Chiefs against Thebes, but which, according to the poets of the Thebais, involved as large a gathering as that of the chieftains who assembled to hunt the Calydonian boar or to recover the Golden Fleece. This strife was fatal, as the prophecies of Melampous had declared it must be, to all the chiefs engaged in it with the exception of Adrastus, the seer Amphiaraus being saved from death only by the opening of the earth, which received him alive with his chariot into her bosom. Thus ended the first assault of the Argives against Thebes, an assault which answers closely to the first ineffectual attempts of the Heraclids to recover their paternal inheritance in the Peloponnesus. As in the other tradition, with which the Theban story was parallel, it was followed by a second attack in the struggle known as the war of the Epigoni, or the children of the discomfited chiefs of the former expedition. The doom of Thebes was now come, and the Epigoni appeared, like the Heraclids, when their period of enforced idleness is at an end. The Thebans are utterly routed by the Argives under Alcmæon, the son of Amphiaraus; and the prophet Tiresias declares that there is no longer any hope, as the gods have abandoned them. The city is therefore surrendered, and Thersandrus, the son of Polynices, is seated on the throne of Cadmus. How far the poets of the Thebais, which treated of these wars, may have imparted to their subject the charm of our *Iliad* or *Odyssey*, the scanty fragments of the poem, which alone we possess, make it impossible to say; but there can be no doubt that there were incidents in the struggle which might be so treated as to win for it a title to the high praise bestowed upon it by Pausanias (ix. 9, 3).

EPIGRAMS. Nothing perhaps could be more hopeless than an attempt to discover or devise a definition wide enough to include the vast multitude of little poems which at one time or other have been honored with the title of epigram, and precise enough to exclude all others. Without taking account of its evident misapplications, we find that the name has been given—first, in strict accordance with its Greek etymology from ἐπιγράφειν, to inscribe, to any actual inscription on monument, statue, or building; secondly, to verses never intended for such a purpose, but assuming for artistic reasons the epigraphical form; thirdly, to verses expressing with something of the terseness of an inscription a striking or beautiful thought; and fourthly, by unwarrantable restriction, to a little poem ending in a "point," especially of the satirical kind. The last of these has obtained considerable popularity from the well-known lines—

"The qualities rare in a bee that we meet
In an epigram never should fail;
The body should always be little and sweet,
And a sting should be left in its tail"—

which represent the older Latin of some unknown writer—

"Omne epigramma sit instar apis: sit aculeus illi;
Sint sua mella; sit et corporis exigui."

Attempts not a few of a more elaborate kind have been made to state the essential element of the epigram, and to classify existing specimens; but, as every lover of epigrams must feel, most of them have been attended with very partial success. Scaliger, in the third book of his *Poetics*, gives a fivefold division, which displays a certain ingenuity in the nomenclature, but is very superficial: the first class takes its name from *mel*, or honey, and consists of adulatory specimens; the second from *fel*, or gall; the third from *acetum*, or vinegar; and the fourth from *sal*, or salt; while the fifth is styled the condensed, or multiplex. This classification is adopted by Nicolaus Mercerius in his *De conscribendo epigrammate*, Paris, 1653; but he supplemented it by another of much more scientific value, based on the figures of the ancient rhetoricians. Lessing, in the preface to his own epigrams, gives an interesting treatment of the theory, his principal doctrine being practically the same as that of several of his less eminent predecessors, that there ought to be two parts more or less clearly distinguished—the first awakening the reader's attention in the same way as an actual monument might do, and the other satisfying his curiosity in some unexpected manner. An attempt was made by Herder to increase the comprehensiveness and precision of the theory; but as he himself confesses, his classification is rather vague—the expository, the paradigmatic, the pictorial, the impassioned, the artfully turned, the illusory, and the swift. After all, if the arrangement according to authorship be rejected, the simplest and most satisfactory is according to subjects. The epigram is one of the most catholic of literary forms, and lends itself to the expressions of almost any feeling or thought. It may be an elegy, a satire, or a love-poem in miniature, an embodiment of the wisdom of the ages, a bon-mot set off with a couple of rhymes.

"I cannot tell thee who lies buried here:
No man that knew him followed by his bier;
The winds and waves conveyed him to this shore,
Then ask the winds and waves to tell thee more."
ANONYMOUS.

"Wherefore should I vainly try
To teach thee what my love will be
In after years, when thou and I
Have both grown old in company,
If words are vain to tell thee how,
Mary, I do love thee now?"
ANONYMOUS.

"O Bruscus, cease our aching ears to vex
With thy loud railing at the softer sex;
No accusation worse than this could be,
That once a woman did give birth to thee."
ACILIUS.

"Treason doth never prosper. What's the reason?
For if it prospers none dare call it treason."
HARRINGTON.

"Ward has no heart, they say, but I deny it;
He has a heart, and gets his speeches by it."
ROGERS.

From its very brevity there is no small danger of the epigram passing into childish triviality; the paltriest pun, a senseless anagram, is considered stuff enough and to spare. For proof of this there is unfortunately no need to look far; but perhaps the reader could not find a better collection ready to his hand than the second twenty-five of the *Epigrammatum Centuriæ* of Samuel Erichius; by the time he reaches No. 11 of the 47th century, he will be quite ready to grant the appropriateness of the identity maintained between the German *Seele*, or soul, and the German *Esel*, or ass.

Of the epigram as cultivated by the Greeks a detailed account has been given in the article on the ANTHOLOGIES, those wonderful collections which bid fair to remain the richest of their kind. The delicacy and simplicity of so much of what has been preserved is perhaps their most striking feature; and one cannot but be surprised at the number of poets proved capable of such work. In Latin literature, on the other hand, the epigrammatists are comparatively few, and though several of them, as Catullus and Martial, are men of high literary genius, too much of what they have left behind is vitiated by brutality and obscenity. On the subsequent history of the epigram, indeed, Martial has exercised an influence as baneful as it is extensive, and he may fairly be counted the far-off progenitor of a host of scurrilous verses which he himself would almost have blushed to write. Nearly all the learned Latinists of the 16th and 17th centuries may claim admittance into the list of epigrammatists,—Bembo and Scaliger, Buchanan and More, Stroza and Sannazarius. Melanchthon, who succeeded in combining so much of Pagan culture with his Reformation Christianity, has left us some graceful specimens, but his editor, Joannes Major Jaochimus, has so little idea of what an epigram is, that he includes in his collection some translations from the Psalms. John Owen, or, as he Latinized his name, Johannes Audoenus, a Cambro-Briton, attained quite an unusual celebrity in this department, and is regularly distinguished as Owen the Epigrammatist. The tradition of the Latin epigram has been kept alive in England by such men as Porson, Vincent Bourne, and Walter Savage Landor; and at one at least of our universities there is an annual prize for the best original specimen. Happily there is now little danger of any too personal epigrammatist suffering the fate of Niccolo Franco, who paid the forfeit of his life for having launched his venomous Latin against Pius V., though he may still incur the milder penalty of having his name inserted in the *Index Expurgatorius*, and find, like John Owen, that he consequently has lost an inheritance.

In English literature proper there is no writer like Martial in Latin or Logau in German, whose fame is entirely due to his epigrams; but several even of those whose names can perish never have not disdained this diminutive form. The designation epigram, however, is used by our earlier writers with excessive laxity, and given or withheld without apparent reason. The collection which bears the title of *One and thirtye Epigrammes, wherein are bryefly touched so many abuses that may and ought to be put away: Compiled and Imprinted by Robert Crowley*, 1550, is of almost no literary value, consisting of rugged and in many cases vulgar and pointless attempts at satire. Those of Henry Parrot, published in 1613 as *Laquei ridiculosi, or Springes to catch Woodcocks*, are only not quite as worthless, though, as far as the mere form goes, they better deserve the name they assume; for, according to the author's poetical simile—

> "We make our epigrammes as men taste cheese,
> Which hath his relish in the last farewell."

John Weever's collection (1599) is of interest mainly because of its allusion to Shakespeare. Ben Jonson furnishes a number of noble examples in his *Underwoods;* and one or two of Spenser's little poems and a great many of Herrick's are properly classed as epigrams. Turberville is just as graceful in this department as he is in everything else; but he has left one at least which is not without value—

> "A miser's mind thou hast,
> Thou hast a prince's pelf,
> Which makes thee wealthy to thine heir,
> A beggar to thyself."

A few quaint specimens may be culled from the pages of Thomas Fuller; but most of the fifty-nine epigrams recently published by Mr. Grosart are poor affairs at the best. Cowley, Waller, Dryden, Prior, Parnell, Swift, Addison, Johnson, Goldsmith, and Young have all been at times successful in their epigrammatical attempts; but perhaps none of them has proved himself so much "to the manner born" as Pope, whose name indeed is almost identified with the epigrammatical spirit in our literature. Few of our modern poets have followed in his footsteps, and though nearly all might plead guilty to an epigram or two, there is no one who has a distinct reputation as an epigrammatist. Such a reputation might certainly have been Landor's, had he not chosen to write the best of his minor poems in Latin, and thus made his readers nearly as select as his language.

The French are undoubtedly the most successful cultivators of the "salt" and the "vinegar" epigram; and from the time of Marot downwards many of their principal authors have earned no small celebrity in this department. It is enough to mention the names of J. B. Rousseau, Lebrun, Voltaire, Marmontel, Piron, and Chénier. In spite of Rapin's dictum that a man ought to be content if he succeeded in writing one really good epigram, those of Lebrun alone number upwards of 600, and a very fair proportion of them would doubtless pass muster even with Rapin himself. If Piron was never anything better, "pas même un académicien," he appears at least in Grimm's phrase to have been "une machine à saillies, à epigrammes, et à bon-mots." Perhaps more than anywhere else the epigram has been recognized in France as a regular weapon in literary and political contests, and it might not be altogether a hopeless task to compile an epigrammatical history from the Revolution to the present time.

While any fair collection of German epigrams will furnish examples that for keenness of wit would be quite in place in a French anthology, the Teutonic tendency to the moral and didactic has given rise to a class but sparingly represented in French. The very name of *Sinngedichte* bears witness to this peculiarity, which is exemplified equally by the rude *priameln*, or *præameln*, of the 13th and 14th centuries and the polished lines of Goethe and Schiller. Logau published his *Deutsche Sinngetichte Drey Tausend* in 1654, and Wernicke no fewer than six volumes of *Ueberschriften oder Epigrammata* in 1697; Kästner's *Sinnegedichte* appeared in 1782, and Haug and Weissen's *Epigrammatische Anthologie* in 1804. Kleist, Opitz, Gleim, Hagedorn, Klopstock, and A. W. Schlegel all possess some reputation as epigrammatists; Lessing is *facile princeps* in the satirical style; and Herder has the honor of having enriched his language with much of what is best from Oriental and classical sources.

It is often by no means easy to trace the history of even a single epigram, and the investigator soon learns to be cautious of congratulating himself on the attainment of a genuine original. The same point, refurbished and fitted anew to its tiny shaft, has been shot again and again by laughing cupids or fierce-eyed furies in many a frolic and many a fray. During the period when the epigram was the favorite form in Germany, Gervinus tells us how the works, not only of the Greek and Roman writers, but of Neo-Latinists, Spaniards, Dutchmen, Frenchmen, Englishmen, and Poles were ransacked and plundered; and the same process of pillage has gone on in a more or less modified degree in other times and countries. Very noticeable often are the modifications of tone and expression occasioned by national and individual characteristics: the simplicity of the prototype may become common-place in the imitation, the sublime be distorted into the grotesque, the pathetic degenerate into the absurdly sentimental; or on the other hand, an unpromising *motif* may be happily developed into unexpected beauty. A good illustration of the variety with which the same epigram may be translated and travestied is afforded by a little volume published in Edinburgh in 1808, under the title of *Lucubrations on the Epigram*—

> Ει μὲν ἦν μαθεῖν ἃ δεῖ παθειν,
> Καὶ μὴ παθεῖν, καλὸν ἦν τὸ μαθεῖν·
> Ἐι δὲ δεῖ παθεῖν ἃ δ' ἦν μαθεῖν,
> Τί δεῖ μαθεῖν; χρὴ γὰρ παθεῖν.

The two collections of epigrams most accessible to the English reader are Booth's *Epigrams, Ancient and Modern*, 1863, and Dodd's *The Epigrammatists*, 1870. In the appendix to the latter is a pretty full bibliography, to which the following list may serve as a supplement:—Thomas Corræus, *De toto eo poematis genere quod epigramma dicitur*, Venice, 1569, Bologna, 1590; Cottunius, *De Conficiendo epigrammate*, Bologna, 1632; Vincentius Gallus, *Opusculum de epigrammate*, Milan, 1641; Vavassor, *De epigrammate liber*, Paris, 1669; *Gedanke von deutschen Epigrammatibus*, Leipsic, 1698; *Doctissimorum nostræ ætate italorum epigrammata: Flaminii Moleæ, Naugerii, Cottæ, Lampridii, Sadoleti, et aliorum, cura Jo. Gagnæi*, Paris, c. 1550; Brugière de Barante, *Recueil des plus belles épigrammes des poëtes français*, 2 vols., Paris, 1698; Chr. Aug. Heumann, *Anthologia Latina: hoc est, epigrammata partim a priscis partim junioribus a poetis*, Hanover, 1721; Fayolle, *Acontologie ou dictionnaire d'épigrammes*, Paris, 1817; Geijsbeck, *Epigrammatische Anthologie;* Sauvage, *Les quêpes gauloises: petit encyclopédie des meilleurs épigrammes, etc., depuis Clement Marot jusqu'aux poetes de nos jours*, 1859; *La récréation et passe-temps des tristes: recueil d'épigrammes et de petits contes en vers réimprimé sur l'édition de Rouen 1595*, etc., Paris, 1863. A large number of epigrams and much miscellaneous information in regard to their origin, application, and translation is scattered through *Notes and Queries*. A pleasant anonymous article on the subject is printed in *The Quarterly Review*, No. 233

EPILEPSY (from ἐπί, upon, and λαμβάνω, to seize), synonym, *Falling Sickness*. The term as generally understood is applied to a nervous disorder characterized by a fit of sudden loss of consciousness, attended with convulsions. There may, however, exist manifestations of epilepsy much less marked than this, yet equally characteristic of the disease; while, on the other hand, it is to be borne in mind that many other attacks of a convulsive nature have the term "epileptic" or "epileptiform" applied to them quite erroneously, as they can in no strictly scientific sense be held to be epilepsy.

Epilepsy was well known in ancient times, and was regarded as a special infliction of the gods, hence the names *morbus sacer, morbus divus*. It was also termed *morbus Herculeus*, from Hercules having been supposed to have been epileptic, and *morbus comitialis*, from the circumstance that when any member of the forum was seized with an epileptic fit the assembly was broken up. *Morbus caducus, morbus lunaticus astralis, morbus demoniacus, morbus major*, were all terms employed to designate epilepsy.

The forms which this disease manifests have been differently described by different writers, but there are two well-marked varieties of the epileptic seizure, either of which may exist alone, or both may be found to occur together in the same individual. To these the terms *epilepsia gravior* and *epilepsia mitior, le grand mal* and *le petit mal*, are usually applied. The former of these, if not the more common, is at least that which attracts most attention, being what is generally known as an epileptic fit.

Although in most instances such an attack comes on suddenly, it is in many cases preceded by certain premonitory indications or warnings, which may be present for a greater or less time previously. These are of very varied character, and may be in the form of some temporary change in the disposition, such as unusual depression or elevation of spirits, or of some alteration in the look. Besides these general symptoms, there are frequently peculiar sensations which immediately precede the onset of the fit, and to such the name of "aura epileptica" is applied. In its strict sense this term refers to a feeling of a breath of air blowing upon some part of the body, and passing upwards towards the head. This sensation, however, is not a common one, and the term has now come to be applied to any peculiar feeling which the patient experiences as a precursor of the attack. The so-called "aura" may be of mental character, in the form of an agonizing feeling of momentary duration; of sensorial character, in the form of pain in a limb or in some internal organ, such as the stomach, or morbid feeling connected with the special senses; or, further, of motorial character, in the form of contractions or trembling in some of the muscles. When such sensations affect a limb, the employment of firm compression by the hand or by a ligature occasionally succeeds in warding off an attack. The aura may be so distinct and of such duration as to enable the patient to lie down, or seek a place of safety before the fit comes on.

The seizure is usually preceded by a loud scream or cry, which is not to be ascribed, as was at one time supposed, to terror or pain, but is due to the convulsive action of the muscles of the larynx, and the expulsion of a column of air through the narrowed glottis. If the patient is standing he immediately falls, and often sustains serious injury. Unconsciousness is complete, and the muscles generally are in a state of stiffness or tonic contraction, which will usually be found to affect those of one side of the body in particular. The head is turned by a series of jerks towards one or other shoulder, the breathing is for the moment arrested, the countenance first pale then livid, the pupils dilated, and the pulse rapid. This, the first stage of the fit, generally lasts for about half a minute, and is followed by the state of clonic (*i.e.*, tumultuous) spasm of the muscles, in which the whole body is thrown into violent agitation, occasionally so great that bones may be fractured or dislocated. The eyes roll wildly, the teeth are gnashed together, and the tongue and cheeks are often severely bitten. The breathing is noisy and laborious, and foam (often tinged with blood) issues from the mouth, while the contents of the bowels and bladder are ejected. The aspect of the patient in this condition is shocking to witness, and the sight has been known to induce a similar attack in an onlooker. This stage lasts for a period varying from a few seconds to several minutes, when the convulsive movements gradually subside, and relaxation of the muscles takes place, together with partial return of consciousness, the patient looking confusedly about him and attempting to speak. This, however, is soon followed by drowsiness and stupor, which may continue for several hours, when he awakes either apparently quite recovered, or fatigued and depressed, and occasionally in a state of excitement which sometimes assumes the form of mania.

Epileptic fits of this sort succeed each other with varying degrees of frequency, and occasionally, though not frequently, with regular periodicity. In some persons they only occur once in a lifetime, or once in the course of many years, while in others they return every week or two, or even are of daily occurrence, and occasionally there are numerous attacks each day. According to Dr. Reynolds, there are four times as many epileptics who have their attacks more frequently than once a month as there are of those whose attacks recur at longer intervals. When the fit returns it is not uncommon for one seizure to be followed by another within a few hours or days. Occasionally there occurs a constant succession of attacks extending over many hours, and with such rapidity that the patient appears as if he had never come out of the one fit. The term *status epilepticus* is applied to this condition, which is sometimes followed with fatal results. In many epileptics the fits occur during the night as well as during the day, but in some instances they are entirely nocturnal, and it is well known that in such cases the disease may long exist and yet remain unrecognized either by the patient or the physician.

The other manifestation of epilepsy, to which the names *epilepsia mitior* or *le petit mal* are given, differs from that above described in the absence of the convulsive spasms. It is also termed by some authors *epileptic vertigo* (giddiness), and consists essentially in the sudden arrest of volition and consciousness, which is of but short duration, and may be accompanied with staggering or some alteration in position or motion, or may simply exhibit itself in a look of absence or confusion, and, should the patient happen to be engaged in conversation, by an abrupt termination of the act. In general it lasts but a few seconds, and the individual resumes his occupation without perhaps being aware of anything having been the matter. In some instances there is a degree of spasmodic action in certain muscles which may cause the patient to make some unexpected movement, such as turning half round, or walking abruptly aside, or may show itself by some unusual expression of countenance, such as squinting or grinning. There may be some amount of "aura" preceding such attacks, and also of faintness following them. The *petit mal* most commonly co-exists with the *grand mal*, but has no necessary connection with it, as each may exist alone. According to Trousseau, the *petit mal* in general precedes the manifestation of the *grand mal*, but sometimes the reverse is the case.

Although the above account represents the phenomena usually observed in the two varieties of epilepsy, it is to be noted that many cases occur exhibiting other symptoms which cannot be included in such a general description.

Epilepsy appears to exert no necessarily injurious effect upon the general health, and even where it exists in an aggravated form is quite consistent with a high degree of bodily vigor. It is very different, however, with regard to its influence upon the mind; and the question of the relation of epilepsy to insanity is one of great and increasing importance. Allusion has already been made to the occasional occurrence of maniacal excitement as one of the results of the epileptic seizure. Such attacks, to which the name of *furor epilepticus* is applied, are generally accompanied with violent acts on the part of the patient, rendering him dangerous, and demanding prompt measures of restraint. These attacks are by no means limited to the more severe form of epilepsy, but appear to be even more frequently associated with the milder form—the epileptic vertigo—where they either replace altogether or immediately follow the short period of absence characteristic of this form of the disease. Numerous cases are on record of persons known to be epileptic being suddenly seized, either after or without apparent spasmodic attack, with some sudden impulse, in which they have used dangerous violence to those beside them, irrespective altogether of malevolent intention, as appears from their retaining no recollection, whatever, after the short period of excitement, of anything that had occurred; and there is reason to believe that crimes of heinous character, for which the perpetrators have suffered punishment, have been committed in a state of mind such as that now described. The subject is obviously one of the greatest medico-legal interest and importance in regard to the question of criminal responsibility, and it is now justly receiving much greater attention than formerly.

Apart, however, from such marked and comparatively rare instances of what is termed epileptic insanity, the general mental condition of the epileptic is in a large proportion of cases unfavorably affected by the disease. There are doubtless examples (and their number according to statistics is estimated at less than one-third) where, even among those suffering from frequent and severe attacks, no departure from the normal condition of mental integrity can be recognized. But in general there exists some peculiarity, exhibiting itself either in the form of defective memory, or diminishing intelligence, or, what is perhaps as frequent, in irregularities of temper, the patient being irritable or perverse and eccentric. In not a few cases there is a steady mental decline, which ends in dementia or idiocy. It is stated by some high authorities that epileptic women suffer in regard to their mental condition more than men. It also appears to be the case that the later in life the disease shows itself the more likely is the mind to suffer. Neither the frequency nor the severity of the seizures seems to have any necessary influence in the matter; and the general opinion appears to be that the milder form of the disease is that with which mental failure is more apt to be associated.

Epilepsy has ever been regarded as one of the most formidable diseases that can afflict mankind, and much labor has been bestowed upon the investigation of its pathology. It must, however, be confessed that morbid anatomy has hitherto failed to throw any satisfactory light upon the real nature of this disease. In the very rare instances of persons dying in the epileptic fit, the *post mortem* appearances presented by the brain are in general either entirely negative, or of such indefinite character as cerebral congestion, while, on the other hand, in chronic cases of epilepsy, such lesions as atrophy and degeneration of brain substance or vascular disease are frequently met with, but are, as is well known, common to many other forms of nervous disease, and are much more probably the consequences rather than the causes of the epileptic attacks. The disease is commonly regarded as one of functional character.

It is impossible in this notice to refer in detail to the various doctrines which have been held by physicians and pathologists upon the subject of the site of the lesion in epilepsy. It is now generally admitted, as the result both of observation and experiment, that the upper part of the spinal cord, including the medulla oblongata, pons varolii, and other ganglia at the base of the brain, are the parts affected in epilepsy; and it is supposed that a condition of irritability or over-action of the ganglionic nerve cells in these parts, which are concerned in controlling the vasomotor nerves, the muscles of respiration, and the muscular system generally, is the immediate cause of a fit. The fact, however, of the loss of consciousness and other sensorial phenomena being the earliest occurrences in the attack, preceding the convulsions, and in not a few instances, as has already been observed, being the only indications present, is regarded by some as pointing to other parts of the cerebral centres as being implicated in the origination of the fit. The whole subject, however, is still involved in obscurity. There are, nevertheless, certain facts which have been brought to light in the investigation of this disease which are of interest and importance as regards its causation.

The influence of hereditary predisposition in epilepsy is very marked. It is necessary, however, to bear in mind the point so forcibly insisted on by Trousseau in relation to epilepsy, that hereditary transmission may be either direct or indirect, that is to say, that what is epilepsy in one generation may be some other form of neurosis in the next, and conversely, nervous diseases being remarkable for their tendency to transformation in their descent in families. Where epilepsy is hereditary, it generally manifests itself at an unusually early period of life. A singular fact, which also bears to some extent upon the pathology of this disease, was brought to light by Dr. Brown-Séquard in his experiments, namely, that the young of animals which had been artificially rendered epileptic were liable to similar seizures. In connection with the hereditary transmission of epilepsy it must be observed that all authorities concur in the opinion that this disease is one among the baneful effects that often follow marriages of consanguinity. Further, there is reason to believe that intemperance, apart altogether from its direct effect in favoring the occurrence of epilepsy, has an evil influence in the hereditary transmission of this as of other nervous diseases. A want of symmetry in the formation of the skull and defective cerebral development are not unfrequently observed where epilepsy is hereditarily transmitted.

Age is of importance in reference to the production of epilepsy. The disease may come on at any period of life, but it appears from the statistics of Dr. Reynolds and others, that it most frequently first manifests itself between the ages of ten and twenty years, the period of second dentition and puberty, and again at or about the age of forty.

Among other causes which are influential in the development of epilepsy may be mentioned sudden fright, prolonged mental anxiety, over-work, and debauchery. Epileptic fits also occur in connection with injuries of the head and organic disease of the brain, as well as with a depraved state of the general health, and with irritations in distant organs, as seen in the fits occurring in dentition, in kidney disease, and as the result of worms in the intestines. The epileptic symptoms traceable to these causes are sometimes termed *sympathetic* or *eccentric epilepsy;* while, on the other hand, many authorities refuse to designate attacks thus brought about by the name epilepsy, unless the symptoms exhibit a liability to return even after their cause has been removed, which would seem to be sometimes the case.

Epilepsy is occasionally feigned for the purpose of extortion, but an experienced medical practitioner will rarely be deceived; and when it is stated that although many of the phenomena of an attack, particularly the convulsive movements, can be readily simulated, yet that the condition of the pupils, which are dilated during the fit, cannot be feigned, and that the impostor seldom bites his tongue or injures himself, deception is not likely to succeed even with non-medical persons of intelligence.

The *treatment* of epilepsy can only be briefly alluded to here. During the fit little can be done beyond preventing as far as possible the patient from injuring himself while unconsciousness continues. Tight clothing should be loosened, and a cork or pad inserted between the teeth. When the fit is of long continuance, the dashing of cold water on the face and chest, or the inhalation of chloroform, or, as has been recently proposed, of nitrite of amyl, may be useful; and in some cases, where there is great congestion of the face and threatening asphyxia, blood-letting may be called for; in general, however, the fit terminates independently of any such measures. When the fit is over the patient should be allowed to sleep, and have the head and shoulders well raised.

In the intervals of the attacks the general health of the patient is one of the most important points to be attended to. The strictest hygienic rules should be observed, and all such causes as have been referred to as favoring the development of the disease should as far as possible be avoided. Of medicinal remedies for epilepsy there are innumerable varieties, but only a few deserve mention as possessing any efficacy in controlling or curing the disease. For no disease has a greater number of specifics been vaunted and found to be useless. The metallic salts, especially those of zinc, silver, and arsenic, are much employed, and apparently with benefit in some cases, but they seldom can be continued for any great length of time, owing to their liability to produce evil effects upon the health. The two remedies which have been found most serviceable are belladonna and bromide of potassium. The former of these has the strong recommendation of Trousseau, who advises its administration either as a pill composed of the extract and powdered leaves, or in the form of atropia in gradually increased doses, and continued for a length of time. This drug certainly succeeds in many cases in diminishing the number of the attacks, but it has not yielded such encouraging results as have been attained by the other substance above mentioned, the bromide of potassium, which is the remedy now generally employed in the treatment of epilepsy. This salt, given in from 10 to 30 grain doses three times a day, is generally followed with some amelioration of the symptoms either in regard to the severity or frequency of the attacks, and in a few instances with apparent cure. Its employment, moreover, can be persevered with for a long time with little inconvenience. Some physicians combine with it an equal proportion of the analogous salt, the bromide of ammonium, while others employ belladonna along with the bromides, and apparently with good effect. As adjuvants to these measures, counter-irritation to the nape of the neck by blisters or setons is sometimes attended with benefit.

(J. O. A.)

EPIMENIDES, a poet and prophet of Crete, was born at Phæstus, or according to others at Gnossus, in the 7th century before the Christian era. In the account of his life as given by Diogenes Laertius (i. 12), it is impossible to distinguish between what may be true and what is obviously fabulous. When keeping his father's sheep one day, he is said to have retired into a cave, where he fell into a profound sleep which lasted fifty-seven years. Returning home to the altered abodes of his family, he was hailed as the especial favorite of the gods, and venerated as the possessor of superhuman wisdom. He was invited by Solon to Athens (about 596 B.C.), in order to give the sanction of his sacred presence to the purification of the city previous to the promulgation of the political code of the great lawgiver. Having accomplished the desired lustration by the performance of certain religious rites, Epimenides was loaded by the Athenians with wealth and honors. He refused, however, to accept their gifts, contenting himself with a branch of the sacred olive, and the exaction of a promise of perpetual friendship between Athens and Gnossus. The death of Epimenides is said to have taken place in Crete, although Sparta boasted of possessing his tomb, and doubtless he may have travelled into many different countries, if (as one tradition runs) he attained the age of nearly three hundred years. He was said to have written a poem on the Argonautic expedition, and several other poetical works, and there are grounds for supposing that he may have done so; but these, with a variety of undoubtedly spurious prose treatises attributed to him in ancient times, are now entirely lost. Epimenides is supposed to be the Cretan prophet to whom St. Paul alludes in his epistle to Titus (i. 12).

ÉPINAL, a town of France, capital of the department of Vosges, is situated on both sides of the Moselle, at the foot of the Vosges chain of mountains, and on the railway from Nancy to Belfort, 35 miles S.S.E. of Nancy and 200

E.S.E. of Paris. The town is tolerably well built, and in its vicinity are some beautiful promenades. It was formerly fortified, and has still the remains of an ancient castle. Its principal buildings are the Gothic parish church, the hotel of the prefecture, the communal college, the barracks, and the departmental prison. It has also a large public library, a museum of paintings and antiquities, a chamber of commerce, and schools of design and music. Its principal manufactures are woollen and linen fabrics, earthenware, cutlery, paper, leather, and chemical products; and it has a considerable trade in horses, cattle, corn, wine, and wood. Épinal originated towards the end of the 10th century with the founding of a monastery by the bishop of Metz, who ruled the town till 1444, when its inhabitants placed themselves under the protection of Charles VII. In 1466 it was transferred to the duchy of Lotharingia, and in 1766 it was, along with that duchy, incorporated with France. It was occupied by the Germans on the 12th October, 1870, after a short fight, and until the 15th was the head-quarters of General von Werder. The population in 1872 was 10,938.

ÉPINAY, Louise Florence Pétronille de la Live d' (1725–1783), a French authoress, well known on account of her *liaisons* with Rousseau and Baron von Grimm, and her acquaintanceship with Diderot, D'Alembert, D'Holbach, and other French *littérateurs*, was born at Paris in 1725. Her father, Tardieu d'Esclavelles, a brigadier of infantry, was killed in battle when she was nineteen years of age; and in recognition of his services, the Government arranged that she should marry her cousin De la Live d'Épinay, on whom they bestowed the office of farmer-general. The marriage was an unhappy one; and according to her own version of the matter, she believed that the prodigality, dissipation, and infidelities of her husband justified her in regarding herself as freed from all the obligations implied in the conjugal bond. Conceiving a strong attachment for J. J. Rousseau, she in 1756 built for him, in the valley of Montmorency, a cottage which she named the "Hermitage;" and there, notwithstanding the pleasantries and gay remonstrances of his friends at his forsaking the brilliant society of Paris, he sought for a time to enjoy the quiet and natural rural pleasures for which he always expressed a strong preference. Rousseau, in his *Confessions*, affirmed that the attachment was all on her side; but as, after her *liaison* with Grimm, he became her bitter enemy and detractor, not much weight can be given to his statements on this point. In Grimm's absence from France (1775–76), Madame d'Épinay continued, under the superintendence of Diderot, the correspondence he had begun with various European sovereigns. She spent the whole of her after life at the "Hermitage," enjoying the society of a small circle of *littérateurs*, and occupying her spare time chiefly in various kinds of literary composition. She died 17th April, 1783. Her *Conversations d'Émilie*, composed for the education of her grand-daughter, the Comtesse d'Épinay, was crowned by the French Academy in 1783. The *Mémoires et Correspondance de Mme. d'Épinay, renfermant un grand nombre de lettres inédites de Grimm, de Diderot, et de J. J. Rousseau, ainsi que des détails*, etc., was published at Paris, 1818. The *Mémoires* are written by herself in the form of a sort of autobiographic romance, and although they contain much that is mere imagination, and also a great deal of misrepresentation, they are of great value as a picture of the manners and habits of the most eminent Frenchmen of the time. All the letters and documents published along with the *Mémoires* are genuine. Many of Madame d'Épinay's letters are contained in the *Correspondance de l'abbé Galiani* (Paris, 1818). Two anonymous works, *Lettres à mon Fils*, Geneva (1758) and *Mes Moments Heureux* (Geneva, 1758), are attributed to Madame d'Épinay.

EPIPHANIUS, St., a celebrated father of the church, was born in the beginning of the 4th century at Bezanduca, a village of Palestine, near Eleutheropolis. He is said to have been of Jewish extraction. In his youth he resided in Egypt, where, under the Gnostics, he began an ascetic course of life; and on his return to Palestine he became a zealous disciple of the patriarch Hilarion, and eventually the president of a monastery which he founded near his native place. In 367 he was nominated bishop of Constantia, previously known as Salamis, the metropolis of Cyprus—an office which he held till his death in 402. Zealous for the truth, but passionate, bigoted, and ignorant, he devoted himself to furthering the spread of the recently established monasticism, and to the confutation of heresy, of which he regarded Origen and his followers as the chief representatives. The first of the Origenists that he attacked was John, bishop of Jerusalem, whom he denounced from his own pulpit at Jerusalem in terms so violent that the bishop sent his archdeacon to request him to desist; and afterwards, instigated by Theophilus, bishop of Alexandria, he proceeded so far as to summon a council of Cyprian bishops to condemn the errors of Origen. His next blow was aimed at Chrysostom, the patriarch of Constantinople, and a pretext was found in the shelter which he had given to four Nitrian monks whom Theophilus had expelled on the charge of Origenism. Finding himself baffled by the authority of Chrysostom, Epiphanius proceeded in extreme old age to Constantinople, and endeavored to subvert his influence at the court; but having presumptuously announced to the empress Eudoxia that her son, who was then ill, would die unless she ceased to favor the friends of Origen, he was immediately dismissed, and died on the passage home to Cyprus. At his parting interview with Chrysostom, he is said to have expressed the hope that that patriarch "would not die a bishop;" and Chrysostom, in retaliation, uttered a wish that "he would never get back in safety to his own country." As both these malevolent wishes were literally accomplished, there is reason to suppose that the story may have been fabricated after the event. The principal works of Epiphanius are his *Panarion*, or treatise on heresies, of which he also wrote an abridgment; his *Ancoratus*, or discourse on the faith; and his treatise on the weights and measures of the Jews. These, with two epistles to John of Jerusalem and Jerome, are his only genuine remains. He wrote a large number of works which are lost. The best edition of his works is that of the Jesuit Petavius, 2 vols. fol., Paris, 1622. In allusion to his knowledge of Hebrew, Syriac, Egyptian, Greek, and Latin, Jerome styles Epiphanius *Pentaglottos* or Five-tongued; but if his knowledge of languages was really so extensive, it is certain that he was utterly destitute of critical and logical power. His early asceticism seems to have imbued him with a love of the marvellous; and his religious zeal served only to increase his credulity, so that many of the most absurd legends in the early church have received the sanction of his authority. His works are, in fact, chiefly valuable from the quotations which they embody.

EPIPHANY, Festival of, one of the chief festivals of the Christian church, kept on the 6th of January, as the closing day of the Christmas commemoration, the English "Twelfth Day." The name "Epiphany" (*ἡ 'Επιφάνεια*, or *τα 'Επιφάνια*, also *Θεοφάνια*, and *Χριστοφάνια*) marks it out as a commemoration of the manifestation of Jesus Christ to the world as the Son of God. This manifestation has been variously interpreted in different sections of the church. In the East, where, as its Greek name indicates, the festival had its origin, it was associated with our Lord's baptism as the "manifestation" of Christ as Son of God by the voice from heaven and the descent of the Holy Spirit. From this connection the Epiphany became one of the chief days for the baptizing of catechumens. The water in the font was consecrated on this day, and bottles of the sacred fluid were carried home by the faithful and preserved till the day came round again. Baptism being regarded as the illumination of the soul (*φωτισμός*), this day gained the title of "the lights," or the "day of lights" (*τὰ φῶτα, ἡμέρα τῶν φώτων*). The Epiphany was never a day of baptism in the Western Church. This commemoration of Christ's baptism arose in the East before that of His Nativity. From a forced interpretation of Luke iii. 23, our Lord was supposed to have been baptized on the thirtieth anniversary of His birth, and the two events were commemorated on the same day, January 6. Other manifestations were also associated with these two, especially the displays of our Lord's miraculous power at the marriage feast at Cana of Galilee, and the feeding of the five thousand. It was not till the latter half of the 4th century that the Nativity had a distinct celebration in the East on the 25th of December. In the Western Church the two commemorations have always been separated; and the Epiphany has been associated with the visit of the Magi, or Wise Men of the East, to the infant Saviour, almost to the exclusion of any other reference. These mysterious strangers, who in process of time developed into three kings, named Caspar, Melchior, and Balthasar, descended respectively from Ham, Shem, and Japheth, being regarded as the first-fruits of the heathen world to Christ, the festival obtained the designation it bears in the English Common Prayer Book, "the Epiphany, or manifestation of Christ to the Gentiles." In the Latin Church it is known as "festum trium regum." The popular name in Rome is *la Beffana*, a corruption of the mediæval "Bethphania," derived from the manifestation in the house (Hebrew, *beth*) at Cana of Galilee. The earliest mention of the festival in the West is in the account given by Ammianus Marcellinus of a visit paid by Julian to a church at Vienne on this day (lib. xxi. c. 2). It eventually took rank as a leading church festival. Abstinence from servile work, which had been enjoined by the Apostolical Constitutions (lib. v. c. 13, lib. viii. c. 33), was enacted by the emperors Theodosius II. and Justinian, together with the suspension of public games and legal business. Another custom of the early church was for the metropolitans at the Epiphany to announce to their suffragan bishops the date of Easter and the other movable feasts (*Indictio Paschalis*) by letters known as "Festal Epistles." To describe the curious and picturesque customs connected with this festival would carry us far beyond our limits. They may be found in Hone's *Every-Day Book* and *Year Book*, Chambers's *Book of Days*, and Brand's *Popular Antiquities*. One custom deserves to be particularized. The sovereigns of England on this day make an oblation of gold, frankincense, and myrrh at the altar of the Chapel Royal. This is now performed by deputy, but till comparatively recent times the offering was made in person.

EPIRUS, or EPEIRUS, was that part of Northern Greece which stretched along the Ionian Sea from the Acroceraunian promontory on the N. to the Ambracian gulf on the S., and was conterminous on the landward side with Illyria, Macedonia, and Thessaly—thus corresponding to the southern portion of Albania. The name Epirus (Ἤπειρος, or in the local dialects Ἄπειρος) signified mainland, and was originally applied to the whole coast southward to the Corinthian gulf, in contradistinction to the neighboring islands, Corcyra, Leucas, etc. The country is all more or less mountainous, especially towards the east, where the Pindus chain, in its main massif of Lacmon, feeds the fountains of nearly all the great rivers of Northern Greece,—the Peneus, the Achelous, the Arachthus, and the Aous. In ancient times it did not produce corn sufficient for the wants of its inhabitants; but it was celebrated, as it has been almost to the present day, for its cattle and its horses. According to Theopompus, a writer of the fourth century B.C., the Epirots were divided into fourteen independent tribes, of which the principal were the Chaones, the Thesproti, and the Molossi. The Chaones, identified by one theory with the Chones who dwelt on the Tarentine gulf in Italy, inhabited the northern portion of the country along the Acroceraunian shore, the Molossians the inland district of which the lake of Pambotis or Yannina may be regarded as the centre, and the Thesprotians the region to the north of the Ambracian gulf. Aristotle places in Epirus the original home of the Hellenes, though the common opinion among his countrymen traced them rather to Thessaly. In any case Epirus, in spite of its distance from the chief centres of Greek thought and action, and the fact that its inhabitants were hardly regarded as other than barbarians, exerted even at an early period no small influence on Greece, by means more especially of the oracle of Dodona. One of the earliest and most flourishing settlements of the Greeks proper in Epirus was the Corinthian colony of Ambracia, which gave its name to the neighboring gulf. The happy results of the experiment appear to have tempted other Greek states to imitate the example, and Elatria, Bucheta, and Pandosia bore witness to the enterprise of the people of Elis. Among the other towns in the country the following were of some importance:—in Chaonia—Palæste and Chimæra, fortified posts to which the dwellers in the open country could retire in time of war; Onchesmus or Anchiasmus, now represented by Santi Quarante, or ἡ σκάλα τῶν Ἁγίων Σάραντα, the Harbor of the Forty Saints; Phœnice, still so called, the wealthiest of all the native cities of Epirus, and after the fall of the Molossian kingdom the centre of an Epirotic League; Buthroton, the modern Butrinto; Phanote, well known from its connection with the wars of the Romans; and Hadrianopolis, founded by the emperor whose name it bore; in Thesprotia—the Elean settlements already mentioned; Cassope, the *chef lieu* of the Cassopæans, the most powerful of the Thesprotian clans; Ephyra, afterwards Cichyrus, a very ancient site, identified by Leake with the monastery of St. John three or four miles from Phanari, but by Bursian with the ruins on the hill of Kastri at the northern end of the Acherusian Lake; and in Molossia—Passaron, where the kings were wont to take the oath of the constitution and receive their people's allegiance; and Tecmon, Phylace, and Horreum, all of doubtful identification. The Byzantine town of Rogus is probably the same as the modern Luro, formerly known as Oropus.

History.—The kings or rather chieftains of the Molossians, who ultimately extended their power over all Epirus, claimed to be descended from Pyrrhus, son of Achilles, who, according to the legend, settled in the country after the sack of Troy, and transmitted his kingdom to Molossus, his son by Andromache. The early history of the dynasty is very obscure; but Admetus, who lived in the fifth century B. C., has become famous for his hospitable reception of the banished Themistocles, in spite of the grudge that he must have harbored against the great Athenian, who had persuaded his countrymen to refuse the alliance tardily offered by the Molossian chief when their victory against the Persians was already secured. He was succeeded about 429 B.C. by his son or grandson, Tharymbas or Arymbas I., who, being placed by a decree of the people under the guardianship of Sabylinthus, chief of the Atintanes, was educated at Athens, and thus became at a later date the introducer of a higher kind of civilization among his subjects. Alcetas, the next king mentioned in history, was contemporary with Dionysius of Syracuse (about 385 B.C.) and was indebted to his assistance for the recovery of his throne. His son Arymbas II. (who succeeded by the death of his brother Neoptolemus) ruled with prudence and equity, and gave encouragement to literature and the arts. To him Xenocrates of Chalcedon dedicated his four books on the art of governing; and it is specially mentioned that he bestowed great care on the education of his brother's children. Troas, one of his nieces, became his own wife; and Olympias, the other, was married to Philip of Macedon, and had the honor of giving birth to Alexander the Great. On the death of Arymbas, his nephew Alexander, the brother of Olympias, was put in possession of the throne by the assistance of Philip, who was afterwards assassinated on the occasion of the marriage of the youthful king with his daughter Cleopatra. Alexander was the first who bore the title of King of Epirus, and he raised the reputation of his country amongst foreign nations. His assistance having been sought by the Tarentines against the Samnites and Lucanians, he made a descent, 332 B.C., at Pæstum, near the mouth of the river Silarus, and reduced several cities of the Lucani and Bruttii; but in a second attack upon Italy he was surrounded by the enemy, defeated, and slain, near the city Pandosia, in the Bruttian territory.

Æacides, the son of Arymbas II., succeeded Alexander, and espoused the cause of Olympias against Cassander; but he was dethroned by his own soldiers, and had hardly regained his position when he fell, 313 B.C., in battle against Philip, brother of Cassander. He had, by his wife Phthia, the celebrated Pyrrhus, and two daughters, Deidamia and Troas, of whom the former married Demetrius Poliorcetes. His brother Alcetas, who succeeded him, continued the war with Cassander till he was defeated; and he was ultimately put to death by his rebellious subjects, 295 B.C. The name of Pyrrhus, who next ascended the throne, gives to the history of his country an importance which it would never have otherwise possessed; but for an account of his life we must refer to the article PYRRHUS.

Alexander, his son, who succeeded in 272 B.C., attempted to seize on Macedonia, and defeated Antigonus Gonatas, but was himself shortly afterwards driven from his kingdom by Demetrius. He recovered it, however, and spent the rest of his days in peace. Two other insignificant reigns brought the family of Pyrrhus to its close, and Epirus was thenceforward governed by a prætor, elected annually in a general assembly of the nation held at Passaron. It imprudently espoused the cause of Perseus in his ill-fated war against the Romans, 168 B.C.; and it was consequently exposed to the fury of the conquerors, who destroyed, it is said, 70 towns, and carried into slavery 150,000 of the inhabitants. It never recovered from this blow. At the dissolution of the Achæan league, 146 B.C., it became part of the province of Macedonia, receiving the name Epirus Vetus, to distinguish it from Epirus Nova, which lay to the east.

On the division of the empire it became the inheritance of the emperors of the East, and remained under them until the taking of Constantinople by the Latins, in 1204, when Michel Angelus Comnenus seized on Ætolia and Epirus. On the death of Michel in 1216, these countries fell into the hands of his brother Theodore. Thomas, the last of the direct line, was murdered in 1318 by his nephew Thomas, lord of Zante and Cephalonia, and his dominions were dismembered. Not long after, Epirus was overrun by the Samians and Albanians, and the confusion which had been growing since the division of the empire was worse confounded still. Charles II. Tocco, lord of Cephalonia and Zante, obtained the recognition of his title of despot of Epirus from the emperor Manuel Comnenus, in the beginning of the 15th century; but his family was deprived of their possession in 1431 by Amurath II. In 1443, Scanderbeg, king of Albania, made himself master of a considerable part of Epirus; but on his death it fell into the power of the Venetians, from whom it passed again to the Turks, under whose domination it still remains.

EPISCOPACY. By Episcopacy we understand that form of church organization in which the chief ecclesiastical authority within a defined district or diocese is vested in bishops (*episcopi*) having in subordination to them priests, or presbyters, and deacons, and with the power of ordination. Of this form of government there are traces in apostolic times; evidences of its existence become increasingly frequent in the sub-apostolic period; until when the church emerges from the impenetrable cloud which covers the close of the 1st and the beginning of the 2d century, we find every Christian community governed by a chief functionary, uniformly styled its "bishop," with two inferior orders of ministers under them, known as "presbyters" and "deacons." It may be regarded as an established fact that before the middle of the 2d century diocesan Episcopacy had become the rule in every part of the then Christian world, and we have now to inquire when and under what circumstances this form of government arose, and with what amount of authority it is invested. On these points the most opposite opinions have been maintained. In the words of Dr. Lightfoot (to whose admirable dissertation "On the Christian Ministry," appended to his *Commentary on the Epistle to the Philippians*, we, though differing from him in some points, would once for all acknowledge our obligation), "Some have recognized in Episcopacy an institution of divine origin, absolute and indispensable; others have represented it as destitute of all apostolic sanction and authority." Some, that is, regard it as of the *de esse* of a church, so that no Christian community can have any right to claim to be considered, in the true sense, a branch of the church catholic if it have not episcopal organization. Others, on the other hand, consider it as of the *de bene esse* of a church, desirable to its good government, and to the maintenance of evangelical truth and apostolical order, but not essential to its existence. It will be our object in this article to review the evidence as to the origin of Episcopacy afforded by history, and to present the facts and the plain inferences from them in a candid and dispassionate spirit.

I. In examining the question of the divine authority of Episcopacy, we have to consider carefully what we mean by the phrase. Do we intend that Episcopacy stands on the same level as Baptism and the Lord's Supper as a direct ordinance of Christ "generally necessary for salvation"? or do we mean that it was called into being by the apostles and first teachers of the Christian church under that most real, though perhaps to them insensible, direction of the Holy Spirit, to which their decisions and actions are continually ascribed in the sacred record (Acts viii. 29, x. 19, xi. 12, xiii. 2, xv. 28, xvi. 6, 7, xix. 21, xx. 23)? Of the former opinion, though asserted as an unquestionable fact by many learned defenders of Episcopacy, we may safely assert that there is not a trace in the New Testament. That the episcopal organization of His church was among the "things pertaining to the kingdom of God" which formed the subject of the intercourse of Christ and the twelve in the interval between His resurrection and His ascension is a mere hypothesis destitute of the semblance of proof. Neither the Acts nor the Epistles contain the slightest hint of any such authoritative communication being made before our Lord's ascension, or of any direct revelation to that effect subsequent to that event, binding on the church for all time. The conclusion that would be naturally drawn from the brief and scanty references to the organization of the Christian ministry in Holy Scripture is that the apostles were left free to act, under the direction of the Holy Spirit, as they might from time to time judge to be most for the good of the church. There can be no question that this was so in the appointment of the seven whose office is commonly identified with the Diaconate (Acts vi.); and, though the evidence is less distinct, it appears to have been the case with the Presbyterate (Acts xiv. 23), while the authority of Timothy and Titus, in whom we see the first adumbration of diocesan Episcopacy, is plainly represented as delegated by the Apostle Paul with the view of carrying out the arrangements which special circumstances rendered desirable for the particular time and place. There is certainly nothing in the apostle's language to either of them to support the idea that by such delegation he was carrying into effect a divine ordinance of perpetual obligation.

If, however, we interpret the expression "divine authority" in the larger sense, as including all that the apostles did, as the holders of Christ's express commission—"as my Father hath sent me even so send I you" (John xx. 21)—through the inspiration of the Holy Ghost, for the edification of the church of which they were the divinely appointed governors and propagators, there need be as little scruple in allowing the divine authority of Episcopacy as there is in the case of other ordinances of the Christian church, such as the observation of the Lord's day, the baptism of infants, and confirmation. An institution of which traces are seen in apostolic times, and which is found prevailing throughout the church in the age succeeding the apostles, and continuing everywhere without a break of continuity to the 16th century, and in most parts of Christendom to the present day, cannot be looked upon as anything less than the deliberate expression of the mind of the church. In this qualified sense we may safely adopt the verdict of Hooker, "that if anything in the church's government, surely the first institution of bishops was from heaven,—was even of God,—the Holy Ghost was the author of it, . . . and is to be acknowledged the ordinance of God no less than that ancient Jewish regiment, whereof though Jethro was the deviser, yet after that God had allowed it all men were subject unto it, as to the polity of God, not of Jethro" (*Eccl. Polit.*, bk. vii. c. v. §§ 2, 10).

II. The twelve apostles were the depositaries of Christ's commission as the founders and governors of His church (Matt. xvi. 19, xviii. 18, xxviii. 19, 20; Mark xvi. 15; Luke xxiv. 47, 48; John xx. 21–23). In the Acts we find them its sole directors and administrators. The whole ministry of the church was, in the germ, included in the apostolate, from which it was gradually developed as occasion required by the successive delegation of the powers lodged with the apostles to other members of the church, first as their substitutes and afterwards as their successors. Thus the Christian ministry, as Canon Robertson has remarked (*History of the Christian Church*, vol. i. p. 8), "was developed not from below but from above," not by elevation, but by devolution. The first delegation was to the seven, for the discharge of the secular functions and lower spiritual offices for which the rapid growth of the church rendered the apostles personally unequal. This was succeeded by the delegation of the duties of teaching, government, and discipline to presbyters or elders, especially in congregations (such as those planted by Paul and Barnabas in Asia Minor) over which the apostles were unable to exercise any continuous personal superintendence (Acts xiv. 23). In Hooker's words, "the form or regiment by them established at first was that the laity, or people, should be subject unto a college of ecclesiastical persons which were in every such city appointed for that purpose" (*Eccl. Polit.*, bk. vii. ch. v. § 1). It may be desirable here to remove the confusion which may be produced by the ambiguous use of the word "bishop," ἐπίσκοπος, in the New Testament. It happens in all language that in process of time the meaning of a word changes. That which in one generation is a general term, in the next contracts into a techinal term, or a word which designated one office becomes the title of another. It is so with the word "bishop." In its fundamental sense of an "overseer," "inspector," it was not originally a term of office at all. When it appears as such in the New Testament, it is simply synonymous with "presbyter," the same officer of the church being called indifferently by the one or the other name. The "presbyters" or "elders" of the Ephesian church summoned by St. Paul to meet him at Miletus (Acts xx. 17) are in verse 28 designated by him "bishops," or "overseers," of the flock. In the pastoral epistles the words are used indifferently. Corresponding directions are given to Titus concerning the ordaining of "elders" (Tit. i. 5–7), and to Timothy for the ordination of "bishops" (1 Tim. iii. 1–7), while the identity of the two is further evidenced by the use of the term "bishop" in Tit. i. 7, and "elders," 1 Tim. v. 17–19. St Peter also, when exhorting the presbyters, as their "brother presbyter" (*συμπρεσβύτερος*), to the zealous fulfilment of their charge, speaks of it as "the work of an overseer," or "bishop" (*ἐπισκοποῦντες*) (1 Pet. v. 1, 2). The titles continue synonymous in the epistle of Clement of Rome (*Epist.*, i. §§ 42, 44). That the offices were identical in the apostolic age is also more than once asserted by St Jerome, writing towards the close of the 4th century (*e. g.*, "the apostle shows us plainly that presbyters and bishops are the same; . . . it is proved most clearly that a bishop is the same as a presbyter."—*Epist.* cxlvi.; see also *Epist.* lxix.; and *Ad Tit.* i. 8), as well as by Chrysostom, Theodoret, and others, and may be regarded as indisputable.

Any conclusion, therefore, drawn from the use of the term "bishop" in the New Testament, as to the existence of the episcopal office, would be fallacious. "Things," however, as Hooker has said, "are always ancienter than their names," and letting go the name and coming to the thing, indications may be discovered in the Acts and pastoral epistles of something closely answering to a localized episcopate in apostolic times. James, the Lord's brother, occupies a position in the church at Jerusalem, associated with and yet distinct from and superior to his presbytery, and in some respects, at least in Jerusalem, higher than the apostles themselves, which presents many features of the diocesan episcopate of later times (Acts xii. 17, xv. 13, 19, xxi. 18; Gal. i. 19, ii. 9, 12), and tends to confirm the unanimous statement of early writers that he was the first bishop of Jerusalem. (Hieron., *De Script. Eccles.*, ii.; Euseb., *Hist. Eccl.*, ii. 1.) But in him we have the only example of such an organization presented in the Acts. As Professor Shirley has remarked (*Apostolic Age*, p. 133), his position was in important respects exceptional. Whether one of the twelve or not, he was ranked with the apostles (Gal. i. 19), and his authority was therefore inherent, not derived from them. And therefore for years he remained the only Christian bishop. We have to pass on to the pastoral epistles of St. Paul (the latest that proceeded from his pen) before we again meet with any clear traces of the existence of Episcopacy. The evidence of these epistles, however, is unquestionable, whatever the exact nature of the office to which Timothy and Titus were designated by St. Paul. Whether permanent or temporary, whether their authority was that of diocesan bishops, or, as was more probably the case, of vicars-apostolic, it is certain that their power was a delegated one,—that they were acting as the substitutes of the apostle, and that their duties were in essence identical with those of the episcopate. In Dr. Lightfoot's words, "they were in fact the link between the apostle, whose superintendence was occasional and general, and the bishop, who exercised a permanent supervision over an individual congregation."

If the "angels" of the seven churches addressed in the early chapters of the Apocalypse could be certainly identified with bishops, we should have a further evidence of localized Episcopacy in apostolic times of the highest value. But this interpretation, though very generally accepted, is not sufficiently free from question to bear the strain of argument.

III. An almost impenetrable cloud hangs over the closing years of the 1st and the opening of the 2d century. When it begins to disperse we see an episcopal organization everywhere established, and working with a quiet regularity, which gives no indications of its being a novel experiment, still less of its having been imposed by superior authority on a reluctant community. How is this momentous change, without a counterpart in history, to be accounted for? How, to adopt Professor Shirley's image, can we bridge over "the immense chasm which divides the rudimentary order of the churches planted by St. Paul from the rigorously defined and universal Episcopacy which we find described by Ignatius? The more we look into the circumstances the more the marvel grows."

The solution of this problem which appears to satisfy the various conditions most adequately is—that episcopal organization was developed gradually according to the requirements of different churches; that, as Jerome more than once distinctly asserts, it was called into being by the experience of the need of some coercive power to check dissensions, repress rising heresies, and supplement the authority of the rapidly diminishing body of the apostles; and that, taking Tertullian as a trustworthy exponent of the traditions of the 3d century, its first appearance was connected with the latest survivor of the Twelve, the Apostle John. An examination of the early history of the various churches founded in different parts of the world during the 1st century indicates that the establishment of Episcopacy was not a single definite and formal act proceeding from a central authority, such as the apostolic council after the fall of Jerusalem, imagined without sufficient evidence by Rothe, but a gradual and progressive development, advancing faster in some places than in others, as the growth of the Christian community and the increasing inability of the apostles personally to regulate the churches they had founded required. St. Paul's case presents a picture of what must have been occurring in every part of the Christian world. The apostle had at first to bear in his own person "the care of all the churches" (2 Cor. xi. 28), *i.e.*, of all those which looked up to him as their founder. His insufficiency to bear such a burden alone forced itself upon him as these churches became more numerous. Presbyters and deacons, as Epiphanius has remarked (*Hær.* lxxv. 5), could conduct the administration of a church for a while. But occasions arose, as at Ephesus and Crete, when the continuous presence of an authorized ruler became essential to check serious mischief. Letters, however "weighty," could not compensate for the want of personal influence. It was impossible for the apostle, even when there was no restraint upon his liberty, to meet all the claims upon him in his own person. He therefore delegated his authority (whether temporarily or permanently does not materially affect the question) to others who acted by his commission, and who were charged among other duties with the perpetuation of the Christian ministry (1 Tim. iii. v. 22; 2 Tim. ii. 2; Tit. i. 5). We know from his pastoral epistles that St. Paul did this to meet the special needs of the churches of Ephesus and Crete; and we may not unreasonably believe that the same measure was resorted to by him as well as by the other apostles in other churches where a similar emergency called for it. The language of St. Jerome, which has been so often unfairly employed to weaken the cause of Episcopacy, when properly interpreted points to this origin. He asserts that the episcopal office was established as a remedy against schism, and to put a curb upon the factious spirit which, by the instigation of the devil, had sprung up in various churches, notably in that of Corinth. As long as the apostolic founder of a church was living, and was able personally to interpose, this need for a bishop's authority would not be felt. As this resort closed, as it did very gradually, the development of Episcopacy advanced, with a steady though uneven progress, until it became universal. Jerome's oft-quoted statement that the superiority of bishops to presbyters was rather due to the custom of the church than to any actual ordinance of the Lord, "ex ecclesiæ consuetudine magis quam dispositionis Dominicæ veritate" (Hieron. in *Tit.* i. 5), does not in any way contradict its apostolical origin, which is indeed implied in the context of the passage, but merely signifies that the institution does not rest upon written words of Christ.[1]

If we further ask by what authority it was decided that, in Jerome's words (*u.s.*), "to root out the thickets of heresies all the responsibility should be deferred to a single person," the testimony of antiquity, scanty, it is true, but adequate affirms that this authority was apostolic, and points to St. John as its chief though not exclusive source. Tertullian expressly asserts that "the order of bishops, if traced back to its origin, will rest upon John as its author" (*Adv. Marcion.*, iv. 5). This statement is confirmed by Clement of Alexandria, who relates that St. John, after his return to Ephesus from Patmos, on the death of Domitian, was in the habit of making progresses through the neighboring districts, "in one place to establish bishops, in another to organize whole churches, in another to ordain individuals indicated by the Holy Spirit" (Apud Euseb., *Hist. Eccl.*, iii. 23). Irenæus, the disciple of Polycarp, whose authority on such a fact is indisputable, says that his revered master had been "established by apostles in Asia as bishop in the church of Smyrna" (Iren., iii. 3, § 4), a statement which is confirmed by Tertullian (*De Præscript.*, 32). Polycarp is also distinctly mentioned as bishop of Smyrna, together with Onesimus, bishop of Ephesus, in the genuine letters of Ignatius. The names of Papias of Hierapolis, Sagaris of Laodicea, and Melito of Sardis, all contemporary bishops with Polycarp, supply "irrefragable evidence of the early and wide extension of Episcopacy throughout proconsular Asia, the scene of St. John's latest labors" (Lightfoot, *u.s.*, p. 212), and, unless all historical testimony is to be thrown aside as worthless, demonstrate that the institution of a localized episcopate—what Hooker calls "bishops with restraint," in contrast with the "episcopate at large" exercised by the apostles—"cannot be placed later than the closing years of the 1st century, and cannot be dissevered from the name of St. John" (*Ibid.*, p. 231). There is no reason for supposing that this was the result of the deliberations of an apostolic council, or that it was enforced by an authoritative decree. The doubtful and somewhat legendary tale of Hegesippus, preserved in Eusebius, of the calling of such a council at Jerusalem after the fall of the city and the death of St. James,—even if it be conceded that at that late period any considerable number of the apostolic body were alive, and were within reach of such a summons,—expressly limits its purpose to the appointment of Symeon, the son of Clopas, as a successor to St. James. That this gathering had in view so momentous a step as the establishment of Episcopacy as the form of government for the church for all time is a mere hypothesis, unsupported by any ancient testimony or tradition. Neither have we evidence for any definite decree proceeding either from an apostolic council, or, if that be rejected as baseless, from St. John's individual authority. In the words of Dr. Lightfoot, *u.s.*, p. 205,—

---

[1] We may compare the language of St. Paul, 1 Cor. vii. 10, 12, "to the married I command, yet not I, but the Lord; . . . to the rest speak I, not the Lord," where the contrast is not, as is sometimes supposed, between the apostle speaking by inspiration and without inspiration, but between the apostle's words and an actual "dictum" of our Lord (Mark x. 11). Dean Stanley remarks, "the natural distinction between the sayings of Christ and the sayings of the apostles is here exemplified,—Christ laying down the general rule, the apostles applying it to the particular emergencies which arose out of the relations of the particular churches with which they had to deal" (*Corinthians*, p. 110).

> "The evident utility and even pressing need of such an office, sanctioned by the most venerated name in Christendom, would be sufficient to secure a wide though gradual reception. Such a reception, it is true, supposes a substantial harmony and freedom of intercourse among the churches which remained undisturbed by the troubles of the times; but the silence of history is not at all unfavorable to this supposition. In this way, during the historical blank which extends over half a century after the fall of Jerusalem, Episcopacy was matured, and the Catholic church consolidated."

The opening epoch is the only portion of the history of Episcopacy over which any uncertainty hangs. After the commencement of the 2d century, wherever we hear of the existence of a local church we find it, without any exception, and with hardly any variety, under the government of a bishop, and that without any indication of there ever having been a time when it was otherwise. The existing bishop is usually spoken of as the successor of other bishops reaching in unbroken line to apostolic times. Episcopacy is everywhere uniformly established, and its claim to an unbroken descent from the apostles is everywhere asserted, and nowhere called in question.

In the words of Dr. Arnold, no prejudiced champion of Episcopacy,

> "The beginning of the 2d century found the church under the government of bishops, many of whom derived their appointment from the apostles themselves at only one or two removes,—that is to say, they had been chosen by men who had themselves been chosen by an apostle, or by persons such as Timotheus, in whom an apostle had entertained full confidence" (*Fragment on the Church*, p. 124).

Irenæus, writing at the close of the 2d century, argues for the apostolical purity of the faith of the Church of Rome from the unbroken chain by which it was connected with the apostles. "Linus was appointed by the apostles themselves; Anacletus succeeded Linus; Clemens, Anacletus; after whom followed in regular succession Euaristus, Alexander, Sixtus, Telesphorus, Hyginus, Pius, Anicetus, Soter, down to Eleutherius (the bishop of his own day), who holds the episcopal position twelfth in order from the apostles" (lib. iii. c. 3, § 3).

The challenge given by Tertullian, a little later, to the heretics of his day, to "produce the roll of their bishops running down in due succession from the beginning in such a manner that that first bishop of theirs shall be able to show for his ordainer or predecessor some one of the apostles, or of apostolic men" (*De Præscript.*, c. 31), is equally convincing. In the following paragraph, where, after referring to the appointment of Polycarp at Smyrna by St. John, and Clement at Rome by St. Peter, he proceeds—"This is the manner in which the apostolic church hand down their registers, and exhibit those whom, having been appointed to their episcopal seats by apostolic law."

Catalogues of the bishops of almost all the earlier churches are in existence. These may contain some doubtful names; but they may be accepted as satisfactory evidence of the belief, in the age nearest to that to which they refer, that, in the words of Hooker, "under them [the apostles], and by their appointment, this order began, which maketh many presbyters subject unto the regiment of some one bishop" (*Eccl. Polit.*, vii. 10).

Once established, the value, nay, the necessity, of the episcopal form of government secured its permanence. It was not only, as in its first beginnings may have been its chief object, a remedy against schisms, and a safeguard against heresies, but it was the outward symbol of the unity of the church, and one of the most effectual methods by which that unity was maintained. The individual bishop was the visible representative of the corporate life of the individuals making up a congregation. The maxim of St. Cyprian, "Ecclesia est in Episcopo" (Cyp., iv. *Ep.* 9), was universally recognized. "They were the representatives of the church, and without them the church had no existence; those were not the prayers of the church, that was not her communion which the bishop did not either preside at or sanction" (Arnold, *u.s.*, p. 124). The bishop was regarded as the channel of divine grace, the bond of Christian brotherhood. Episcopacy, moreover, was not only the bond tying all the members of a church into one body, but also that which united the scattered churches into one organic whole. The collective episcopate formed the system of "joints and bands" by which the body of the catholic church was knit together. This idea has been well expressed by the present bishop of Edinburgh, Dr. Cotterill—

> "The episcopal office was the means of the confederation of the church, whether in the several provinces or throughout the world. The office was not something isolated—the mere promotion of an individual to certain functions; it was and is the result and the means of church federation, connecting first of all each generation with that which preceded, and then each bishop with the episcopal body, and through it with the whole church, the functions of the office being exercised in union with other members of the federation, from whom mission is received, and in obedience to its laws, and not according to the mere will of the individual. From these considerations it is obvious that Episcopacy and organic unity are entirely of the same essence" (*Charge to the Synod of the Diocese of Edinburgh*, 1877).

The idea of Episcopacy thus set forth, as the unifying instrumentality in the church of Christ, is that which holds the prominent place in the estimate of the first Christian writer in whom we have any detailed reference to episcopal organization, St. Ignatius of Antioch. In his eyes the bishop represents the church, and is the centre of unity to the body, a safeguard against disunion, and a security for the maintenance of discipline and the harmonious co-operation of its various constituents. With Irenæus the idea of the bishop as the centre of unity undergoes some modification. Heresy was the church's danger in his day, as intestine strife had been its danger in Ignatius's time. The unity of which Irenæus, like his later contemporary Tertullian, regards Episcopacy as the safeguard and guarantee is the unity of the faith. The one undying episcopate, with its direct descent from the apostles, was the assurance of the permanence of apostolic truth. The bishop, as the successor of the apostles, was the depositary of primitive truth, the inheritor of apostolic tradition. "If you wish to ascertain the doctrine of the apostles, you must apply to the church of the apostles."

The views of the necessity of Episcopacy expressed by these early writers may seem to us sometimes overstrained, and their language exaggerated. But to them these exalted terms were most real. They were no more than the natural expression of their experience of the strength and safety derived from the organization which they most certainly believed to be the gift to the church of her Great Head. Whatever divergences of view there may be as to the origin and authority of Episcopacy, and of its general necessity, an unprejudiced survey of the early history of the church will show how important a part it played in the maintenance of its life and health, both in the promotion of organic unity and the preservation of purity of doctrine. "The constitution of the church is ordained of God; but it is ordained because it is adapted for man."

Once established in the chief centres of national life, the growth of Episcopacy was steady, and gradually covered the whole surface of Christendom with its ramifications. By degrees a systematic organization sprang up, by which neighboring churches were grouped together for the purposes of consultation and self-government. The chief city of each district had the civil rank of the "metropolis," or mother city. There the local synods naturally met, and the bishop—styled "metropolitan," from his position—took the lead in the deliberations, as "primus inter pares," and acted as the representative of his brother bishops in their intercourse with other churches. Thus, though all bishops were nominally equal, a superior dignity and authority came by general consent to be vested in the metropolitans, which, when the churches became established, received the stamp of ecclesiastical authority. A still higher dignity was assigned to the bishops of the chief seats of government, such as Rome, Antioch, Alexandria, and subsequently Constantinople; and among these the bishop of Rome naturally had the precedence. In primitive times each city had its own bishop, with a number of "chorepiscopi," or country bishops subordinate to him, to take the oversight of the smaller towns or villages of the district, as their deputies. Whether these "chorepiscopi" were universally of episcopal rank is an unsettled question. It is probable that no strict rule was observed on this point, and that, in accordance with the duties they were called to discharge, while some were bishops in the strict sense of the word, others had only received the orders of a presbyter.

Convenience dictated that the ecclesiastical divisions should generally follow the civil divisions of the empire. When Christianity became established under Constantine, and the church and state represented different functions of the body corporate, this rule was strictly followed out, in accordance with the new divisions of prefectures and dioceses introduced by him. The term "diocese" was used in a much more extensive sense than that to which it was afterwards restricted. The empire was divided into four prefectures:—1, the East; 2, Illyria; 3, Italy; 4, Gaul,—each comprising a varying number of dioceses, each diocese containing within itself several provinces. Thus Asia, one of the five dioceses of the prefecture of the East, included ten provinces, and Pontus seven. The provinces were in their turn subdivided into districts bearing the designation of *parœchiæ*, (παροικίαι), which answered to dioceses in the modern sense of the term. Each of these "parœchiæ" had its own bishop, who was subordinate to the metropolitan, who had his see in the capital of the province. These metropolitans were subject to the authority of the bishop of the chief city of the political diocese, who in the East was styled "exarch," in the West "primate." A higher dignity still was assigned to the chief bishops of the great cities of the empire, such as Rome, Constantinople, Antioch, and Alexandria. To these, with the addition of Jerusalem, the title of "patriarch," which had originally been common to all bishops, was more immediately but not exclusively restricted after the Council of Chalcedon, 451 A.D. In the West the title "patriarch" was employed with greater latitude for metropolitan bishops generally. Even so late as the 11th century we find the metropolitans of Aquileia and Grado so termed. (Mansi, xvii. 341; xviii. 465, 499.) The occupants of these primatial sees were also designated "archbishops." The term "œcumenical bishop" is sometimes found applied to the bishops of Rome, while that of "œcumenical patriarch" was assumed by the bishops of Constantinople, though more as a title of dignity than as implying any claims to universal authority. Theoretically all these primatial sees were co-ordinate in authority, and were mutually independent of one another. By degrees the bishops of the more important cities overshadowed their brethren, and exercised a supremacy which, though rather due to custom than to recognized claims, was increasingly acquiesced in from the manifest advantage of having a strong central power which could interfere in theological controversies or ecclesiastical disputes with an authority to which all would bow. The gradual growth of the supremacy of the bishop of Rome as the chief pastor in the Western Church, and the ecclesiastical head of the imperial city, will be the subject of a separate article.

The primitive rule was that, except in the case of coadjutor bishops, each diocese, in the modern sense, should have but one bishop, and that no bishop should have more than one diocese. Both rules were, however, in subsequent times violated. When the Arian controversy was dividing the Christian world, it was no uncommon occurrence for one see to have two or three rival bishops, all denouncing and excommunicating one another. At Antioch in the latter half of the 4th century there were two orthodox bishops, Paulinus and Meletius, recognized respectively by the Western and the Eastern church, an Arian bishop Euzoius, and a fourth of the Apollinarian sect. After the rise of the Novatian schism many cities had both an orthodox and a Novatian bishop. The vicious practice for one bishop to hold a second see "in commendam" was of gradual growth. Its origin was innocent. When a see was vacant and there was a difficulty about appointing a successor, its oversight was commended temporarily to a neighboring bishop. The same was the case when a bishop was suspended for crime, or when a diocese had been so devastated by the inroads of heathen that its Christian population was too small to demand the services of a separate overseer. But that which began in necessity was continued by covetousness, until it culminated in the flagrant abuse which reached its height just before the Reformation, when the revenues of several sees were accumulated on a single individual, who probably was equally careless of the spiritual interests of all. Thus Cardinal Wolsey was at the same time archbishop of York and bishop of Durham and Winchester, and enjoyed the wealthy see of Tournay in France.

The translation of a bishop from one see to another was forbidden by the canons of the primitive church. The only exception was where it was evident that the motive could not be increase of wealth or temporal aggrandizement, as when a bishop removed from a richer to a poorer see, or from an easier to a more laborious one; or when there was the prospect of spiritual advantage to the church. Though many instances of translation are found in early times, they are usually exceptional cases, and it may be safely asserted that until the growth of secularity and covetousness in the hierarchy had made rich sees an object of eager competition among prelates, the practice was universally condemned as an act parallel to divorce, only to be justified by the plea of necessity or benefit to the church.

It is unnecessary to trace the episcopate in the various churches in communion with the see of Rome. With hardly any, if any exceptions, the succession of bishops reaches in an unbroken line to the earliest ages of Christianity. This is also true of the churches of the orthodox communion in the East. Their episcopal pedigree exhibits few if any gaps, and the integrity of the record is usually beyond question.

It will be a more important task to examine the history of the episcopate in those countries of Europe which retained that form of church government after renouncing the papal authority, as well as in America and the dependencies of Great Britain, with the view of testing its claims in each instance to what is known as "apostolical succession," *i.e.*, an uninterrupted line of episcopally consecrated prelates reaching up to the first ages of the church.

In England the primitive church, by whomsoever founded (the Eastern theory is certainly baseless), was undoubtedly Episcopal. The names of three British bishops, those of York, London, and Caerleon,[1] are found among those who attended the Council of Arles in 314. With the ancient British church, however, the later Episcopacy of England has no connection. The existing Church of England is the lineal descendant of that planted in Kent by St. Augustine at the end of the 6th century. The descent of her bishops is traced continuously by one of the most honest and accurate of her living historians, Professor Stubbs, in his *Episcopal Succession in England.* The separation from the see of Rome caused no breach in the continuity. Archbishop Parker, from whom the present Episcopacy descends, was consecrated December 17, 1559, by Bishop Barlow of Chichester (himself consecrated by Archbishop Cranmer June 11, 1536), Scory of Hereford, Coverdale of Exeter, and Hodgkins of Bedford. The ridiculous "Nag's Head Fable," by which some unscrupulous partisans have endeavored to discredit the Anglican succession, was long since repudiated by the Roman Catholic historian Dr. Lingard, and is now universally regarded with the contempt it deserves.[1] See ENGLAND, CHURCH OF, p. 332 of the present volume.

---

[1] The latest and most trustworthy authority, the lamented Mr. A. W. Haddan, decides against the claim of Lincoln as the see of the third bishop.

The episcopate of the Church of Scotland was at its commencement rather missionary than diocesan. The first bishops, St. Ninian (died 432), St. Palladius (died *c.* 435), and St. Serf and St. Ternan, the disciples of the latter, were missionaries among a heathen population, with no defined dioceses. Each had his centre of operations in a monastic establishment of which he had been founder,—St. Ninian at Candida Casa, *i.e.*, Whithorn in Galloway, St. Palladius at Fordun in the Mearns, St. Serf at Culross, St. Ternan probably at Upper Banchory—but it would be an anticipation of a later organization to speak of these places as in any sense their episcopal sees. The first diocese of which we have any knowledge was that founded by St. Kentigern (died 612), which embraced the field of labor of St. Ninian, and revived his decayed but scarcely extinct church. At one time St. Kentigern fixed his see at Hoddam in Dumfriesshire, but it eventually became established at Glasgow. The missionary character of his episcopate is evident from the enormous size of his diocese. This, coextensive with the kingdom of Rydderch, king of Strathclyde, stretched from the Clyde to the Mersey, and in breadth probably reached from sea to sea. In 729 Galloway was severed from it and became a separate diocese, with its see at Candida Casa, Pecthelm, a deacon of Aldhelm of Sherborne, and a friend of Bede, being the first bishop. The Anglian succession of bishops at Candida Casa lasted till the beginning of the 9th century, when the ravages of the Northmen and the generally disturbed state of the country put an end to it. In Celtic Scotland, to the north of the Clyde, Episcopacy had still less of a diocesan character. In the Celtic church, among the "Scoti" both of Ireland and Scotland, the organization was distinctly monastic, not episcopal. The chief government of the church was vested in the abbots of the principal monasteries, to whom the bishops, necessary for the perpetuation of the ministry, were subordinate. In fact, in Celtic Scotland diocesan Episcopacy was non-existent, and the church was under the government of the primatial presbyter-abbot of Iona. The bishops residing in that and other monasteries, though superior to their abbots in ecclesiastical order, were their inferiors in official rank, and were subject to their primatial authority. Nor had these bishops any territorial jurisdiction. "An episcopal succession," writes Mr. Grub, "was kept up, but it was not in connection with any fixed seat or territory; it was a succession of order alone, not of jurisdiction. There was no diocesan Episcopacy, properly speaking,—no episcopal rule at all. Each abbot was the head of his own monastery, and over all was the successor of St. Columba, the primate of the Picts and Scots" (*Eccles. Hist. of Scotland,* vol. i. p. 139). On the union of the Picts and Scots under one sovereign, the centre of ecclesiastical authority was transferred, together with the relics of St. Columba, from Iona to Dunkeld by Kenneth MacAlpine in 849, and again to St. Andrews about 906. The bishop of St. Andrews continued the only diocesan prelate, as bishop of the Scots, till the reign of Alexander I., when, before 1115, the sees of Moray and Dunkeld were founded. About the same time, the Cumbrian see of Glasgow, which had become extinct during a long period of semi-barbarism, the result of perpetual invasions, was revived by David earl of Cumbria, in the person of John, consecrated at Rome by Pope Paschal II., probably in 1117. It was also under David, after his accession to the Scottish crown, 1129, that the episcopate received its most marked extension in the foundation of the sees of Aberdeen, Ross, Caithness, Brechin, and Dunblane, and the restoration of that of Candida Casa, in Galloway. The date of the foundation of the see of Argyll is doubtful. It has been placed not improbably *c.* 1200. The claims of the archbishops of York to the primacy of Scotland, at no time very well grounded nor willingly allowed, were the source of continual dissensions; and in 1188, William king of the Scots obtained a bull from Pope Clement III. declaring the independence of the Scotch Church and its bishops of any see but that of Rome. Three centuries, however, elapsed before Scotland secured a metropolitan of her own, after several ineffectual attempts to obtain the pall. In 1472 St. Andrews was erected into an archiepiscopal and metropolitan see; and a few years later, 1489, Glasgow also attained the same rank. The episcopate having been thus completely organized, the succession continued unbroken till the Reformation of the 16th century, when the canonical prelates were generally superseded. Protestant bishops were, however, continued after a fashion, 1571–1574, although the canonical validity of their consecration was in most cases exceedingly questionable, it being very doubtful whether the consecrators themselves had been consecrated, and even whether some of the new bishops had been episcopally ordained. "The thirteen dioceses of the ancient church continued in 1578 to exist in name, and most of them were filled by Protestant ministers bearing the style of bishops, although hardly one of them ventured to exercise episcopal jurisdiction," (Grub, *Eccl. Hist. of Scotland,* ii. p. 203). This shadow of the episcopate speedily received a fatal blow. Titular Episcopacy was declared abolished in 1581 by royal proclamation; and though the base covetousness of some of the leading nobles prolonged its nominal existence for a while in the scandalous system of "tulchan bishops," by which men were appointed to sees on the express understanding that their emoluments, with the exception of a small pension, should be transferred to the lay patron, it became virtually extinct. On the accession of James VI. to the English throne, Episcopacy was again for a short time revived in Scotland. The succession was obtained from England, and the archbishop of Glasgow, and the bishops of Brechin and Galloway, were consecrated in the chapel of London House, October 21, 1610. The renewed overthrow of Episcopacy, and the establishment of Presbyterianism during the Great Rebellion of the 17th century, belong to general history, and need not be entered on here. On the restoration of Charles II. an unsuccessful attempt was made to re-establish the episcopal form of government. By this time all the bishops who derived their succession from those consecrated in 1610 had passed away, with two exceptions; and it was resolved to obtain, a second time, the canonical succession from the English Church. On the 15th of December, 1661, Sharp, Fairfoul, Hamilton, and Leighton were consecrated in Westminster Abbey to the archiepiscopal sees of St. Andrews and Glasgow, and the bishoprics of Galloway and Dunblane, respectively. On the return of these prelates to Scotland, they lost no time in consecrating bishops for the other vacant sees. Thus the Scottish episcopate was restored to its full complement of two archbishoprics, and twelve bishoprics—Aberdeen, Argyll, Brechin, Caithness, Dunblane, Dunkeld, Edinburgh, Galloway, the Isles, Moray, Orkney, and Ross. It would be beside the purpose of this article to enter into the causes of the failure of this fresh attempt to establish prelacy in Scotland, or to narrate the political events which led to the renewed abolition of this form of church government and the establishment of Presbyterianism as the national religion of Scotland, or to speak of the civil disabilities under which the Episcopal Church labored till the passing of the Act of Toleration in 1711, and, after the fresh calamities resulting from the part taken by the bishops and episcopal clergy in the Rebellion of 1745, by the Relief Bill of 1792. The condition of the Episcopal Church was for a long time so depressed that no attempt was made to keep up a regular system of diocesan government. Two bishops without diocesan jurisdiction, Sage and Fullarton, were privately consecrated in 1705 at Edinburgh; and two more, Falconer and Christie, in 1709 at Dundee. Other similar consecrations followed, but after a period of considerable controversy between the advocates of diocesan Episcopacy and the government of the church by a college of bishops "at large," the former system was accepted by the members of their communion, and is that under which the Episcopal Church in Scotland is now administered. The existing territorial divisions, each with its bishop, are (1) Aberdeen, (2) Argyll and the Isles, (3) Brechin, (4) Edinburgh, (5) Glasgow and Galloway, (6) Moray, Ross, and Caithness, (7) St. Andrews, Dunkeld, and Dunblane. The bishops are appointed by the votes of their presbyters, and are all equal in jurisdiction, one of their body being chosen by themselves as "primus," for the purpose of convoking and presiding over the meetings of the episcopal college. This system is about to give place to that prevailing in the Episcopal Church from primitive times, by the appointment of a metropolitan. The most remarkable event in the history of the Scotch Episcopal Church in modern times has been the gift of the episcopal succession to the Church of America, by the consecration of Dr. Samuel Seabury as bishop of Connecticut by the Scotch bishops at Aberdeen, August 31, 1784.

---

[1] The fullest account of Archbishop Parker's own consecration and that of his consecrators will be found in the *Ordinum Sacrorum in Ecclesia Anglicana Defensio,* by the Rev. T. J. Bailey, which contains Photo-zincographic copies of the actual documents relating to the transaction.

In Ireland, Episcopacy appears to have been coeval with the introduction of the Christian faith. Before the apostolic labors of St. Patrick, 430–491 A.D., and the brief mission of St. Palladius by Pope Celestinus, *c.* 431, there were bishops in Ireland whose names are recorded by Ussher. The church planted by St. Patrick, though episcopal, had no diocesan organization. As in the daughter Church of Scotland, the ecclesiastical system was monastic and collegiate, not diocesan or parochial. The bishops had neither local jurisdiction nor regulative authority, and seem to have existed simply for the purpose of ordination, which was held to be their exclusive right. As at Iona, the Irish bishops were subordinate to the heads of the monastic establishments to which they belonged, and that even when that position was held by a female. At Kildare the bishop was the nominee and functionary of the abbess St. Bridget and her successors. There being no limitation to the number of bishops, the order became multiplied far beyond the utmost needs of the Irish Church, until there were almost as many bishops as congregations. Having no sufficient employment at home, they wandered into other countries, where by their irregular performance of their episcopal functions great disorders were introduced, against which several of the canons of the church councils of the 9th century were directed. Their ordinations were declared null and void at the Council of Chalons in 813, and a still more stringent rule was passed at that of Calcuith, 816, forbidding any of the race of the "Scoti" to celebrate the sacraments or minister in any of the offices of the church. The Church of Ireland retained its complete independence as a national church, free from the jurisdiction or authority of Rome, till the early part of the 12th century. The archbishop of Armagh was the sole primate, and by him all the bishops were consecrated. The first introduction of Roman influence was due to the predatory Danes, or "Ostmen," who had established themselves on various spots of the seaboard. On their conversion to Christianity they were naturally led to seek their chief pastors, not from the native church of the country they had invaded, but from their own Norman kindred in England. "It was to the archbishops of Canterbury, Lanfranc and Anselm, that the bishops of the Danish cities—Limerick, Waterford, and Dublin—repaired for consecration, and made profession of canonical obedience; and these bishops, though sometimes of Irish birth, were generally persons who had been trained in English monasteries" (Robertson, *Hist. of Christian Church*, v. 264). This connection with the Roman see through the English Church, though at first limited to the Danish settlers, was gradually extended and strengthened, until in 1118 we find Gilbert bishop of Limerick presiding over a synod as papal legate, and using his influence to bring the Irish Church into conformity with Roman customs. One beneficial result of this intercourse with Rome was that Ireland was partitioned out into territorial dioceses, with bishops possessing local jurisdiction. A second primatial see was also established at Cashel, to which those of Dublin and Tuam were afterwards added. The loss of the ancient independence of the Irish Church was sealed when the grant of the palls for which St. Malachy, the strenuous advocate for complete conformity to the Latin Church, had so earnestly pleaded in his visits to Rome, 1137–1140, was unanimously solicited of the pope by the national synod held at Holmepatrick in 1148, and accepted at the hands of the cardinal legate by the Irish metropolitan at the synod of Kells in 1152. The conquest of Ireland by Henry II. of England, to whom it had been granted by Pope Hadrian IV., as "the head owner of all Christian islands," completed the subjection. A council convened by him at Cashel in 1172 decreed that the Church of Ireland should be reduced to the form of that of England; and Ireland was, chiefly through the influence of English ecclesiastics who were put into the highest dignities of the church, gradually brought into the same conformity to the Church of Rome as the other countries of the West. With the view, however, of counteracting the growing encroachments of the papacy, it became customary for the Irish bishops, after election by their own chapters, to receive consecration in England, in order that they might renounce in person all claims prejudicial to the English crown made by the Church of Rome. The state of the Church of Ireland during the Middle Ages was one of fierce intestine discord. Its episcopal succession, however, continued unbroken. Nor did the Reformation cause any breach in its continuity. The Irish parliament in 1536 cast off the papal supremacy and accepted that of the crown. The bishops acquiesced in the change, and at the accession of Elizabeth in 1560 all save two, appointed by Queen Mary, took the oath of supremacy to the queen and conformed to the reformed liturgy. The line was preserved during the storm of the Great Rebellion; at the Restoration eight of the Irish bishops were still surviving. Of these Bramhall was selected for the primacy, and by him and his suffragans two archbishops and ten bishops were consecrated to the vacant sees in St. Patrick's, Dublin, in 1661. The churches of England and Ireland were united by Act of Parliament in 1800. In 1833–34 the episcopate was much curtailed. Two of the archbishoprics were reduced to bishoprics, and ten of the bishoprics were merged in other sees. Finally, in 1869, the Irish Church was disestablished, and became, like the Episcopal Church of Scotland, an episcopal church existing in the country, not the established church of the country. Through all these changes the episcopal succession has remained unimpaired, and the Protestant episcopate can claim to be regarded as the lineal representative of the ancient episcopate of Ireland. The Roman Catholic bishops in Ireland derive their consecration from foreign churches,—those of Spain, Portugal, and Italy,—and therefore have no direct connection with the national Irish Church.

The churches of Scandinavia, including those of Sweden, Norway, Denmark, and Iceland, were the only Christian bodies which embraced the Lutheran doctrines that preserved an episcopate through the stormy period of the Reformation. Of these, the Church of Sweden alone can put forth a claim to an unbroken succession, nor is this claim quite beyond question. The Scandinavian churches, with their bishops, were originally subject to the see of Hamburg or Bremen, of which their founder, the apostolic Anschar of Corbey (who died 865), was the first occupant. In 1104 Lund in Schonen was chosen as the seat of a new archiepiscopal see, to which all the Scandinavian kingdoms and dependencies should owe allegiance. The other kingdoms being displeased at their subjection to a Danish prelate, a synod was held at Skenning in 1248, under the presidency of the English cardinal, Nicholas Breakspear, afterwards Hadrian IV., which gave a primate to Norway, the islands, and Greenland, placed at Nidarós (Drontheim), and provided for the erection of a primacy of Sweden, afterwards fixed in 1164 at Upsala. The episcopal system being thus established, the succession was continued in the Scandinavian churches till the Reformation, when it was completely interrupted everywhere save in Sweden. During that period of disturbance all the Swedish sees became vacant but two, and the bishops of these two soon left the kingdom. The episcopate, however, was preserved by Peter Magnusson, who, when residing as warden of the Swedish hospital of St. Bridget in Rome, had been duly elected bishop of the see of Westeraes, and consecrated *c.* 1524. No official record of his consecration can be discovered, but there is no sufficient reason to doubt the fact; and it is certain that during his lifetime he was acknowledged as a canonical bishop both by Roman Catholics and by Protestants. In 1528 Magnusson consecrated bishops to fill the vacant sees, and, assisted by one of these, Magnus Sommar, bishop of Strengness, he afterwards consecrated the Reformer, Lawrence Peterson, as archbishop of Upsala, Sept. 22, 1531. Some doubt has been raised as to the validity of the consecration of Peterson's successor, also named Lawrence Peterson, in 1575, from the insufficiency of the documentary evidence of the consecration of his consecrator, Paul Justin, bishop of Abo. The integrity of the succession has, however, been accepted after searching investigation by men of such learning as Grabe and Routh, and has been formally recognized by the convention of the American Episcopal Church. The number of dioceses in Sweden is now twelve, including the archiepiscopal see of Upsala, by the holder of which the bishops are, as a rule, consecrated. On a vacancy three candidates are nominated by the votes of the clergy of the diocese, of whom one is selected by the king. The succession to the daughter church of Finland, now independent, stands or falls with that of Sweden.[1]

The other Scandinavian churches—those of Denmark, Norway, and Iceland,—though equally episcopal in form, cannot produce any legitimate claim to the episcopal succession. The Reformation was at first opposed by the whole episcopate. For this and other political charges, the king, Christian III., in 1536–37 suddenly placed most of the bishops under arrest, and compelled them to resign their sees into his hands, to dispose of as he thought good. On their engaging not to oppose the Reformation they were indisposed to lead, these prelates were presented by him to stalls in cathedral or collegiate churches, and, quietly acquiescing in the new *régime*, created no schism from the national establishment. They did not, however, take any part in the consecration of their successors, which was performed by Bugenhagen, Luther's friend and fellow-laborer, at Copenhagen, September 2, 1537. The seven ministers on whom Bugenhagen laid hands were called evangelical superintendents, or bishops, and from these the existing succession is derived. Bugenhagen drew up, by the king's command, a scheme of church government for Denmark and Norway. In the latter kingdom the pre-Reformation bishops generally deserted their posts; two, Hans Reff of Opslœ and Geble Pedersen of Bergen, adopted the change and retained their sees. In Iceland the last of the Roman Catholic bishops authorized the first Protestant bishop, ordained at Roeskild, to hold his office in succession to himself. It will be seen that the validity of the episcopal succession in these churches is very questionable. But it has never been formally denied by the Church of England, and it has been accepted by Dodwell, Leslie, and Thorndike, and its orders have been recognized by the Indian bishops in the case of missionaries ordained by the Danish Church.

Another Protestant episcopal church is that of the Moravians, or, as they prefer to style themselves, the *Unitas Fratrum*. The Bohemian anti-Reformation swept the church of the Brethren from their original seat to find a refuge in Poland and Prussia. Here their ancient Episcopacy, derived in 1467 from the Austrian Waldenses, was perpetuated in regular succession, until in 1735 one of the two last surviving bishops, Jablonski, with the concurrence of the other, Sitkovius, consecrated David Nitschmann to be the first bishop of the renewed church of the Brethren, established at Herrnhut in Saxony. Two years later, May 20, 1737, Jablonski and Nitschmann consecrated Count Zinzendorf as the second bishop of the Moravian church. From these two the existing Moravian episcopate is derived.

A remarkable instance of a Roman Catholic episcopal church not in communion with the papal see is to be found in the so-called Jansenist Church of Holland. Preserved with difficulty through the tempestuous period of the Dutch Reformation, when after fierce struggle the Protestant faith obtained the ascendency it has ever since maintained in Holland, the episcopate was in danger of dying out at the beginning of the 18th century through the refusal of the papal authorities to allow consecrations to the vacant sees, in revenge for the resolute adherence of the church to Jansenist doctrines. The episcopate was indeed only saved from extinction by the singularly opportune presence of a duly consecrated bishop of Babylon (Dominique Marie Varlet, previously vicar-general of Louisiana), who, having been suspended unheard by a notoriously uncanonical sentence, in consequence of his having manifested sympathy with the oppressed church of Holland, by administering the rite of confirmation during his sojourn at Amsterdam on his outward journey, had made that city his home, on his return to Europe in 1721, while waiting the result of his appeal. Convinced that they had no hope of obtaining a prelate from the papal court, the chapter of Utrecht met and elected Cornelius Steenoven archbishop, April 27, 1723. More than a year having been spent in vain applications to neighboring diocesan bishops to perform the ceremony, the newly-elected prelate was consecrated by the bishop of Babylon at Amsterdam, October 15, 1724. The act was declared unlawful and execrable by Pope Benedict XIII., and all who had taken part in it were excommunicated. The national church maintained a firm attitude, and on the death of the new archbishop, within half a year of his consecration, the chapter proceeded to the immediate election of a successor, Barchman Waytiers, who was also consecrated by the bishop of Babylon, September 30, 1725. On the death of Waytiers, May 13, 1733, before he could succeed in securing the consecration of any suffragan, Theodore van Croon was elected by the chapter, and received consecration from the same hands, October 28 of that year. Once again, and for the last time, on the death of this archbishop, June 9, 1739, the bishop of Babylon was called upon to save the Dutch episcopate from extinction by the consecration of Peter John Meindaerts, October 18, 1739. The chapter of Haarlem, whose unwillingness to offend the papal authorities by electing a bishop had hitherto prevented the increase of the episcopate, still refusing to act, the new archbishop took the matter into his own hands, nominated and consecrated a bishop to that see in 1742, and added a third member to the episcopal college in the person of the bishop of Deventer, consecrated in 1758. The succession has continued unbroken from that time to the present day, though in more than one instance its existence has hung precariously on a single life. Each consecration has been followed by a formal excommunication by the pope, and, all the attempts to obtain reconciliation being repelled with insult, the church has at length settled down into the true Gallican position of protest against ultramontanism whether of doctrine or of discipline. (A. W. Haddan's *Remains*, p. 413; Neale's *Jansenist Church of Holland.*)

The national Church of Holland has been the instrument of conferring the episcopate on the community known as "Old Catholics," whose separation from the Church of Rome, under the leadership of Dr. Döllinger, was occasioned by the publication of the Vatican decrees relating to papal supremacy and infallibility, passed at the so-called œcumenical council of 1870. Dr. J. H. Reinkens, the individual chosen to be the first bishop of the new church at the synod, consisting of priests and lay delegates, held at Cologne, June 4, 1873, was consecrated on August 11 by Mgr. Heykamp, the bishop of Deventer,—Archbishop Loos of Utrecht, who had promised to administer the rite, having died on the very day of the new bishop's election. A second bishop, Edward Herzog, was consecrated for the members of the old Catholic body in Switzerland by Bishop Reinkens at Rheinfelden in Aargau, September 18, 1876, having been previously elected by a synod assembled at Olten.

The episcopate in the colonies and dependencies of the English crown commenced with the consecration of Dr. Charles Inglis to the diocese of Nova Scotia, which took place at Lambeth, August 12, 1787, the same year which had witnessed the foundation of the episcopate of the American Church. Quebec was formed into a separate diocese in 1793, and Nova Scotia was again subdivided by the foundation of the sees of Newfoundland in 1839, and Fredericton (New Brunswick) in 1845. The original diocese of Quebec has also been broken up by the establishment of the sees of Toronto (1839), Montreal (1850), Huron (1857), Ontario (1861), and Niagara (1875). These are all suffragans to Montreal, the metropolitical see of the Dominion of Canada. In 1849 the diocese of Rupert's Land was formed out of the vast territories of the Hudson's Bay Company. This has subsequently been constituted metropolitical, having as its suffragans the bishops of Moosonee (1872), Athabasca (1874), Saskatchewan (1874), and the missionary bishop of Algoma (1873).

The next part of the British dependencies to receive the episcopate was the East Indies. The see of Calcutta was formed, to which Dr. Middleton was consecrated at Lambeth in 1814. The unwieldy diocese intrusted to his supervision, including eventually all British subjects in India, Ceylon, Mauritius, Australia, New Zealand, and Tasmania, has been gradually broken up into more than twenty separate dioceses, and the process of subdivision is continually going on.

---

[1] The whole subject of the Swedish episcopate and the validity of its succession will be found discussed in a series of papers—from which our information is chiefly drawn—characterized by fairness and thoroughness of investigation, by the Rev. F. S. May, in the *Colonial Church Chronicle* for 1861. We are also indebted to Mr. May for a clear statement of the history of the episcopate in the other Scandinavian churches, in papers read before the Church Congresses at Norwich and Southampton.

India alone now remains under the metropolitan of Calcutta, who has as his suffragans the bishops of Madras (1835), Bombay (1837), Colombo (Ceylon) (1845), Labuan (1855), Lahore (1878), and Rangoon (1878). The diocese of Victoria (Hong Kong) was established in 1849, that of the Mauritius in 1854, and of North China in 1872.

The West India islands came first under episcopal supervision in 1824, when the dioceses of Barbados and Jamaica (now Kingston) were founded. In 1842 the diocese of Barbados was divided into three by the formation of the separate sees of Antigua and Guiana, and in 1861 the Bahamas were severed from Jamaica and became the see of Nassau. The bishopric of Trinidad was founded in 1872.

In 1836 Australia and the adjacent English dependencies were withdrawn from the nominal supervision of the bishops of Calcutta by the consecration of Dr. W. G. Broughton as first bishop of Australia (now Sydney). New Zealand was erected into a separate see (now Auckland) in 1841, and Tasmania in 1842. The see of Sydney has since become metropolitical, containing the dioceses of Adelaide, Melbourne, Newcastle (all three founded in 1847), Perth (1857), Brisbane (1859), Goulburn (1863), Grafton and Armidale (1867), Bathurst (1869), and Ballarat (1875). The original diocese of New Zealand is now divided into six under its own metropolitan, the primacy being elective and not attached to any specified see. These dioceses are Auckland (1869), Christchurch (1856), Wellington, Nelson, and Waiapu (all three founded in 1858), and Dunedin (1866). To these should be added the missionary bishopric of Melanesia (1861). The Polynesian island of Hawaii became the seat of the bishop of Honolulu in 1861, the Falkland Islands were constituted a see in 1870, and after many difficulties Madagascar received the episcopate in 1874.

After the colony of the Cape of Good Hope had been in British possession for more than forty years, the episcopate was granted to it. Bishop Gray was consecrated first bishop of Cape Town on St. Peter's Day, 1847. This energetic prelate lost no time in subdividing his enormous diocese. The first new sees were those of Graham's Town and Natal, founded in 1853. St. Helena became a bishopric in 1859, the Orange River Territory (now Bloemfontein) in 1863, Maritzburg in 1869, Zululand in 1870, and Pretoria (the Transvaal) in 1878. The diocese of Independent Kaffraria (St. John's) was founded by the Scotch Episcopal Church in 1873. We must not omit to mention the missionary bishopric of Central Africa, or the Zambesi, founded by the Universities Mission in 1861, of which the lamented Charles Mackenzie was the first bishop.

On the western coast of Africa, Sierra Leone was constituted a diocese in 1850. In 1864 the Niger territory, including Lagos and Abbeokuta, was taken from it as a missionary diocese. On the seaboard between the two, the republic of Liberia is ecclesiastically subject to a bishop of the American church stationed at Cape Palmas.

In 1842, Gibraltar was made the seat of a bishop, whose jurisdiction extends over the clergy and members of the Church of England on the seaboard and islands of the Mediterranean, Archipelago, and Black Sea. In 1846 a bishop was consecrated, under the title of bishop of Jerusalem, to take oversight of the Protestant settlements in Asia Minor, Egypt, Palestine, and Syria.

The episcopate of the Protestant Episcopal Church of the United States of North America was originally derived partly from the Episcopal Church of Scotland, partly from that of England. As, however, the Scottish bishops trace their succession to those consecrated by English bishops in 1661, the American Church may be regarded as a legitimate daughter of the Anglican Church, with which she is united in doctrine and discipline, and in legally authorized communion. The first bishop of the American Church was Dr. Samuel Seabury, elected by the clergy of Connecticut. The oath of allegiance, with which the archbishop had no power to dispense without a special Act of Parliament, forming an insuperable obstacle to his consecration in England, Dr. Seabury had recourse to the Scotch Episcopal Church, and was admitted to the episcopate at Aberdeen, November 14, 1784, by the hands of the bishops of Aberdeen, Ross, and Moray. Three years later the formal difficulty having been in the mean time removed, Dr. White and Dr. Provoost, the elected respectively of the conventions of Pennsylvania and New York, were consecrated at Lambeth on February 4, 1787, by Archbishops Moore and Markham and Bishops Moss of Bath and Wells and Hinchcliffe of Peterborough. There being now three bishops in the American Church, the number held canonically necessary under ordinary circumstances to a rightful consecration, though not absolutely essential to its validity, they proceeded to consecrate others, the first being Dr. Madison for Virginia. By the beginning of the new century the number of diocesan bishops had risen to seven, and now (1878) it amounts to fifty-seven, to whom must be added several missionary bishops consecrated for work among the heathen. The right of electing a bishop is vested, by the constitution of the American Church, in the convention of the diocese, lay as well as clerical. Their choice is submitted to the general convention, if sitting, if not, to the standing committees of the dioceses, and must receive the sanction of the majority before the bishops can consecrate. (E. V.)

EPISCOPIUS, Simon (1583–1643), a distinguished theologian (whose name in Dutch was Bisschop), was born at Amsterdam on the first January, 1583. In 1600 he entered the university of Leyden, where he took his master of arts degree in 1606. He afterwards studied theology under Arminius, and Arminius's opponent, Gomar; but soon becoming a strong sympathizer with the Arminian doctrines, he, on the death of Arminius in 1609, left Leyden for the university of Franeker. In 1610, the year in which the Arminians presented the famous Remonstrance to the States of Holland, he was ordained minister at Bleyswich, a small village in the neighborhood of Rotterdam; and in the following year he advocated the cause of the Remonstrants at the Hague conference. In 1612 he succeeded Gomar as professor of theology at Leyden, an appointment which awakened the bitter enmity of the Calvinists, and, on account of the influence lent by it to the spread of Arminian opinions, was doubtless an ultimate cause of the meeting of the Synod of Dort in 1618. Episcopius was chosen as the spokesman of the thirteen representatives of the Remonstrants before the synod; but he was refused a hearing, and the Remonstrant doctrines were condemned without any explanation or defence of them being permitted. At the end of the synod's sittings in 1619, Episcopius and the other representatives were deprived of their offices and expelled from the country. Episcopius retired to Brabant, but ultimately went to France, and took up his residence at Rouen. He devoted the most of his time to the promotion by writings of the Arminian cause; but the attempt of Wadding to win him over to the Romish faith involved him also in a controversy with that famous Jesuit. After the death of the stadtholder Maurice, the violence of the Arminian controversy began to abate, and Episcopius was permitted in 1626 to resume his duties in the Remonstrant church of Rotterdam. He was afterwards appointed rector of the Remonstrant college at Amsterdam, where he died in 1643. Episcopius may be regarded as in great part the theological founder of Arminianism. Its principles were enunciated by Arminius, but in a fragmentary and somewhat tentative shape, and it is to Episcopius that the merit is due of having developed them into a complete and distinctive form of belief, and of having given them a widely extended and permanent influence. Besides opposing at all points the peculiar doctrines of Calvinism, Episcopius protested against the tendency of Calvinists to lay so much stress on abstract dogma, and argued that Christianity was practical rather than theoretical,—not so much a system of intellectual belief as a moral power,—and that an orthodox faith did not necessarily imply the knowledge of and assent to a system of doctrine which included the whole range of Christian truth, but only the knowledge and acceptance of so much of Christianity as was necessary to effect a real change on the heart and life.

The principal works of Episcopius are his *Confessio s. declaratio sententiæ pastorum qui in fœderato Belgio Remonstrantes vocantur super præcipuis articulis religionis Christianæ* (1621), his *Apologia pro Confessione* (1629), and his uncompleted work *Institutiones Theologicæ*. A life of Episcopius was written by Limborch, and one was also prefixed by his successor, Curcellæus, to an edition of his collected works published in 2 vols. (1650–1665).

EPITAPH (ἐπιτάφιος, sc. λόγος, from ἐπί, upon, and τάφος, a tomb) means strictly an inscription upon a tomb, though by a natural extension of usage the name is applied to anything written ostensibly for that purpose whether actually inscribed upon a tomb or not. Many of the best known epitaphs, both ancient and modern, are merely literary memorials, and find no place on sepulchral monuments. Sometimes the intention of the writer to have his production placed upon the grave of the person he has commemorated may have been frustrated, sometimes it may never have existed; what he has written is still entitled to be called an epitaph if it be suitable for the purpose, whether the purpose has been carried out or not. The most obvious external condition that suitability for mural inscription imposes is one of rigid limitation as to length. An epitaph cannot in the nature of things extend to the proportions that may be required in an elegy.

The desire to perpetuate the memory of the dead being natural to man, the practice of placing epitaphs upon their graves has been common among all nations and in all ages. And the similarity, amounting sometimes almost to identity, of thought and expression that often exists between epitaphs written more than two thousand years ago and epitaphs written only yesterday is as striking an evidence as literature affords of the close kinship of human nature under the most varying conditions where the same primary elemental feelings are stirred. The grief and hope of the Roman mother as expressed in the touching lines—

Lagge fili bene quiescas
Mater tua rogat te,
Ut me ad te recipias:
Vale!

find their echo in similar inscriptions in many a modern cemetery.

Probably the earliest epitaphial inscriptions that have come down to us are those of the ancient Egyptians, written, as their mode of sepulture necessitated, upon the sarcophagi and coffins. Those that have been deciphered are all very much in the same form, commencing with a prayer to a deity, generally Osiris or Anubis, on behalf of the deceased, whose name, descent, and office are usually specified. There is, however, no attempt to delineate individual character, and the feelings of the survivors are not expressed otherwise than in the fact of a prayer being offered. Ancient Greek epitaphs, unlike the Egyptian, are of great literary interest, deep and often tender in feeling, rich and varied in expression, and generally epigrammatic in form. They are written usually in elegiac verse, though many of the later epitaphs are in prose. Among the gems of the Greek anthology familiar to English readers through translations are the epitaphs upon those who had fallen in battle. There are several ascribed to Simonides on the heroes of Thermopylæ, of which the most celebrated is the epigram—

"Go tell the Spartans, thou that passest by,
That here, obedient to their laws, we lie."

A hymn of Simonides on the same subject contains some lines of great beauty, which may be regarded as a literary epitaph:—

"In dark Thermopylæ they lie;
Oh death of glory, there to die!
Their tomb an altar is, their name
A mighty heritage of fame;
Their dirge is triumph.—Cankering rust,
And time that turneth all to dust,
That tomb shall never waste nor hide,—
The tomb of warriors true and tried.
The full-voiced praise of Greece around
Lies buried in that sacred mound;
Where Sparta's king, Leonidas,
In death eternal glory has."

In Lacedæmonia epitaphs were inscribed only upon the graves of those who had been especially distinguished in war; in Athens they were applied more indiscriminately. They generally contained the name, the descent, the demise, and some account of the life of the person commemorated. It must be remembered, however, that many of the so-called Greek epitaphs are merely literary memorials not intended for monumental inscription, and that in these freer scope is naturally given to general reflections, while less attention is paid to biographical details. Many of them, even some of the monumental, do not contain any personal name, as in the one ascribed to Plato:—

"I am a shipwrecked sailor's tomb; a peasant's there doth stand:
Thus the same world of Hades lies beneath both sea and land."

Others again are so entirely of the nature of general reflections upon death that they contain no indication of the particular case that called them forth. It may be questioned, indeed, whether several of this character quoted in ordinary collections are epitaphs at all, in the sense of being intended for a particular occasion.

Roman epitaphs, in contrast to those of the Greeks, contained, as a rule, nothing beyond a record of facts. The inscriptions on the urns, of which numerous specimens are to be found in the British Museum, present but little variation. The letters D.M. or D.M.S. (*Diis Manibus* or *Diis Manibus Sacrum*) are followed by the name of the person whose ashes are inclosed, his age at death, and sometimes one or two other particulars. The inscription closes with the name of the person who caused the urn to be made, and his relationship to the deceased. It is a curious illustration of the survival of traces of an old faith after it has been formally discarded to find that the letters D.M. are not uncommon on the Christian inscriptions in the catacombs. It has been suggested that in this case they mean *Deo Maximo* and not *Diis Manibus*, but the explanation would be quite untenable, even if there were not many other undeniable instances of the survival of pagan superstitions in the thought and life of the early Christians. In these very catacomb inscriptions there are many illustrations to be found, apart from the use of the letters D.M., of the union of heathen with Christian sentiment (see Maitland's *Church in the Catacombs*). The private burial-places for the ashes of the dead were usually by the side of the various roads leading into Rome, the Via Appia, the Via Flaminia, etc. The traveller to or from the city thus passed for miles an almost uninterrupted succession of tombstones, whose inscriptions usually began with the appropriate words *Siste, Viator*, or *Aspice, Viator*, the origin doubtless of the "Stop, Passenger," which still meets the eye in many parish churchyards of Britain. Another phrase of very common occurrence on ancient Roman tombstones, *Sit tibi terra levis*,—Light lie the earth upon thee,—has continued in frequent use, as conveying an appropriate sentiment, down to modern times. A remarkable feature of many of the Roman epitaphs was the terrible denunciation they often pronounced upon those who violated the sepulchre. Two impressive examples may be quoted:—

"Male pereat, Insepultus jaceat,
Non resurgat, Cum Juda partem habeat,
Si quis sepulcrum hunc violaverit."

The second is more refined, but not less terrible in its malediction:—

"Quisquis
Hoc Sustulerit aut læserit
Ultimus Suorum moriatur."

Such denunciations were not uncommon in later times. A well-known instance is furnished in the lines on Shakespeare's tomb at Stratford-on-Avon, said to have been written by the poet himself:—

"Good frend for Jesus sake forbeare,
To digg the dust enclosed heare;
Bleste be y^e man y^t spares thes stones
And curst be he y^t moves my bones."

The earliest existing British epitaphs belonged to the Roman period, and are written in Latin after the Roman form. Specimens are to be seen in various antiquarian museums throughout the country; some of the inscriptions are given in Bruce's *Roman Wall;* and the seventh volume of the *Corpus Inscriptionum Latinarum* edited by Hübner, containing the British inscriptions, is the most valuable repertory for the earlier Roman epitaphs in Britain. The earliest, of course, are commemorative of soldiers belonging to the legions of occupation, but the Roman form was afterwards adopted for native Britons. Long after the Roman form was discarded, the Latin language continued to be used, especially for inscriptions of a more public character, as being from its supposed permanence the most suitable medium of communication to distant ages. It is only, in fact, within recent years that Latin has become unusual, and the more natural practice has been adopted of writing the epitaphs of distinguished men in the language of the country in which they lived. While Latin was the chief if not the sole literary language, it was, as a matter of course, almost exclusively used for epitaphial inscriptions. The comparatively few English epitaphs that remain of the 11th and 12th centuries are all in Latin. They are generally confined to a mere statement of the name and rank of the deceased following the words "Hic jacet." Two noteworthy exceptions to this general brevity are, however, to be found in most of the collections. One is the epitaph to Gundrada, daughter of the Conqueror (d. 1085), which still exists at Lewes, though in an imperfect state, two of the lines having been lost; another is that to William de Warren, earl of Surrey (d. 1089), believed to have been inscribed in the Abbey of St. Pancras, near Lewes, founded by him. Both are encomiastic, and describe the character and work of the deceased with considerable fulness and beauty of expression. They are written in leonine verse. In the 13th century French began to be used in writing epitaphs, and most of the inscriptions to celebrated historical personages between 1200 and 1400 are in that language. Mention may be made of those to Robert, the third earl of Oxford (d. 1221), as given in Weever, to Henry III. (d. 1272) at Westminster Abbey, and to Edward the Black Prince (d. 1376) at Canterbury. In most of the inscriptions of this period the deceased addresses the reader in the first person, describes his rank and position while alive, and, as in the case of the Black Prince, contrasts it with his wasted and loathsome state in the grave, and warns the reader to prepare for the same inevitable change. The epitaph almost invariably closes with a request, sometimes very urgently worded, for the prayers of the reader that the soul of the deceased may pass to glory, and an invocation of blessing, general or specific, upon all who comply. Epitaphs preserved much of the same character after English began to be used towards the close of the 14th century. The following to a member of the Savile family at Thornhill is probably even earlier, though its precise date cannot be fixed:—

"Bonys emongg stonys lys ful
steyl gwylste the sawle wan-
deris were that God wylethe—"

that is, Bones among stones lie full still, whilst the soul wanders whither God willeth. It may be noted here that the majority of the inscriptions, Latin and English, from 1300 to the period of the Reformation, that have been preserved, are upon brasses. (See BRASSES, MONUMENTAL.)

It was in the reign of Elizabeth that epitaphs in English began to assume a distinct literary character and value, entitling them to rank with those that had hitherto been composed in Latin. There is one on the dowager countess of Pembroke (d. 1621), remarkable for its successful use of a somewhat daring hyperbole. It is usually attributed to Ben Jonson, but there seems reason to believe that it was written by William Browne, author of *Britannia's Pastorals*:—

"Underneath this marble hearse
Lies the subject of all verse;
Sidney's sister, Pembroke's mother;
Death, ere thou hast slain another
Fair and learn'd and good as she,
Time will throw his dart at thee.
Marble piles let no man raise
To her name for after days;
Some kind woman, born as she,
Reading this, like Niobe,
Shall turn marble, and become
Both her mourner and her tomb."

If there be something of the exaggeration of a conceit in the second stanza, it needs scarcely to be pointed out that epitaphs, like every other form of composition, necessarily reflect the literary characteristics of the age in which they were written. The deprecation of marble as unnecessary suggests one of the finest literary epitaphs in the English language, that by Milton upon Shakespeare:—

"What needs my Shakespeare, for his honored bones,
The labor of an age in piled stones?
Or that his hallowed reliques should be hid
Under a star-ypointing pyramid?
Dear Son of Memory, great heir of fame,
What need'st thou such weak witness of thy name?
Thou in our wonder and astonishment
Hast built thyself a live-long monument.
For whilst, to the shame of slow-endeavoring art,
Thy easy numbers flow; and that each heart
Hath, from the leaves of thy unvalued book,
Those Delphic lines with deep impression took;
Then thou our fancy of itself bereaving,
Dost make us marble with too much conceiving;
And so sepulchred, in such pomp dost lie,
That kings for such a tomb would wish to die."

The epitaphs of Pope are generally considered to possess very great literary merit, though they were rated higher by Johnson and critics of his period than they are now. Two are quoted in most collections as, each in its own way, a typical specimen. The first is on Mrs. Corbet:—

"Here rests a woman, good without pretense,
Blest with plain reason and with sober sense;
No conquests she, but o'er herself, desired,
No arts essayed, but not to be admired.
Passion and pride were to her soul unknown,
Convinced that virtue only is our own.
So unaffected, so composed a mind;
So firm, yet soft; so strong, yet so refined;
Heaven, as its purest gold, by tortures tried;
The saint sustained it, but the woman died."

The other, to Sir Isaac Newton, is not inscribed upon any monument:—

"Nature and Nature's laws lay hid in night;
God said, Let Newton be! and all was light."

Objection has been taken to it as "savoring of profanity,"—a criticism which will be differently estimated by different minds.

Dr. Johnson, who thought so much of Pope's epitaphs, was himself a great authority in both the theory and practice of this species of composition. His essay on epitaphs is one of the few existing monographs on the subject, and his opinion as to the use of Latin had great influence. The manner in which he met the delicately insinuated request of a number of eminent men that English should be employed in the case of Oliver Goldsmith was characteristic, and showed the strength of his conviction on the subject (see Boswell's *Life*, vol. vi. c. 7). The arguments in favor of Latin were chiefly drawn from its inherent fitness for epitaphial inscriptions and its classical stability. The first of these has a very considerable force, it being admitted on all hands that few languages are in themselves so suitable for the purpose; the second is outweighed by considerations that had considerable force in Dr. Johnson's time, and have acquired more since. Even to the learned Latin is no longer the language of daily thought and life as it was at the period of the Reformation, and the great body of those who may fairly claim to be called the well-educated classes can only read it with difficulty, if at all. It seems, therefore, little less than absurd, for the sake of a stability which is itself in great part delusive, to write epitaphs in a language unintelligible to the vast majority of those for whose information presumably they are intended. Though a stickler for Latin, Dr. Johnson wrote some very beautiful English epitaphs, as, for example, the following on Philips, a musician:—

"Philips, whose touch harmonious could remove
The pangs of guilty power or hapless love;
Rest here, distressed by poverty no more,
Here find that calm thou gav'st so oft before;
Sleep undisturbed within this peaceful shrine
Till angels wake thee with a note like thine!"

In classifying epitaphs various principles of division may be adopted. Arranged according to nationality they indicate distinctions of race less clearly perhaps than any other form of literature does,—and this obviously because when under the influence of the deepest feeling men think and speak very much in the same way whatever be their country. At the same time the influence of nationality may to some extent be traced in epitaphs. The characteristics of the French style, its grace, clearness, wit and epigrammatic point, are all recognizable in French epitaphs. Instances such as "*La première au rendezvous*," inscribed on the grave of a mother, Piron's epitaph written for himself after his rejection by the French Academy—

"Ci-gît Piron, qui ne fut jamais rien,
Pas même Académicien—"

and one by a relieved husband, to be seen at Père la Chase—

"Ci-gît ma femme. Ah! qu'elle est bien
Pour son repos et pour le mien—"

might be multiplied indefinitely. One can hardly look through a collection of English epitaphs without being struck with the fact that these represent a greater variety of intellectual and emotional states than those of any other nation, ranging through every style of thought from the sublime to the commonplace, every mood of feeling from the most delicate and touching to the coarse and even brutal. Few subordinate illustrations of the wonderfully complex nature of the English nationality are more striking than this.

Epitaphs are sometimes classified according to their authorship and sometimes according to their subject, but neither division is so interesting as that which arranges them according to their characteristic features. What has just been said of English epitaphs is, of course, more true of epitaphs generally. They exemplify every variety of sentiment and taste, from lofty pathos and dignified eulogy to coarse buffoonery and the vilest scurrility. The extent to which the humorous and even the low comic element prevails among them is a noteworthy circumstance. It is curious that the most solemn of all subjects should have been frequently treated, intentionally or unintentionally, in a style so ludicrous that a collection of epitaphs is generally one of the most amusing books that can be picked up. In this as in other cases too it is to be observed that the unintended humor is generally of a much more entertaining kind than that which has been deliberately perpetrated. It would be out of place to give here any specimens of a class of epitaphs which—just because they are the most amusing—are the most abundantly represented in all the ordinary collections.

See Weever, *Ancient Funerall Monuments*, 1631, 1661 (Tooke's edit., 1767); Philip Labbe, *Thesaurus epitaphiorum*, Paris, 1666; *Theatrum Funebre extructum a* Dodone Richea seu Ottone Aicher, 1675; Hackett, *Select and remarkable Epitaphs*, 1757; De la Place, *Recueil d'épitaphes*, 3 vol., Paris, 1782; Pulleyn, *Churchyard Gleanings*, c. 1830; L. EPITHALAMIUM (from *ἐπί*, and *θάλαμος*, a nuptial chamber), originally among the Greeks a song which was sung by a number of boys and girls at the door of the nuptial chamber. According to the scholiast on Theocritus, one form, the *κατακοιμητικόν*, was employed at night, and another, the *διεγερτικόν*, to amuse the bride and bridegroom on the following morning. In either case, as was natural, the main burden of the song consisted of invocations of blessing and predictions of happiness, interrupted from time to time by the ancient chorus of *Hymen hymenæe.* Among the Romans, a similar custom was in vogue, but the song was sung by girls only after the marriage guests had gone, and it contained much more of what modern morality would condemn as obscene. In the hands of the poets the epithalamium was developed into a special literary form, and received considerable cultivation. Sappho, Anacreon, Stesichorus, and Pindar are all regarded as masters of the species, but the finest example preserved in Greek literature is the 18th Idyll of Theocritus, which celebrates the marriage of Menelaus and Helena. Catullus, Statius, Ausonius, Sidonius Apollinaris, and Claudian are the authors of the best known epithalamia in classical Latin; and they have been imitated by Buchanan, Scaliger, Sannazarius, and a whole host of modern Latin poets, with whom, indeed, the form was at one time in great favor. The names of Ronsard, Malherbe, and Scarron are especially associated with the species in French literature, and Marini and Metastasio in Italian. Perhaps no poem of the class has been more universally admired than the epithalamium of Spenser, though he has found no unworthy rivals in Ben Jonson and one or two of his successors.

EPSOM, a market town in the county of Surrey, is situated about 14 miles S.W. of London, on a branch of the London and Brighton railway. The town is irregularly built, but contains some handsome new houses. The principal building is the parish church, a Gothic edifice, rebuilt in 1825, the interior of which contains some fine sculptures by Flaxman and Chantrey. Epsom has attained a wide celebrity on account of its mineral springs and its races. The former were discovered about 1618, and for some time after their discovery the town enjoyed a wonderful degree of prosperity. After the Restoration, it was often visited by Charles II., and when Queen Anne came to the throne, her husband, Prince George of Denmark, made it his frequent resort. Epsom gradually lost its celebrity as a spa, but the annual races held on its downs have arrested the decay of the town. Races appear to have been established here as early as James I.'s residence at Nonsuch, but they did not assume a permanent character until 1730. The principal races—the Derby and Oaks—are named after one of the earls of Derby, and his seat, the Oaks, which is in the neighborhood. The latter race was established in 1779, and the former in the following year. The spring races are held on a Thursday and Friday toward the close of April; and the great Epsom meeting takes place on the Tuesday and three following days immediately before Whitsuntide, —the Derby on the Wednesday and the Oaks on the Friday. The grand stand, erected in 1829, is 156 feet wide and 70 feet in depth, consists of three stories, accommodating nearly 5000 spectators, and includes a saloon 108 feet by 34. The population of the civil parish in 1871 was 6276.

EPSOM SALTS, the *magnesiæ sulphas* of pharmacy, and the epsomite or hair-salt of mineralogical treatises, is an hydrated magnesium sulphate, of the chemical constitution $MgSO_4.7H_2O$, and isomorphous with zinc sulphate (see vol. v. p. 456), which it resembles in appearance. The salt crystallizes in four-sided, right-rhombic, lustrous, colorless prisms, which in the commercial article are usually acicular in shape. It can be obtained also in crystals of the monoclinic system. It is very soluble, one part dissolving in 0·79 parts of water at 18·75° C., and has a bitter, saline, and cooling taste. The salt is prepared on the large scale by several methods, *e.g.*, by the treatment of the bittern of salt works with sulphuric acid or ferrous sulphate, by which the magnesium chloride of the liquid is converted into sulphate; by acting on magnesite, the native magnesium carbonate, or on magnesian limestone, with sulphuric acid, preferably, in the case of the latter substance, after the removal of the calcium carbonate by means of hydrochloric acid; and, as in the neighborhood of Genoa, by the roasting of pyritous serpentine, subsequent exposure to the air and lixiviation, peroxidization of ferrous salts by chlorine, precipitation of ferric oxide by burnt lime or dolomite, and evaporation of the resultant solution of magnesium sulphate. The mineral waters of Seidlitz, Saidschütz, Püllna, and of other places besides Epsom owe their potency to magnesium sulphate. The salt occurs in fibrous crusts of botryoidal masses in some limestone caves; in gypsum quarries, as a result of the action of the gypsum on magnesian limestone; and in the old workings of mines, where it is produced by the oxidation of pyrites in the presence of the magnesium compounds. As a hydragogue purgative, it is in common use; it is more especially valuable in febrile diseases, in congestion of the portal system, and in the obstinate constipation of painter's colic. To produce diuresis, the drug is far less frequently resorted to. It possesses the advantage of exercising but little irritant effect upon the bowels. In some cases, where full doses have failed, the repeated administration of small quantities has been found effectual. The chief application of Epsom salts or "Epsoms" is for weighting cotton-cloth. As a manure, magnesium sulphate has been chiefly employed as a top-dressing for clover-hay. The chlorides of magnesium and sodium and salts of iron and of calcium may occur as impurities in Epsom salts.

EQUATION. The present article includes DETERMINANT and THEORY OF EQUATIONS; and it may be proper to explain the relation to each other of the two subjects. Theory of equations is used in its ordinary conventional sense to denote the theory of a single equation of any order in one unknown quantity; that is, it does not include the theory of a system or systems of equations of any order between any number of unknown quantities. Such systems occur very frequently in analytical geometry and other parts of mathematics, but they are hardly as yet the subject-matter of a distinct theory; and even Elimination, the transition-process for passing from a system of any number of equations involving the same number of unknown quantities to a single equation in one unknown quantity, hardly belongs to the Theory of Equations in the above restricted sense. But there is one case of a system of equations which precedes the Theory of Equations, and indeed presents itself at the outset of algebra, that of a system of simple (or linear) equations. Such a system gives rise to the function called a Determinant, and it is by means of these functions that the solution of the equations is effected. We have thus the subject Determinant as nearly equivalent to (but somewhat more extensive than) that of a system of linear equations; and we have the other subject, Theory of Equations, used in the restricted sense above referred to, and as not including Elimination.

DETERMINANT.

1. A sketch of the history of determinants is given under ALGEBRA; it thereby appears that the algebraical function called a determinant presents itself in the solution of a system of simple equations, and we have herein a natural source of the theory. Thus, considering the equations

$$\begin{aligned} a\,x + b\,y + c\,z &= d\,, \\ a'x + b'y + c'z &= d'\,, \\ a''x + b''y + c''z &= d''\,, \end{aligned}$$

and proceeding to solve them by the so-called method of cross multiplication, we multiply the equations by factors selected in such a manner that upon adding the results the whole coefficient of y becomes $=0$, and the whole coefficient of z becomes $=0$; the factors in question are $b'c''-b''c'$, $b''c-bc''$, $bc'-b'c$ (values which, as at once seen, have the desired property); we thus obtain an equation which contains on the left-hand side only a multiple of x, and on the right-hand side a constant term; the coefficient of x has the value

$$a(b'c''-b''c')+a'(b''c-bc'')+a'(bc'-b'c),$$

and this function, represented in the form

$$\begin{vmatrix} a\,, & b\,, & c \\ a'\,, & b'\,, & c' \\ a''\,, & b''\,, & c'' \end{vmatrix},$$

is said to be a determinant; or, the number of elements being 3^2, it is called a determinant of the third order. It is to be noticed that the resulting equation is

$$\begin{vmatrix} a\,, & b\,, & c \\ a'\,, & b'\,, & c' \\ a''\,, & b''\,, & c'' \end{vmatrix} x = \begin{vmatrix} d\,, & b\,, & c \\ d'\,, & b'\,, & c' \\ d''\,, & b''\,, & c'' \end{vmatrix}$$

where the expression on the right-hand side is the like function with d, d', d'' in place of a, a', a'' respectively, and is of course also a determinant. Moreover, the functions $b'c''-b''c'$, $b''c-bc''$, $bc'-b'c$ used in the process are themselves the determinants of the second order

$$\begin{vmatrix} b'\,, & c' \\ b''\,, & c'' \end{vmatrix}, \begin{vmatrix} b''\,, & c'' \\ b\,, & c \end{vmatrix}, \begin{vmatrix} b\,, & c \\ b'\,, & c' \end{vmatrix}.$$

We have herein the suggestion of the rule for the derivation of the determinants of the orders 1, 2, 3, 4, etc., each from the preceding one, viz., we have

$$\begin{aligned}
&\begin{vmatrix} a \end{vmatrix} = a, \\
&\begin{vmatrix} a\,, & b \\ a'\,, & b' \end{vmatrix} = a\begin{vmatrix} b' \end{vmatrix} - a'\begin{vmatrix} b \end{vmatrix}, \\
&\begin{vmatrix} a\,, & b\,, & c \\ a'\,, & b'\,, & c' \\ a''\,, & b''\,, & c'' \end{vmatrix} = a\begin{vmatrix} b'\,, & c' \\ b''\,, & c'' \end{vmatrix} + a'\begin{vmatrix} b''\,, & c'' \\ b\,, & c \end{vmatrix} + a''\begin{vmatrix} b\,, & c \\ b'\,, & c' \end{vmatrix}, \\
&\begin{vmatrix} a\,, & b\,, & c\,, & d \\ a'\,, & b'\,, & c'\,, & d' \\ a''\,, & b''\,, & c''\,, & d'' \\ a'''\,, & b'''\,, & c'''\,, & d''' \end{vmatrix} = a\begin{vmatrix} b'\,, & c'\,, & d' \\ b''\,, & c''\,, & d'' \\ b'''\,, & c'''\,, & d''' \end{vmatrix} - a'\begin{vmatrix} b''\,, & c''\,, & d'' \\ b'''\,, & c'''\,, & d''' \\ b\,, & c\,, & d \end{vmatrix} \\
&\qquad\qquad + a''\begin{vmatrix} b'''\,, & c'''\,, & d''' \\ b\,, & c\,, & d \\ b'\,, & c'\,, & d' \end{vmatrix} - a'''\begin{vmatrix} b\,, & c\,, & d \\ b'\,, & c'\,, & d' \\ b''\,, & c''\,, & d'' \end{vmatrix},
\end{aligned}$$

and so on, the terms being all + for a determinant of an odd order, but alternately + and − for a determinant of an even order.

2. It is easy, by induction, to arrive at the general results:—

A determinant of the order n is the sum of the $1.2.3\ldots n$ products which can be formed with n elements out of n^2 elements arranged in the form of a square, no two of the n elements being in the same line or in the same column, and each such product having the coefficient ± unity.

The products in question may be obtained by permuting in every possible manner the columns (or the lines) of the determinant, and then taking for the factors the n elements in the dexter diagonal. And we thence derive the rule for the signs, viz., considering the primitive arrangement of the columns as positive, then an arrangement obtained therefrom by a single interchange (inversion, or derangement) of two columns is regarded as negative; and so in general an arrangement is positive or negative according as it is derived from the primitive arrangement by an even or an odd number of interchanges. [This implies the theorem that a given arrangement can be derived from the primitive arrangement only by an odd number, or else only by an even number of interchanges,—a theorem the verification of which may be easily obtained from the theorem (in fact a particular case of the general one), an arrangement can be derived from itself only by an even number of interchanges.] And this being so, each product has the sign belonging to the corresponding arrangement of the columns; in particular, a determinant contains with the sign + the product of the elements in its dexter diagonal. It is to be observed that the rule gives as many positive as negative arrangements, the number of each being $=\frac{1}{2}1.2\ldots n$.

The rule of signs may be expressed in a different form. Giving to the columns in the primitive arrangement the numbers $1, 2, 3\ldots n$, to obtain the sign belonging to any other arrangement we take, as often as a lower number succeeds a higher one, the sign −, and, compounding together all these minus signs, obtain the proper sign, + or − as the case may be.

Thus, for three columns, it appears by either rule that 123, 231, 312 are positive; 213, 321, 213 are negative; and the developed expression of the foregoing determinant of the third order is

$$= ab'c'' - ab''c' + a'b''c - a'bc'' + a''bc' - a''b'c.$$

3. It further appears that a determinant is a linear function[1] of the elements of each column thereof, and also a linear function of the elements of each line thereof; moreover, that the determinant retains the same value, only its sign being altered, when any two columns are interchanged, or when any two lines are interchanged; more generally, when the columns are permuted in any manner, or when the lines are permuted in any manner, the determinant retains its original value, with the sign + or − according as the new arrangement (considered as derived from the primitive arrangement) is positive or negative according to the foregoing rule of signs. It at once follows that, if two columns are identical, or if two lines are identical, the value of the determinant is $=0$. It may be added, that if the lines are converted into columns, and the columns into lines, in such a way as to leave the dexter diagonal unaltered, the value of the determinant is unaltered; the determinant is in this case said to be *transposed*.

4. By what precedes it appears that there exists a function of the n^2 elements, linear as regards the terms of each column (or say, for shortness, linear as to each column), and such that only the sign is altered when any two columns are interchanged; these properties completely determine the function, except as to a common factor which may multiply all the terms. If, to get rid of this arbitrary common factor, we assume that the product of the elements in the dexter diagonal has the coefficient $+1$, we have a complete definition of the determinant, and it is interesting to show how from these properties, assumed for the definition of the determinant, it at once appears that the determinant is a function serving for the solution of a system of linear equations. Observe that the properties show at once that if any column is $=0$ (that is, if the elements in the column are each $=0$), then the determinant is $=0$; and further, that if any two columns are identical, then the determinant is $=0$.

5. Reverting to the system of linear equations written down at the beginning of this article, consider the determinant

---

[1] The expression, a linear function, is here used in its narrowest sense, a linear function without constant term; what is meant is, that the determinant is in regard to the elements $a, a', a'', \ldots$ of any column or line thereof, a function of the form $Aa + A'a' + A''a'' + \ldots$, without any term independent of $a, a', a'' \ldots$

$$\begin{vmatrix} a\ x+b\ y+c\ z-d, & b, & c \\ a'x+b'y+c'z-d', & b', & c' \\ a''x+b''y+c''z-d'', & b'', & c'' \end{vmatrix};$$

it appears that this is

$$=x\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix}+y\begin{vmatrix} b, & b, & c \\ b', & b', & c' \\ b'', & b'', & c'' \end{vmatrix}+z\begin{vmatrix} c, & b, & c \\ c', & b', & c' \\ c'', & b'', & c'' \end{vmatrix}-\begin{vmatrix} d, & b, & c \\ d', & b', & c' \\ d'', & b'', & c'' \end{vmatrix},$$

viz., the second and third terms each vanishing, it is

$$=x\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix}-\begin{vmatrix} d, & b, & c \\ d', & b', & c' \\ d'', & b'', & c'' \end{vmatrix}.$$

But if the linear equations hold good, then the first column of the original determinant is $=0$, and therefore the determinant itself is $=0$; that is, the linear equations give

$$x\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix}-\begin{vmatrix} d, & b, & c \\ d', & b', & c' \\ d'', & b'', & c'' \end{vmatrix}=0;$$

which is the result obtained above.

We might in a similar way find the values of y and z, but there is a more symmetrical process. Join to the original equations the new equation

$$\alpha x+\beta y+\gamma z=\delta;$$

a like process shows that, the equations being satisfied, we have

$$\begin{vmatrix} \alpha, & \beta, & \gamma, & \delta \\ a, & b, & c, & d \\ a', & b', & c', & d' \\ a'', & b'', & c'', & d'' \end{vmatrix}=0;$$

or, as this may be written,

$$\begin{vmatrix} \alpha, & \beta, & \gamma & \\ a & b & c, & d \\ a' & b' & c', & d' \\ a'' & b'' & c'', & d'' \end{vmatrix}-\delta\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix}=0;$$

which, considering δ as standing herein for its value $\alpha x+\beta y+\gamma z$, is a consequence of the original equations only: we have thus an expression for $\alpha x+\beta y+\gamma z$, an arbitrary linear function of the unknown quantities x, y, z; and by comparing the coefficients of α, β, γ on the two sides respectively, we have the values of x, y, z; in fact, these quantities, each multiplied by

$$\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix},$$

are in the first instance obtained in the forms

$$\begin{vmatrix} 1 & & & \\ a, & b, & c, & d \\ a', & b', & c', & d' \\ a'', & b'', & c'', & d'' \end{vmatrix},\begin{vmatrix} & 1 & & \\ a, & b, & c, & d \\ a', & b', & c', & d' \\ a'', & b'', & c'', & d'' \end{vmatrix},\begin{vmatrix} & & 1 & \\ a, & b, & c, & d \\ a', & b', & c', & d' \\ a'', & b'', & c'', & d'' \end{vmatrix};$$

but these are

$$\begin{vmatrix} b, & c, & d \\ b', & c', & d' \\ b'', & c'', & d'' \end{vmatrix}, \begin{vmatrix} c, & d, & a \\ c', & d', & a' \\ c'', & d'', & a'' \end{vmatrix}, \begin{vmatrix} d, & a, & b \\ d', & a', & b' \\ d'', & a'', & b'' \end{vmatrix},$$

or, what is the same thing,

$$=\begin{vmatrix} b, & c, & d \\ b', & c', & d' \\ b'', & c'', & d'' \end{vmatrix}, \begin{vmatrix} c, & a, & d \\ c', & a', & d' \\ c'', & a'', & d'' \end{vmatrix}, \begin{vmatrix} a, & b, & d \\ a', & b', & d' \\ a'', & b'', & d'' \end{vmatrix}$$

respectively.

6. *Multiplication of two determinants of the same order.*—The theorem is obtained very easily from the last preceding definition of a determinant. It is most simply expressed thus—

$$\begin{array}{c|ccc|} & (\alpha, \alpha', \alpha''), & (\beta, \beta', \beta''), & (\gamma, \gamma', \gamma'') \\ (a\ , b\ , c\ ) & \text{“} & \text{“} & \text{“} \\ (a', b', c') & \text{“} & \text{“} & \text{“} \\ (a'', b'', c'') & \text{“} & \text{“} & \text{“} \end{array} = \begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix} . \begin{vmatrix} \alpha, & \beta, & \gamma \\ \alpha', & \beta', & \gamma' \\ \alpha'', & \beta'', & \gamma'' \end{vmatrix},$$

where the expression on the left side stands for a determinant, the terms of the first line being $(a, b, c)\ (\alpha, \alpha', \alpha'')$, that is, $a\alpha+b\alpha'+c\alpha''$, $(a, b, c)\ (\beta, \beta', \beta'')$, that is, $a\beta+b\beta'+c\beta''$, $(a, b, c,)\ (\gamma, \gamma', \gamma'')$, that is, $a\gamma+b\gamma'+c\gamma''$; and similarly the terms in the second and third lines are the like functions with (a', b', c') and (a'', b'', c'') respectively.

There is an apparently arbitrary transposition of lines and columns; the result would hold good if on the left-hand side we had written (α, β, γ), $(\alpha', \beta', \gamma')$, $(\alpha'', \beta'', \gamma'')$, or what is the same thing, if on the right-hand side we had transposed the second determinant; and either of these changes would, it might be thought, increase the elegance of the form, but, for a reason which need not be explained,[1] the form actually adopted is the preferable one.

To indicate the method of proof, observe that the determinant on the left-hand side, *qua* linear function of its columns, may be broken up into a sum of $(3^3=)$ 27 determinants, each of which is either of some such form as

$$\pm\alpha\beta\gamma'\begin{vmatrix} a, & a, & b \\ a', & a', & b' \\ a'', & a'', & b' \end{vmatrix},$$

where the term $\alpha\beta\gamma'$ is not a term of the $\alpha\beta\gamma$-determinant, and its coefficient (as a determinant with two identical columns) vanishes; or else it is of a form such as

$$\pm\alpha\beta'\gamma''\begin{vmatrix} a, & b, & c \\ a', & b', & c' \\ a'', & b'', & c'' \end{vmatrix},$$

that is, every term which does not vanish contains as a factor the *abc*-determinant last written down; the sum of all other factors $\pm\alpha\beta'\gamma''$ is the $\alpha\beta\gamma$-determinant of the formula; and the final result then is, that the determinant on the left-hand side is equal to the product on the right-hand side of the formula.

7. *Decomposition of a determinant into complementary determinants.*—Consider, for simplicity, a determinant of the fifth order, $5=2+3$, and let the top two lines be

$$\begin{matrix} a, & b, & c, & d, & e \\ a'; & b', & c', & d', & e' \end{matrix}$$

then, if we consider how these elements enter into the determinant, it is at once seen that they enter only through the determinants of the second order $\begin{vmatrix} a, & b \\ a', & b' \end{vmatrix}$, etc., which can be formed by selecting any two columns at pleasure. Moreover, representing the remaining three lines by

$$\begin{matrix} a'', & b'', & c'', & d'', & e'' \\ a''', & b''', & c''', & d''', & e''' \\ a'''', & b'''', & c'''', & d'''', & e'''' \end{matrix}$$

it is further seen that the factor which multiplies the determinant formed with any two columns of the first set is the determinant of the third order formed with the complementary three columns of the second set; and it thus appears that the determinant of the fifth order is a sum of all the products of the form

$$\pm\begin{vmatrix} a, & b \\ a', & b' \end{vmatrix}\begin{vmatrix} c'', & d'', & e'' \\ c''', & d''', & e''' \\ c'''', & d'''', & e'''' \end{vmatrix},$$

the sign $\pm$ being in each case such that the sign of the term $\pm ab'.\,c''d'''e''''$ obtained from the diagonal elements of the component determinants may be the actual sign of this term in the determinant of the fifth order; for the product written down the sign is obviously $+$.

Observe that for a determinant of the n-th order, taking the decomposition to be $1+(n-1)$, we fall back upon the equations given at the commencement, in order to show the genesis of a determinant.

8. Any determinant $\begin{vmatrix} a, & b \\ a', & b' \end{vmatrix}$ formed out of the elements of the original determinant, by selecting the lines and columns at pleasure, is termed a *minor* of the original determinant; and when the number of lines and columns, or order of the determinant, is $n-1$, then such determinant is called a *first minor;* the number of the first minors is $=n^2$, the first minors, in fact, corresponding to the several elements of the determinant—that is, the coefficient therein of any term whatever is the corresponding first minor. The first minors, each divided by the determinant itself, form a system of elements *inverse* to the elements of the determinant.

A determinant is *symmetrical* when every two elements symmetrically situated in regard to the dexter diagonal are equal to each other; if they are equal and opposite (that is, if the sum of the two elements be $=0$), this relation not extending to the diagonal elements themselves, which remain arbitrary, then the determinant is *skew;* but if the relation does extend to the diagonal terms (that is, if these are each $=0$), then the determinant is *skew symmetrical;* thus the determinants

---

[1] The reason is the connection with the corresponding theorem for the multiplication of two matrices.

$$\begin{vmatrix} a, & h, & g \\ h, & b, & f \\ g, & f, & c \end{vmatrix} ; \quad \begin{vmatrix} a, & \nu, & -\mu \\ -\nu, & b, & \lambda \\ \mu, & -\lambda, & c \end{vmatrix} ; \quad \begin{vmatrix} 0, & \nu, & -\mu \\ -\nu, & 0, & \lambda \\ \mu, & -\lambda, & 0 \end{vmatrix}$$

are respectively symmetrical, skew, and skew symmetrical.

The theory admits of very extensive algebraic developments and applications in algebraical geometry and other parts of mathematics; but the fundamental properties of the functions may fairly be considered as included in what precedes.

Theory of Equations.

9. In the subject "Theory of Equations" the term *equation* is used to denote an equation of the form $x^n - p_1x^{n-1} \ldots \pm p^n = 0$, where $p_1, p_2 \ldots p_n$ are regarded as known, and x as a quantity to be determined; for shortness the equation is written $f(x) = 0$.

The equation may be *numerical;* that is, the coefficients $p_1, p_2^n, \ldots p_n$ are then numbers,—understanding by number a quantity of the form $\alpha + \beta i$ (α and β having any positive or negative real values whatever, or say each of these is regarded as susceptible of continuous variation from an indefinitely large negative to an indefinitely large positive value), and i denoting $\sqrt{-1}$.

Or the equation may be *algebraical;* that is, the coefficients are not then restricted to denote, or are not explicitly considered as denoting, numbers.

I. We consider first numerical equations. (Real theory, 10 to 14; Imaginary theory, 15 to 18.)

10. Postponing all consideration of imaginaries, we take in the first instance the coefficients to be real, and attend only to the real roots (if any); that is, $p_1, p_2, \ldots p_n$ are real positive or negative quantities, and a root a, if it exists, is a positive or negative quantity such that $a^n - p_1a^{n-1} \ldots \pm p_n = 0$, or say, $f(a) = 0$. The fundamental theorems are given under ALGEBRA, sections x., xiii., xiv.; but there are various points in the theory which require further development.

It is very useful to consider the curve $y = f(x)$,—or, what would come to the same, the curve $Ay = f(x)$,—but it is better to retain the first-mentioned form of equation, drawing, if need be, the ordinate y on a reduced scale. For instance, if the given equation be $x^3 - 6x^2 + 11x - 6{\cdot}06 = 0$,[1] then the curve $y = x^3 - 6x^2 + 11x - 6{\cdot}06$ is as shown in the figure at page 444, without any reduction of scale for the ordinate.

It is clear that in general y is a continuous one-valued function of x, finite for every finite value of x, but becoming infinite when x is infinite; *i.e.*, assuming throughout that the coefficient of x^n is $+1$, then when $x = \infty$, $y = +\infty$; but when $x = -\infty$, then $y = +\infty$ or $-\infty$, according as n is even or odd; the curve cuts any line whatever, and in particular it cuts the axis (of x), in at most n points; and the value of x, at any point of intersection with the axis, is a root of the equation $f(x) = 0$.

If β, a are any two values of x ($a > \beta$, that is, a nearer $+\infty$), then if $f(\beta)$, $f(a)$ have opposite signs, the curve cuts the axis an odd number of times, and therefore at least once, between the points $x = \beta$, $x = a$; but if $f(\beta)$, $f(a)$ have the same sign, then between these points the curve cuts the axis an even number of times, or it may be not at all. That is, $f(\beta)$, $f(a)$ having opposite signs, there are between the limits β, a an odd number of real roots, and therefore at least one real root; but $f(\beta)$, $f(a)$ having the same sign, there are between these limits an even number of real roots, or it may be there is no real root. In particular by giving to β, a the values $-\infty$, $+\infty$ (or, what is the same thing, any two values sufficiently near to these values respectively) it appears that an equation of an odd order has always an odd number of real roots, and therefore at least one real root; but that an equation of an even order has an even number of real roots, or it may be no real root.

If a be such that for $x =$ or $> a$ (that is, x nearer to $+\infty$) $f(x)$ is always $+$, and β be such that for $x =$ or $< \beta$ (that is, x nearer to $-\infty$) $f(x)$ is always $-$, then the real roots (if any) lie between these limits, $x = \beta$, $x = a$; and it is easy to find by trial such two limits including between them all the real roots (if any).

11. Suppose that the positive value δ is an inferior limit to the difference between two real roots of the equation; or rather (since the foregoing expression would imply the existence of real roots) suppose that there are not two real roots such that their difference taken positively is $=$ or $< \delta$ then, γ being any value whatever, there is clearly at most one real root between the limits γ and $\gamma + \delta$; and by what precedes there is such real root or there is not such real root, according as $f(\gamma)$, $f(\gamma + \delta)$ have opposite signs or have the same sign. And by dividing in this manner the interval β to a into intervals each of which is $=$ or $< \delta$, we should not only ascertain the number of the real roots (if any), but we should also *separate* the real roots, that is, find for each of them limits γ, $\gamma + \delta$ between which there lies this one, and only this one, real root.

In particular cases it is frequently possible to ascertain the number of the real roots, and to effect their separation by trial or otherwise without much difficulty; but the foregoing was the general process as employed by Lagrange, even in the second edition (1808) of the *Traité de la résolution des Equations Numériques*;[2] the determination of the limit δ had to be effected by means of the "equation of differences" or equation of the order $\frac{1}{2}n(n-1)$, the roots of which are the squares of the differences of the roots of the given equation, and the process is a cumbrous and unsatisfactory one.

12. The great step was effected by Sturm's theorem (1835)—viz., here starting from the function $f(x)$, and its first derived function $f'(x)$, we have (by a process which is a slight modification of that for obtaining the greatest common measure of these two functions) to form a series of functions

$$f(x),\ f'(x),\ f_2(x)\ \ldots\ldots\ f_n(x)$$

of the degrees n, $n-1$, $n-2$ . . . . . 0 respectively,—the last term $f_n(x)$ being thus an absolute constant. These lead to the immediate determination of the number of real roots (if any) between any two given limits β, a; viz., supposing $a > \beta$ (that is, a nearer to $+\infty$), then substituting successively these two values in the series of functions, and attending only to the signs of the resulting values, the number of the changes of sign lost in passing from β to a is the required number of real roots between the two limits. In particular, taking β, $a = -\infty$, $+\infty$ respectively, the signs of the several functions depend merely on the signs of the terms which contain the highest powers of x, and are seen by inspection, and the theorem thus gives at once the whole number of real roots.

And although theoretically, in order to complete by a finite number of operations the separation of the real roots, we still need to know the value of the before-mentioned limit δ; yet in any given case the separation may be effected by a limited number of repetitions of the process. The practical difficulty is when two or more roots are very near to each other. Suppose, for instance, that the theorem shows that there are two roots between 0 and 10; by giving to x the values 1, 2, 3, . . . successively, it might appear that the two roots were between 5 and 6; then again that they were between 5·3 and 5·4, then between 5·34 and 5·35, and so on until we arrive at a separation; say it appears that between 5·346 and 5·347 there is one root, and between 5·348 and 5·349 the other root. But in the case in question δ would have a very small value, such as ·002, and even supposing this value known, the direct application of the first-mentioned process would be still more laborious.

13. Supposing the separation once effected, the determination of the single real root which lies between the two given limits may be effected to any required degree of approximation either by the processes of Horner and Lagrange (which are in principle a carrying out of the method of Sturm's theorem), or by the process of Newton, as perfected by Fourier (which requires to be separately considered).

First as to Horner and Lagrange. We know that between the limits β, a there lies one, and only one, real root of the equation; $f(\beta)$ and $f(a)$ have therefore opposite signs. Suppose any intermediate value is θ; in order to determine by Sturm's theorem whether the root lies between β, θ, or between θ, a, it would be quite unnecessary to calculate the signs of $f(\theta)$, $f'(\theta)$, $f_2(\theta)$ . . .; only the sign of $f(\theta)$ is required; for, if this has the same sign as $f(\beta)$, then the root is between β, θ; if the same sign as $f(a)$, then the root is between θ, a. We want to make θ increase from the inferior limit β, at which $f(\theta)$ has the sign of $f(\beta)$, so long as $f(\theta)$ retains this sign, and then to a value for which it assumes the opposite sign; we have thus two nearer limits of the required root, and the process may be repeated indefinitely.

---

[1] The coefficients were selected so that the roots might be nearly 1, 2, 3.

[2] The third edition (1826) is a reproduction of that of 1808; the first edition has the date 1798, but a large part of the contents is taken from memoirs of 1767–68 and 1770–71.

Horner's method (1819) gives the root as a decimal, figure by figure; thus if the equation be known to have one real root between 0 and 10, it is in effect shown say that 5 is too small (that is, the root is between 5 and 6); next that 5·4 is too small (that is, the root is between 5·4 and 5·5); and so on to any number of decimals. Each figure is obtained, *not* by the successive trial of all the figures which precede it, but (as in the ordinary process of the extraction of a square root, which is in fact Horner's process applied to this particular case) it is given presumptively as the first figure of a quotient; such value may be too large, and then the next inferior integer must be tried instead of it, or it may require to be further diminished. And it is to be remarked that the process not only gives the approximate value a of the root, but (as in the extraction of a square root) it includes the calculation of the function $f(a)$ which should be, and approximately is, $=0$. The arrangement of the calculations is very elegant, and forms an integral part of the actual method. It is to be observed that after a certain number of decimal places have been obtained, a good many more can be found by a mere division. It is in the progress tacitly assumed that the roots have been first separated.

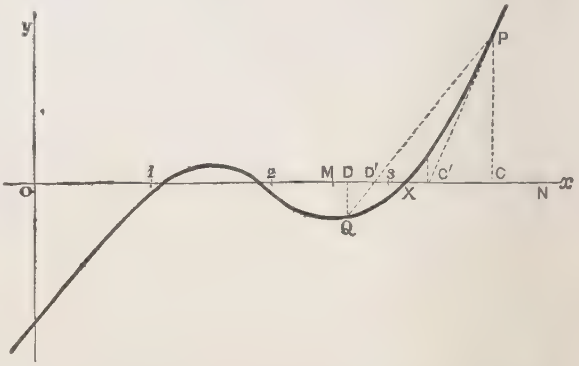
Lagrange's method (1767) gives the root as a continued fraction $a + \frac{1}{b+}\frac{1}{c+}\dots$, where a is a positive or negative integer (which may be $=0$), but $b, c, \dots$ are positive integers. Suppose the roots have been separated: then (by trial if need be of consecutive integer values) the limits may be made to be consecutive integer numbers: say they are a, $a+1$; the value of x is therefore $= a + \frac{1}{y}$, where y is positive and greater than 1; from the given equation for x, writing therein $x = a + \frac{1}{y}$, we form an equation of the same order for y, and this equation will have one, and only one, positive root greater than 1; hence finding for it the limits b, $b+1$ (where b is $=$ or >1), we have $y = b + \frac{1}{z}$, where z is positive and greater than 1; and so on—that is, we thus obtain the successive denominators $b, c, d \dots$ of the continued fraction. The method is theoretically very elegant, but the disadvantage is that it gives the result in the form of a continued fraction, which for the most part must ultimately be converted into a decimal. There is one advantage in the method, that a commensurable root (that is, a root equal to a rational fraction) is found accurately, since, when such root exists, the continued fraction terminates.

14. Newton's method (1711), as perfected by Fourier (1831), may be roughly stated as follows. If $x = \gamma$ be an approximate value of any root and $\gamma + h$ the correct value, then $f(\gamma + h) = 0$, that is,

$$f(\gamma) + \frac{h}{1}f'(\gamma) + \frac{h^2}{1\cdot 2}f''(\gamma) + \dots = 0;$$

and then, if h be so small that the terms after the second may be neglected, $f(\gamma) + hf'(\gamma) = 0$, that is, $h = -\frac{f(\gamma)}{f'(\gamma)}$, or the new approximate value is $x = \gamma - \frac{f(\gamma)}{f'(\gamma)}$; and so on, as often as we please. It will be observed that so far nothing has been assumed as to the separation of the roots, or even as to the existence of a real root; γ has been taken as the approximate value of a root, but no precise meaning has been attached to this expression. The question arises, what are the conditions to be satisfied by γ in order that the process may by successive repetitions actually lead to a certain real root of the equation; or say that, γ being an approximate value of a certain real root, the new value $\gamma - \frac{f(\gamma)}{f'(\gamma)}$ may be a more approximate value.

Referring to the figure, it is easy to see that if OC represent the assumed value γ, then, drawing the ordinate CP to meet the curve in P, and the tangent PC′ to meet the axis in C′, we shall have OC′ as the new approximate value of the root. But observe that there is here a real root OX, and that the curve beyond X is convex to the axis; under these conditions the point C′ is nearer to X than was C; and, starting with C′ instead of C, and proceeding in like manner to draw a new ordinate and tangent, and so on as often as we please, we approximate continually, and that with great rapidity, to the true value OX. But if C had been taken on the other side of X, where the curve is concave to the axis, the new point C′ might or might not be nearer to X than was the point C; and in this case the method, if it succeeds at all, does so by accident only—*i.e.*, it may happen that C′ or some subsequent point comes to be a point C, such that OC is a *proper* approximate value of the root, and then the subsequent approximations proceed in the same manner as if this value had been assumed in the first instance, all the preceding work being wasted. It thus appears that for the proper application of the method we require *more* than the mere separation of the roots. In order to be able to approximate to a certain root a, $=$ OX, we require to know that, between OX and some value ON, the curve is always convex to the axis (analytically, between the two values, $f(x)$ and $f''(x)$ must have always the same sign). When this is so, the point C may be taken anywhere on the proper side of X, and within the portion XN of the axis; and the process is then the one already explained. The approximation is in general a very rapid one. If we know for the required root OX the two limits OM, ON such that from M to X the curve is always *concave* to the axis, while from X to N it is always convex to the axis,—then taking D anywhere in the portion MX and (as before) C in the portion XN, drawing the ordinates DQ, CP, and joining the points P, Q by a line which meets the axis in D′, also constructing the point C′ by means of the tangent at P as before, we have for the required root the new limits OD′, OC′; and proceeding in like manner with the points D′, C′, and so on as often as we please, we obtain at each step two limits approximating more and more nearly to the required root OX. The process as to the point D′, translated into analysis, is the ordinate process of interpolation. Suppose OD $= \beta$, OC $= a$, we have approximately $f(\beta + h) = f(\beta) + \frac{h\{f(a) - f(\beta)\}}{a - \beta}$, whence if the root is $\beta + h$ then $h = -\frac{(a-\beta)f(\beta)}{f(a) - f(\beta)}$.



Returning for a moment to Horner's method, it may be remarked that the correction h, to an approximate value a, is therein found as a quotient the same or such as the quotient $f(a) \div f'(a)$ which presents itself in Newton's method. The difference is that with Horner the integer part of this quotient is taken as the presumptive value of h, and the figure is verified at each step. With Newton the quotient itself, developed to the proper number of decimal places, is taken as the value of h; if too many decimals are taken, there would be a waste of work; but the error would correct itself at the next step. Of course the calculation should be conducted without any such waste of work.

Next as to the theory of imaginaries.

15. It will be recollected that the expression *number* and the correlative epithet *numerical* were at the outset used in a wide sense, as extending to imaginaries. This extension arises out of the theory of equations by a process analogous to that by which number, in its original most restricted sense of positive integer number, was extended

to have the meaning of a real positive or negative magnitude susceptible of continuous variation.

If for a moment number is understood in its most restricted sense as meaning positive integer number, the solution of a simple equation leads to an extension; $ax-b=0$, gives $x=\frac{b}{a}$, a positive fraction, and we can in this manner represent, not accurately, but as nearly as we please, any positive magnitude whatever; so an equation $ax+b=0$ gives $x=-\frac{b}{a}$, which (approximately as before) represents any negative magnitude. We thus arrive at the extended signification of number as a continuously varying positive or negative magnitude. Such numbers may be added or subtracted, multiplied or divided one by another, and the result is always a number. Now from a quadric equation we derive, in like manner, the notion of a complex or imaginary number such as is spoken of above. The equation $x^2+1=0$ is not (in the foregoing sense, number = real number) satisfied by any numerical value whatever of x; but we assume that there is a number which we call i, satisfying the equation $i^2+1=0$; and then taking a and b any real numbers, we form an expression such as $a+bi$, and use the expression number in this extended sense: any two such numbers may be added or subtracted, multiplied or divided one by the other, and the result is always a number. And if we consider first a quadric equation $x^2+px+q=0$ where p and q are real numbers, and next the like equation, where p and q are any numbers whatever, it can be shown that there exists for x a numerical value which satisfies the equation; or, in other words, it can be shown that the equation has a numerical root. The like theorem, in fact, holds good for an equation of any order whatever; but suppose for a moment that this was not the case; say that there was a cubic equation $x^3+px^2+qx+r=0$, with numerical coefficients, not satisfied by any numerical value of x, we should have to establish a new imaginary j satisfying some such equation, and should then have to consider numbers of the form $a+bj$, or perhaps $a+bj+cj^2$ (a, b, c numbers $\alpha+\beta i$ of the kind heretofore considered),—first we should be thrown back on the quadric equation $x^2+px+q=0$, p and q being now numbers of the last-mentioned extended form—*non constat* that every such equation has a numerical root—and if not, we might be led to *other* imaginaries k, l, etc., and so on *ad infinitum* in inextricable confusion.

But in fact a numerical equation of any order whatever has always a numerical root, and thus numbers (in the foregoing sense, number = quantity of the form $\alpha+\beta i$) form (*what real numbers do not*) a universe complete in itself, such that starting in it we are never led out of it. There may very well be, and perhaps are, numbers in a more general sense of the term (quaternions are not a case in point, as the ordinary laws of combination are not adhered to), but in order to have to do with such numbers (if any) we must start with them.

16. The capital theorem as regards numerical equations thus is, every numerical equation has a numerical root; or for shortness (the meaning being as before), every equation has a root. Of course the theorem is the reverse of self-evident, and it requires proof; but provisionally assuming it as true, we derive from it the general theory of numerical equations. As the term root was introduced in the course of an explanation, it will be convenient to give here the formal definition.

A number a such that substituted for x it makes the function $x_1^n-p_1x^{n-1}\ldots\pm p_n$ to be $=0$, or say such that it satisfies the equation $f(x)=0$, is said to be a root of the equation; that is, a being a root, we have

$$a^n-p_1a^{n-1}\ldots\pm p_n=0,\text{ or say }f(a)=0;$$

and it is then easily shown that $x-a$ is a factor of the function $f(x)$, viz., that we have $f(x)=(x-a)\,f_1(x)$, where $f_1(x)$ is a function $x^{n-1}-q_1x^{n-2}\ldots\pm q_{n-1}$ of the order $n-1$, with numerical coefficients $q_1, q_2\ldots q_{n-1}$.

In general a is not a root of the equation $f_1(x)=0$, but it may be so—*i. e.*, $f_1(x)$ may contain the factor $x-a$; when this is so, $f(x)$ will contain the factor $(x-a)^2$; writing then $f(x)=(x-a)^2f_2(x)$, and assuming that a is not a root of the equation $f_2(x)=0$, $x=a$ is then said to be a double root of the equation $f(x)=0$; and similarly $f(x)$ may contain the factor $(x-a)^3$ and no higher power, and $x=a$ is then a triple root; and so on.

Supposing in general that $f(x)=(x-a)^\alpha\,\mathrm{F}(x)$ (α being a positive integer which may be $=1$, $(x-a)^\alpha$ the highest power of $x-a$ which divides $f(x)$, and $\mathrm{F}(x)$ being of course of the order $n-\alpha$), then the equation $\mathrm{F}(x)=0$ will have a root b which will be different from a; $x-b$ will be a factor, in general a simple one, but it may be a multiple one, of $\mathrm{F}(x)$, and $f(x)$ will in this case be $=(x-a)^\alpha(x-b)^\beta\,\Phi(x)$ (β a positive integer which may be $=1$, $(x-b)^\beta$ the highest power of $x-b$ in $\mathrm{F}(x)$ or $f(x)$, and $\Phi(x)$ being of course of the order $n-\alpha-\beta$). The original equation $f(x)=0$ is in this case said to have α roots each $=a$, β roots each $=b$; and so on for any other factors $(x-c)^\gamma$, etc.

We have thus the *theorem*—A numerical equation of the order n has in every case n roots, viz., there exist n numbers $a, b, \ldots$ (in general all distinct, but which may arrange themselves in any sets of equal values), such that $f(x)=(x-a)(x-b)(x-c)\ldots$ identically.

If the equation has equal roots, these can in general be determined, and the case is at any rate a special one which may be in the first instance excluded from consideration. It is, therefore, in general assumed that the equation $f(x)=0$ has all its roots unequal.

If the coefficients $p_1, p_2\ldots$ are all or any one or more of them imaginary, then the equation $f(x)=0$, separating the real and imaginary parts thereof, may be written $\mathrm{F}(x)+i\Phi(x)=0$, where $\mathrm{F}(x)$, $\Phi(x)$ are each of them a function with real coefficients; and it thus appears that the equation $f(x)=0$, with imaginary coefficients, has not in general any real root; supposing it to have a real root a, this must be at once a root of each of the equations $\mathrm{F}(x)=0$ and $\Phi(x)=0$.

But an equation with real coefficients may have as well imaginary as real roots, and we have further the *theorem* that for any such equation the imaginary roots enter in pairs, viz., $\alpha+\beta i$ being a root, then $\alpha-\beta i$ will be also a root. It follows that if the order be odd, there is always an odd number of real roots, and therefore at least one real root.

17. In the case of an equation with real coefficients, the question of the existence of real roots, and of their separation, has been already considered. In the general case of an equation with imaginary (it may be real) coefficients, the like question arises as to the situation of the (real or imaginary) roots; thus, if for facility of conception we regard the constituents α, β of a root $\alpha+\beta i$ as the co-ordinates of a point *in plano*, and accordingly represent the root by such point, then drawing in the plane any closed curve or "contour," the question is how many roots lie within such contour.

This is solved theoretically by means of a theorem of Cauchy's (1837), viz., writing in the original equation $x+iy$ in place of x, the function $f(x+iy)$ becomes $=\mathrm{P}+i\mathrm{Q}$, where P and Q are each of them a rational and integral function (with real coefficients) of (x, y). Imagining the point (x, y) to travel along the contour, and considering the number of changes of sign from $-$ to $+$ and from $+$ to $-$ of the fraction corresponding to passages of the fraction through zero (that is, to values for which P becomes $=0$, disregarding those for which Q becomes $=0$), the difference of these numbers gives the number of roots within the contour.

It is important to remark that the demonstration does not presuppose the existence of any root; the contour may be the infinity of the plane (such infinity regarded as a contour, or closed curve), and in this case it can be shown (and that very easily) that the difference of the numbers of changes of sign is $=n$; that is, there are within the infinite contour, or (what is the same thing) there are in all n roots; thus Cauchy's theorem contains really the proof of the fundamental theorem that a numerical equation of the nth order (not only has a numerical root, but) has precisely n roots. It would appear that this proof of the fundamental theorem in its most complete form is in principle identical with Gauss's last proof (1849) of the theorem, in the form—A numerical equation of the nth order has always a root.[1]

But in the case of a finite contour, the actual determination of the difference which gives the number of real roots can be effected only in the case of a rectangular contour, by applying to each of its sides separately a method such as that of Sturm's theorem; and thus the actual determination ultimately depends on a method such as that of Sturm's theorem.

---

[1] The earlier demonstrations by Euler, Lagrange, etc., relate to the case of a numerical equation with real coefficients; and they consist in showing that such equation has always a real quadratic divisor, furnishing two roots, which are (either real or else conjugate imaginaries $\alpha+\beta i$ (see Lagrange's *Équations Numériques*).

Very little has been done in regard to the calculation of the imaginary roots of an equation by approximation; and the question is not here considered.

18. A class of numerical equations which needs to be considered is that of the binomial equations $x^n - a = 0$ ($a = \alpha + \beta i$, a complex number). The foregoing conclusions apply, viz., there are always n roots, which, it may be shown, are all unequal. And these can be found numerically by the extraction of the square root, and of an nth root, of *real* numbers, and by the aid of a table of natural sines and cosines.[1] For writing

$$\alpha + \beta i = \sqrt{\alpha^2 + \beta^2}\left\{\frac{\alpha}{\sqrt{\alpha^2 + \beta^2}} + \frac{\beta}{\sqrt{\alpha^2 + \beta^2}}i\right\},$$

there is always a real angle λ (positive and less than 2π), such that its cosine and sine are $= \frac{\alpha}{\sqrt{\alpha^2 + \beta^2}}$ and $\frac{\beta}{\sqrt{\alpha^2 + \beta^2}}$ respectively; that is, writing for shortness $\sqrt{\alpha^2 + \beta^2} = \rho$, we have $\alpha + \beta i = \rho\,(\cos\lambda + i\sin\lambda)$, or the equation is $x^n = \rho(\cos\lambda + i\sin\lambda)$; hence observing that $\left(\cos\frac{\lambda}{n} + i\sin\frac{\lambda}{n}\right)^n = \cos\lambda + i\sin\lambda$, a value of x is $= \sqrt[n]{\rho}\left(\cos\frac{\lambda}{n} + i\sin\frac{\lambda}{n}\right)$. The formula really gives all the roots, for instead of λ we may write $\lambda + 2s\pi$, s a positive or negative integer, and then we have

$$x = \sqrt[n]{\rho}\left(\cos\frac{\lambda + 2s\pi}{n} + i\sin\frac{\lambda + 2s\pi}{n}\right),$$

which has the n values obtained by giving to s the values $0, 1, 2 \ldots n-1$ in succession; the roots are, it is clear, represented by points lying at equal intervals on a circle. But it is more convenient to proceed somewhat differently; taking one of the roots to be θ, so that $\theta^n = a$, then assuming $x = \theta y$, the equation becomes $y^n - 1 = 0$, which equation, like the original equation, has precisely n roots (one of them being of course $= 1$). And the original equation $x^n - a = 0$ is thus reduced to the more simple equation $x^n - 1 = 0$; and although the theory of this equation is included in the preceding one, yet it is proper to state it separately.

The equation $x^n - 1 = 0$ has its several roots expressed in the form $1, \omega, \omega^2, \ldots \omega^{n-1}$, where ω may be taken $= \cos\frac{2\pi}{n} + i\sin\frac{2\pi}{n}$; in fact, ω having this value, any integer power ω^k is $= \cos\frac{2\pi k}{n} + i\sin\frac{2\pi k}{n}$, and we thence have $(\omega^k)^n = \cos 2\pi k + i\sin 2\pi k, = 1$, that is, ω^k is a root of the equation. The theory will be resumed further on.

By what precedes, we are led to the notion (a numerical) of the radical $a^{\frac{1}{n}}$ regarded as an n-valued function; any one of these being denoted by $\sqrt[n]{a}$, then the series of values is $\sqrt[n]{a}, \omega\sqrt[n]{a}, \ldots \omega^{n-1}\sqrt[n]{a}$; or we may, if we please, use $\sqrt[n]{a}$ instead of $a^{\frac{1}{n}}$ as a symbol to denote the n-valued function.

As the coefficients of an algebraical equation may be numerical, all which follows in regard to algebraical equations is (with, it may be, some few modifications) applicable to numerical equations; and hence, concluding for the present this subject, it will be convenient to pass on to algebraical equations.

II. We consider secondly algebraical equations (19 to 34).

19. The equation is

$$x^n - p_1x^{n-1} + \ldots \pm p_n = 0,$$

and we here *assume* the existence of roots, viz., we assume that there are n quantities $a, b, c \ldots$ (in general all of them different, but which in particular cases may become equal in sets in any manner), such that

$$x^n - p_1x^{n-1} + \ldots \pm p_n - 0;$$

or looking at the question in a different point of view, and starting with the roots $a, b, c \ldots$ as given, we express the product of the n factors $x - a, x - b, \ldots$ in the foregoing form, and thus arrive at an equation of the order n having the n roots $a, b, c \ldots$ In either case we have

$$p_1 = \Sigma a,\ p_2 = \Sigma ab, \ldots p_n = abc \ldots;$$

i.e., regarding the coefficients $p_1, p_2 \ldots p_n$ as given, then we assume the existence of roots $a, b, c, \ldots$ such that $p_1 = \Sigma a$, etc.; or, regarding the roots as given, then we write p_1, p_2, etc., to denote the functions Σa, Σab, etc.

As already explained, the epithet algebraical is not used in opposition to numerical; an algebraical equation is merely an equation wherein the coefficients are not restricted to denote, or are not explicitly considered as denoting, numbers. That the abstraction is legitimate, appears by the simplest example; in saying that the equation $x^2 - px + q = 0$ has a root $x - \frac{1}{2}(p + \sqrt{p^2 - 4q})$, we mean that writing this value for x the equation becomes an identity, $\{\frac{1}{2}(p + \sqrt{p^2 - 4q})\}^2 - p\{\frac{1}{2}(p + \sqrt{p^2 - 4q}\} + q = 0$; and the verification of this identity in nowise depends upon p and q meaning numbers. But if it be asked what there is beyond numerical equations included in the term algebraical equation, or, again, what is the full extent of the meaning attributed to the term—the latter question at any rate it would be very difficult to answer; as to the former one, it may be said that the coefficients may, for instance, be symbols of operation. As regards such equations, there is certainly no proof that every equation has a root, or that an equation of the nth order has n roots; nor is it in any wise clear what the precise signification of the statement is. But it is found that the assumption of the existence of the n roots can be made without contradictory results; conclusions derived from it, if they involve the roots, rest on the same ground as the original assumption; but the conclusion may be independent of the roots altogether, and in this case it is undoubtedly valid; the reasoning, although actually conducted by aid of the assumption (and, it may be, most easily and elegantly in this manner), is really independent of the assumption. In illustration, we observe that it is allowable to express a function of p and q as follows,—that is, by means of a rational symmetrical function of a and b: this can, as a fact, be expressed as a rational function of $a + b$ and ab; and if we prescribe that $a + b$ and ab shall then be changed into p and q respectively, we have the required function of p, q. That is, we have F (α, β) as a representation of $f\,(p, q)$, obtained as if we had $p = a + b$ $q = ab$, but without in any wise assuming the existence of the a, b of these equations.

20. Starting from the equation

$$x^n - p_1x^{n-1} + \ldots = x - a.x - b., \text{ etc.}$$

or the equivalent equations $p_1 = \Sigma a$, etc., we find

$$\begin{aligned} a^n - p_1a^{n-1} + \ldots &= 0, \\ b^n - p_1b^{n-1} + \ldots &= 0; \\ \vdots \quad\quad \vdots \quad\quad &\ \ \vdots \end{aligned}$$

(it is as satisfying these equations that $a, b \ldots$ are said to be the roots of $x^n - p_1x^{n-1} + \ldots = 0$); and conversely from the last-mentioned equations, assuming that $a, b \ldots$ are all different, we deduce

$$p_1 = \Sigma a,\ p_2 = \Sigma ab, \text{ etc.},$$

and

$$x^n - p_1x^{n-1} + \ldots = x - a.x - b., \text{ etc.}$$

Observe that if, for instance, $a = b$, then the equations $a^n - p_1a^{n-1} + \ldots = 0$, $b^n - p_1b^{n-1} + = 0$ would reduce themselves to a single relation, which would not of itself express that a was a double root,—that is, that $(x - a)^2$ was a factor of $x^n - p_1x^{n-1} +$, etc.; but by considering b as the limit of $a + h$, h indefinitely small, we obtain a second equation

$$na^{n-1} - (n-1)p_1a^{n-2} + \ldots = 0,$$

which, with the first, expresses that a is a double root; and then the whole system of equations leads as before to the equations $p_1 = \Sigma a$, etc. But the existence of a double root implies a certain relation between the co-efficients; the general case is when the roots are all unequal.

We have then the *theorem* that every rational symmetrical function of the roots is a rational function of the coefficients. This is an easy consequence from the less general theorem, every rational and integral symmetrical function of the roots is a rational and integral function of the coefficients.

---

[1] The square root of $\alpha + \beta i$ can be determined by the extraction of square roots of positive real numbers, without the trigonometrical tables.

In particular, the sums of the powers Σa^2, Σa^3, etc., are rational and integral functions of the coefficients.

The process originally employed for the expression of other functions $\Sigma a^\alpha b^\beta$, etc., in terms of the coefficients is to make them depend upon the sums of powers; for instance, $\Sigma a^\alpha b^\beta = \Sigma a^\alpha \, \Sigma a^\beta - \Sigma a^{\alpha+\beta}$; but this is very objectionable; the true theory consists in showing that we have systems of equations

$$\begin{aligned} p_1 &= \Sigma a\,, \\ \begin{cases} p_2 &= \Sigma ab\,, \\ p_1^2 &= \Sigma a^2 + 2\Sigma ab\,, \end{cases} \\ \begin{cases} p_3 &= \Sigma abc\,, \\ p_1p_2 &= \Sigma a^2b + 3\Sigma abc\,, \\ p_1^3 &= \Sigma a^3 + 3\Sigma a^2b + 6\Sigma abc\,, \end{cases} \end{aligned}$$

where in each system there are precisely as many equations as there are root-functions on the right-hand side—*e.g.*, 3 equations and 3 functions Σabc, Σa^2b, Σa^3. Hence in each system the root-functions can be determined linearly in terms of the powers and products of the coefficients:

$$\begin{aligned} \begin{cases} \Sigma ab &= p_2\,, \\ \Sigma a^2 &= p_1^2 - 2p_2\,, \end{cases} \\ \begin{cases} \Sigma abc &= p_3\,, \\ \Sigma a^2b &= p_1p_2 - 3p_3\,, \\ \Sigma a^3 &= p_1^3 - 3p_1p_2 + 3p_3\,, \end{cases} \end{aligned}$$

and so on. The older process, if applied consistently, would derive the originally assumed value $\Sigma ab, = p_2$, from the two equations $\Sigma a = p$, $\Sigma a^2 = p_1^2 - 2p_2$; *i.e.*, we have $2\Sigma ab = \Sigma a . \Sigma a - \Sigma a^2, = p_1^2 - (p_1^2 - 2p_2), = 2p_2$.

21. It is convenient to mention here the theorem that, x being determined as above by an equation of the order n, any rational and integral function whatever of x, or more generally any rational function which does not become infinite in virtue of the equation itself, can be expressed as a rational and integral function of x, of the order $n-1$, the coefficients being rational functions of the coefficients of the equation. Thus the equation gives x^n a function of the form in question; multiplying each side by x, and on the right-hand side writing for x^n its foregoing value, we have x^{n+1}, a function of the form in question; and the like for any higher power of x, and therefore also for any rational and integral function of x. The proof in the case of a rational non-integral function is somewhat more complicated. The final result is of the form $\frac{\Phi(x)}{\psi(x)} = \mathrm{I}(x)$, or say $\Phi(x) - \psi(x)\mathrm{I}(x) = 0$, where Φ, ψ, I are rational and integral functions; in other words, this equation, being true if only $f(x) = 0$, can only be so by reason that the left-hand side contains $f(x)$ as a factor, or we must have identically $\Phi(x) - \psi(x)\mathrm{I}(x) = \mathrm{M}(x)f(x)$. And it is, moreover, clear that the equation $\frac{\Phi(x)}{\psi(x)} = \mathrm{I}(x)$, being satisfied if only $f(x) = 0$, must be satisfied by each root of the equation.

From the theorem that a rational symmetrical function of the roots is expressible in terms of the coefficients, it at once follows that it is possible to determine an equation (of an assignable order) having for its roots the several values of any given (unsymmetrical) function of the roots of the given equation. For example, in the case of a quartic equation, roots (a, b, c, d), it is possible to find an equation having the roots ab, ac, ad, bc, bd, cd (being therefore a sextic equation): viz., in the product

$$(y-ab)(y-ac)(y-ad)(y-bc)(y-bd)(y-cd)$$

the coefficients of the several powers of y will be symmetrical functions of a, b, c, d and therefore rational and integral functions of the coefficients of the quartic equation; hence, supposing the product so expressed, and equating it to zero, we have the required sextic equation. In the same manner can be found the sextic equation having the roots $(a-b^2)$, $(a-c^2)$, $(a-d^2)$, $(b-c^2)$, $(b-d^2)$, $(c-d^2)$, which is the equation of differences previously referred to; and similarly we obtain the equation of differences for a given equation of any order. Again, the equation sought for may be that having for its n roots the given rational functions $\Phi(a)$, $\Phi(b)$, .. of the several roots of the given equation. Any such rational function can (as was shown) be expressed as a rational and integral function of the order $n-1$; and, retaining x in place of any one of the roots, the problem is to find y from the equations $x^n - p_1x^{n-1} .. = 0$, and $y = \mathrm{M}_0x^{n-1} + \mathrm{M}_1x^{n-2} + ..$, or, what is the same thing, from these two equations to eliminate x. This is in fact Tschirnhausen's transformation (1683).

22. In connection with what precedes, the question arises as to the number of values (obtained by permutations of the roots) of given unsymmetrical functions of the roots, or say of a given set of letters: for instance, with roots or letters (a, b, c, d) as before, how many values are there of the function $ab+cd$, or better, how many functions are there of this form? The answer is 3, viz., $ab+cd$, $ac+bd$, $ad+bc$; or again we may ask whether, in the case of a given number of letters, there exist functions with a given number of values, 3-valued, 4-valued functions, etc.

It is at once seen that for any given number of letters there exist 2-valued functions; the product of the differences of the letters is such a function; however the letters are interchanged, it alters only its sign; or say the two values are $\Delta, -\Delta$. And if P, Q are symmetrical functions of the letters, then the general form of such a function is $\mathrm{P} + \mathrm{Q}\Delta$; this has only the two values $\mathrm{P}+\mathrm{Q}\Delta$, $\mathrm{P}-\mathrm{Q}\Delta$.

In the case of 4 letters there exist (as appears above) 3-valued functions: but in the case of 5 letters there does not exist any 3-valued or 4-valued function; and the only 5-valued functions are those which are symmetrical in regard to four of the letters, and can thus be expressed in terms of one letter and of symmetrical functions of all the letters. These last theorems present themselves in the demonstration of the non-existence of a solution of a quintic equation by radicals.

The theory is an extensive and important one, depending on the notions of *substitutions* and of *groups*.[1]

23. Returning to equations, we have the very important theorem that, given the value of any unsymmetrical function of the roots, *e.g.*, in the case of a quartic equation, the function $ab+cd$, it is in general possible to determine rationally the value of any similar function, such as $(a+b)^3+(c+d)^3$.

The *a priori* ground of this theorem may be illustrated by means of a numerical equation. Suppose that the roots of a quartic equation are 1, 2, 3, 4, then if it is given that $ab+cd = 14$, this in effect determines a, b to be 1, 2 and c, d to be 3, 4 (viz. $a=1$, $b=2$ or $a=2$, $b=1$, and $c=3$, $d=4$ or $c=3$, $d=4$) or else a, b to be 3, 4 and c, d to be 1, 2; and it therefore in effect determines $(a+b)^3+(c+d)^3$ to be $=370$, and not any other value; that is, $(a+b)^3+(c+d)^3$, as having a single value, must be determinable rationally. And we can in the same way account for cases of failure as regards particular equations; thus, the roots being 1, 2, 3, 4 as before, $a^2b=2$ determines a to $b=1$ and b to $b=2$; but if the roots had been 1, 2, 4, 16 then $a^2b=16$ does not uniquely determine a, b, but only makes them to be 1,16 or 2,4 respectively.

As to the *a posteriori* proof, assume for instance,

$$\begin{aligned} t_1 &= ab+cd, & y_1 &= (a+b)^3+(c+d)^3, \\ t_2 &= ac+bd, & y_2 &= (a+c)^3+(b+d)^3, \\ t_3 &= ad+bc, & y_3 &= (a+d)^3+b+c)^3: \end{aligned}$$

then $y_1+y_2+y_3$, $t_1y_1+t_2y_2+t_3y_3$, $t_1^2y_1+t_2^2y_2+t_3^2y_3$ will be respectively symmetrical functions of the roots of the quartic, and therefore rational and integral functions of the coefficients; that is, they will be known.

---

[1] A substitution is the operation by which we pass from the primitive arrangement of n letters to any other arrangement of the same letters: for instance, the substitution $\binom{bcda}{abcd}$ means that a is to be changed into b, b into c, c into d, d into a. Substitutions may, of course, be represented by single letters α, β, . . ; $\binom{abcd}{abcd}, = 1$, is the substitution which leaves the letters unaltered. Two or more substitutions may be compounded together and give rise to a substitution; *i. e.*, performing upon the primitive arrangement first the substitution β and then upon the result the substitution α, we have the substitution $\alpha\beta$. Substitutions are not commutative; thus, $\alpha\beta$ is not in general $= \beta\alpha$; but they are associative, $\alpha\beta.\gamma = \alpha.\beta\gamma$, so that $\alpha\beta\gamma$ has a determinate meaning. A substitution may be compounded any number of times with itself, and we thus have the powers α^2, α^3 . . , etc. Since the number of substitutions is limited, some power α^ν must be $=1$, or as this may be expressed every substitution is a root of unity. A group of substitutions is a set such that each two of them compounded together in either order gives a substitution belonging to the set; every group includes the substitution unity, so that we may in general speak of a group $1, \alpha, \beta$, . . (the number of terms is the order of the group). The whole system of the $1.2.3 \ldots n$ substitutions which can be performed upon the n letters is obviously a group: the order of every other group which can be formed out of these substitutions is a submultiple of this number; but it is not conversely true that a group exists the order of which is any given submultiple of this number. In the case of a determinant the substitutions which give rise to the positive terms form a group the order of which is $= \frac{1}{2}1.2.3 \ldots n$. For any function of the n-letters, the whole series of substitutions which leave the value of the functions unaltered form a group; and thence also the number of values of the function is $= 1.2.3 \ldots n$ divided by the order of the group.
